The International Red Cross Committee at Geneva has addressed a protest to the German Government in reference to its order of Jan 29th regarding the sinking of hospital ships and the sequel to this order —

> The International Committee whose right and duty it is to enforce respect for the principles of the Red Cross and the Geneva Convention by reporting violations of them draws the very serious attention of the German Government to the responsibility which it would assume towards the civilised world by persisting in a resolution which is in contradiction to the humanitarian conventions which it has pledged itself solemnly to respect
>
> In torpedoing hospital ships it is not attacking combatants but defenceless beings wounded or mutilated in war and women who are devoting themselves to the work of relief and charity Every hospital ship is provided with the external signs prescribed by international conventions, the use of which has been regularly notified to belligerents and should be respected by belligerents. The latter may according to the Hague Convention exercise the right of search, but have in no case any right to sink a ship and expose to death the hospital staff and the wounded
>
> The *Asturias* appears to have been torpedoed without any care having been taken to ascertain her character or her destination Even if the correctness of the facts were admitted upon which Germany bases justification of her order the International Committee considers that nothing can excuse the torpedoing of a hospital ship and expresses the hope that such an order contrary to international conventions will cease to be carried out

MEDICAL MOBILISATION IN AMERICA

A practical spirit pervades the preparations which are being made by the medical profession in America for the emergencies of war A recent number of the *New York Medical Journal* states the statistical side of the problem —

> Our regular army now numbers 125,000 men, and the National Guard about 160 000 If recruited to full war strength they would number 280 000 and 440 000 respectively or a total of 720 000 For this army some 5000 medical officers would be required In addition to this we have another army of 500 000 called to the colours for training making a first line defence of 1 220 000 men In addition it is expected that at least a million and a half more troops will be called out during the year for training making a total of 2,720 000 troops under arms Such an army would require 19 000 medical officers We now have in the regular army about 1200 medical officers and in the National Guard about as many more making about 2400 officers and leaving a deficiency of 16,600 medical officers to be supplied from civil life In view of the fact that we have in the United States only 145 000 registered physicians it will be seen that the new army will face a deficiency in a direction in which it will be difficult to improvise aid

On the basis of the latest figures the number of registered medical men in the United States in 1916 was 145 241 and in the dependencies 1372 while the number of students qualifying during each of the last two years has been in the neighbourhood of 3000 With 3000 young men on the point of graduating and 2500 senior students, in addition to a large number of recently qualified men holding hospital appointments or just started in practices the deficiency of 16 000 medical officers can in large part promptly be made good The majority of these men will be in a position to join one or other branch of the medical service, while senior men will be required to fill places in the special branches of preventive medicine which form an essential part of the modern medical service Special arrangements have been made excusing senior students on enrolment the completion of their current term of study

The whole medical service of the war will be carried on under the supervision of the Council of National Defence, a body created last August to secure the effective coördination of industry and material resources in the interests of national security and welfare The Council consists of the Secretaries of State for War, the Navy, the Interior, Agriculture, Commerce and Labour, assisted by an Advisory Commission (nominated by the Council) of seven civilians appointed by the Federal President Each member of the Commission appoints a committee or board representative of the activities for which he is responsible The medical representative is Dr Franklin H Martin, who presides over a committee the other members of which are Surgeon General William C Gorgas, U S Army Surgeon General William C Braisted, U S Navy, Surgeon General Rupert Blue, Public Health Service, Colonel Jefferson R Kean, Director General of Military Relief of the American Red Cross, Dr William H Welch, member of the National Council of Research, Dr William J Mayo chairman of the Committee of American Physicians for Medical Preparedness, Dr Frank F Simpson, chief of the Medical Section of the Council for National Defence and Secretary of the Committee of American Physicians for Preparedness This medical committee owes its inception early last year to the joint action of the American Medical Association, the American Surgical Association, the Congress of American Physicians and Surgeons, the Clinical Congress of Surgeons of North America, and the American College of Surgeons It has already done much excellent work, including the selection of some 20,000 medical men classified according to their training and the kind of work for which they are best fitted In order to facilitate the examination of recruits and release officers of the regular Army from such work a board of officers from the Medical Officers Reserve will be in session at the New York Academy of Medicine to examine candidates for the medical services and initiate them in the details of this work.

The preparatory work of organising and equipping base hospital units was taken in hand by the American Red Cross some months ago, and 22 units are now ready for service at any moment, while 7 others are on the point of completion Each hospital will contain 500 beds There have been enrolled 3000 trained nurses for active service and more than 1000 medical men, as well as over 4000 women with an elementary knowledge of first aid and hygiene, who will be able to assist the trained nurses The first naval base hospital stationed at Brooklyn is equipped for 250 beds and has been ordered to hold itself in readiness for active service

The Rockefeller Institute is experimenting with a portable military hospital unit with accommodation for 200 patients to be used as a surgical clinic It is proposed to place it in the charge of Dr Carrel and Dr Dakin to assist in the introduction of the methods of these surgeons as carried out in the French military hospitals

The War Refugees' Dispensary

The Committee of the War Refugees Dispensary, which has recently been closed, has sent in its final report to the War Refugees' Committee, of whose work it formed a branch and by which it was financed Instituted in October, 1914, by four English and three Belgian doctors, with the assistance of a Voluntary Aid Detachment, this dispensary continued its activities at 265 Strand, London, W C, as an out-patient department for refugees until early in the present year, when, owing to progressive difficulties both in staffing and financing it was closed and the work handed over to the Government Dispensary in Sheffield street, W C During the two and a quarter years of its existence nearly 29 000 consultations and treatments were given with a daily average of 52 attendances Medical cases predominated, but a considerable proportion of surgical, skin, nose throat, ear, and other affections were dealt with Patients to the number of over 400 requiring treatment beyond the scope of the dispensary were passed on to out-patient departments of suitable hospitals and 124 placed as in patients Besides this over 1200 introductions for ophthalmic treatment were given, and 420 pairs of spectacles supplied free or partially free Upwards of 1000 dental cases were treated by a private dentist, who most liberally and kindly placed his services at the disposal of the Committee, and nearly 500 received hospital treatment Artificial teeth and repairs free or assisted, were granted to 63 people, and in the same way nearly 600 surgical appliances have been provided. With a few exceptions medicines were dispensed on the premises, nearly 20,000 prescriptions having been made up at an average cost of 4½*d* each As the whole of the English staff and some of the Belgian gave their services free the dispensary was enabled to exist upon a comparatively modest income The premises were kindly lent free of rent for some months, and then at a reduced rate, drugs were latterly one of the heaviest items of expenditure, costing £240 during 1916 The total expenses of the dispensary for the 27 months of its existence barely exceeded £1800 An important branch of the work was that of providing doctors to visit refugees who were too ill to come to the dispensary In the earlier months there was a certain number of Belgian doctors available in London who could do this work, and when they were not available English practitioners visited the Belgian patients in their own neighbourhoods but in view of the general shortage of doctors the provision of domiciliary treatment was always attended with difficulty

The Training of the Disabled Soldier

Several weeks ago it was stated that the Ministry of Labour was collaborating with the War Pensions Statutory Committee in setting up Trade Advisory Committees, on which both employers and employed were to be represented, to deal with the training and employment of disabled men in various trades In Lancashire, where a county authority is dealing with the same question the movement has, up to the present, taken the form of collecting information from all the education authorities in the county with regard to the facilities which they would be able to offer for training men in various industries This information has been tabulated and will shortly be circulated to all the Local Pensions Committees for their use It is hoped that the whole of the cost will be met by the Pensions Ministry and that no education authority will hesitate to accept men from any part of the county

Medical Men of Military Age in Ireland —The Council of the Irish Medical Association have passed the following resolutions —

1 The Council of the Irish Medical Association consider that it is unfair and dangerous from a public health point of view for the authorities to refuse sanctioning temporary appointments of medical men of military age in the country where the services of men over military age cannot be procured

2. The Council of the Irish Medical Association consider that the military authorities are not consistent in their action in refusing to employ medical men over 50 years of age for foreign service although active and energetic and in some cases well known operating surgeons while they have given military home work to many men who are of military age

German Treatment of British Prisoners of War A Scottish Resolution —The Faculties of Medicine of the Scottish Universities, together with the Presidents and Councils of the Royal College of Surgeons of Edinburgh and of the Royal Faculty of Physicians and Surgeons of Glasgow, have issued a resolution recording—

> Their condemnation and detestation of the neglect and inhumanity which characterised the conduct of certain members of the Prussian medical staff to whom the treatment of British prisoners of war was entrusted especially in the internment camps at Wittenberg and Gardelegen during outbreaks of typhus fever which had been largely provoked by overcrowding insufficient food and entire absence of all sanitary measures The facts as stated in the recent reports of a British Government Committee which are based mainly on the testimony of officers of the Royal Army Medical Corps, themselves prisoners of war are of such a nature as to bring indelible disgrace upon the medical men concerned and upon the German Government, which remains ultimately responsible for the treatment meted out to prisoners of war As members of a profession which has hitherto in every quarter of the civilised world been inaccessible to the shameful influences which make for barbarity in warfare we are reluctantly forced to the conclusion that a spirit of gross inhumanity has not been absent from the Prussian Medical Service

New Military Hospitals —A Red Cross hospital is to be established on the Millbay recreation ground at Plymouth The hospital will contain 200 beds, in tents, and some adjacent buildings have been lent and will be used as dining and recreation buildings The work is nearly completed, the cost of the equipment is estimated at £1750 which is being raised by subscription. The medical men on the staff of the institution are Mr F Down and Dr G S Earl —Bigadon House Buckfastleigh, Devon was formally opened for the reception of patients on April 2nd The institution contains 50 beds and patients will be sent there from the American Women s Hospital at Paignton —The Hon Mrs Smyth has given Ashton Court, near Bristol, as a military hospital. It will accommodate 120 beds —The Torrington Voluntary Aid Hospital was recently formally opened It contains 10 wards with 65 beds, and an additional 10 beds could be provided, should the necessity arise —Colonel James Craig, M P, has placed his residence, Craigavon, at the disposal of the military authorities as a home for neurasthenic soldiers It will be worked in connexion with the Ulster Volunteer Force Hospital

RED CROSS GIFTS —More than £200,000 have been collected in the United Provinces of India for the provision of transport for the wounded by the Special War Fund inaugurated last year by Sir James Meston, Lieutenant-Governor of the United Provinces —The Imperial Order of the Daughters of the Empire, Illinois have sent a gift of £2000 and New Zealand has sent through the High Commissioner a sum of £963

Medical News.

SOCIETY OF APOTHECARIES OF LONDON —At examinations held recently the following candidates were successful —

Surgery —E W Diggett (Sections I & II) Philadelphia and London Hospital D E Bearn (Section I) Durham T F Reason (Sections I & II) St Mary's Hospital F A Unwin (Section I) Westminster Hospital and L J Vincent (Sections I & II) Cambridge and St Mary's Hospital.

Medicine —G W Coombes (Sections I & II) London Hospital F A Unwin (Section II) Westminster Hospital and C G G Winter (Sections I & II) St Mary's Hospital

Forensic Medicine.—G W Coombes London Hospital and W H A Pratt Guy's Hospital.

Midwifery —C A W Chapman Sheffield.

The Diploma of the Society was granted to the following candidate entitling him to practise medicine surgery and midwifery C G G Winter

THE LATE JAMES HENTHORN TODD CONNOR, M R C S L S.A.—The death of Mr J H. T Connor took place at 1 Mulberry walk, Chelsea, on April 16th at the age of 75 years He was the fourth son of Dr William Connor of New Wandsworth whom he succeeded in practice, and a nephew of Professor Robert Bentley Todd F R S He was educated at King's College School and Hospital, where he was dresser to Sir William Fergusson For many years he had an extensive general practice in New Wandsworth and its neighbourhood holding various public appointments, including that of medical officer to the Battersea Training College He leaves a wife and four children His eldest son is Mr Bentley Connor, whose portrait of the King has commanded attention

MEDICAL MAGISTRATE —Mr Charles George MacVicker B.A M B., B Ch B A O R U I has been placed on the commission of the peace for the county of Somerset.

THE LATE SIR JOHN HOWARD —The name of Sir John Howard the engineer philanthropist who died on April 20th in his eighty seventh year is perpetuated in Brighton by two benefactions—the Howard Convalescent Home at Black Rock which he built and endowed at a cost of £50 000 for ladies of limited means but which on the outbreak of the war was handed over to the War Office for wounded soldiers and a scheme for the building and endowing at an outlay of £30 000 of 24 cottages as cottage homes for incapacitated nurses in memory of Nurse Cavell He had previously founded the Howard Charity, which provides regular weekly assistance to a large number of old people

DONATIONS AND BEQUESTS —By will the late Mrs Sarah Clayton Dawson Upper Norwood S E, left £1000 each to the Convalescent Home Enys road Eastbourne and the London Homoeopathic Hospital and [illegible] to the Medical Missionary School in connexion with the Hospital —The late Miss Isabel Marion Briscoe of Codsall Staffordshire has left £500 each to the Wolverhampton and Staffordshire General Hospital and the Wolverhampton and District Hospital for Women £100 each to the [illegible] Hospital and the Brompton Consumption Hospital and [illegible] to the Wolverhampton district branch of the Queen Victoria Nursing Association —By will the late Mr Thomas Wharrie, of Eton-avenue, Hampstead, N W, has left £1000 each to the Royal Infirmary, Glasgow, the Western Infirmary, Glasgow, the Victoria Infirmary, Glasgow, the East Park Home for Infirm Children and the Higginbotham Sick Poor Nursing Association —The late Mr Ernest Penrose Arnold of Stilemans Godalming, has by will made a large bequest to the Children's Sanatorium at Holt Norfolk, or other sanatorium for the poor to be selected by his executors

THE LATE CHARLES SINCLAIR THOMPSON, M B, C M EDIN —Dr C S Thompson, consulting surgeon to Bideford Infirmary died at his residence, Bideford, Devon on April 9th The deceased, who succeeded his father had practised in Bideford and the district for over 40 years retiring from active work a year ago He was on the honorary surgical staff of the Bideford Infirmary and held appointments under the Bideford union for 35 years Dr Thompson, who was greatly respected in Bideford, leaves a widow and one son, a lieutenant in the Royal Engineers

Dr James Bertie Simpson has been appointed a deputy lieutenant of Sutherland

CENTENARIANS —Miss Charlotte Carlyon, who was born on Feb 16th, 1815 died at Truro recently Her cousin, Rev P Carlyon, died a few years ago at Falmouth in his 103rd year —Mrs Eleanor Plaistowe died recently at Highgate aged 102 years

THE LATE DR H. P POTTER —Henry Percy Potter M D Durh, F R C S Eng L S.A., D.P H Cantab, who for 37 years was medical superintendent of the Kensington Infirmary died on April 9th at the age of 63 years He received his medical education at St Thomas's Hospital and in Paris qualifying L S.A. in 1875 Three years later he obtained the F R C S Eng by examination and in 1893 he graduated M D at Durham University He was also a D.P H of Cambridge After holding house appointments at St Thomas s Hospital he took up the resident appointment at the Kensington Infirmary which he held until his death At one time he was president of the West London Medico-Chirurgical Society Dr Potter made several contributions to medical literature, the more important being a treatise on Gonorrhoeal Rheumatism, its Nature and Treatment published in 1878, and an account of the natural history of the "Voyage of the *Sunbeam*"

Parliamentary Intelligence.

HOUSE OF COMMONS

THURSDAY, APRIL 19TH

Health of Salonika Forces

Answering Mr DILLON who asked what precautions were being taken to safeguard the health of the Army in the neighbourhood of Salonika during the summer months, Mr BONAR LAW said I can assure the House that the Government are fully alive to the difficulties and dangers in connexion with this matter, and are taking all possible steps

Deaths at Kinmel Park Camp

Mr HAYDN JONES asked the Under Secretary for War what was the number of deaths amongst soldiers at Kinmel Park Camp, Rhyl for the months of February and March and the causes of such deaths —Mr MACPHERSON replied The answer is as follows —

February 1 officer 15 men: Pneumonia 7 bronchitis 4 pleurisy 2, motor accident 1 died at Abergele of syncope 1 found dead in quarters (an officer) 1 March: 1 officer 17 men Pneumonia 6, cerebro spinal meningitis 4 bronchitis 1 pneumococcal meningitis 1 meningitis 1 dilated heart 1 hemiplegia 1 cancer of stomach 1 under anæsthetic 1 bomb wounds (an officer) 1

Artificial Limbs for Disabled Soldiers

Replying to Major CHAPPLE Mr BARNES (Minister of Pensions) wrote A committee of experts exists for the purpose of advising as to the most suitable types of limbs for disabled soldiers, and as to the prices that should be paid for them If it advises that the prices asked by the manufacturers are excessive the question of a Government factory will be considered but the main consideration which I have in view is not the cheapness of the limb but its efficiency

Tuberculosis Treatment in County Meath

Mr P WHITE asked the Chief Secretary for Ireland why the application of the Meath county council for £347 10 (it being the only money received from the Treasury for the treatment of tuberculosis) had not been granted this year as similar estimates were since the passing of the National Health Insurance Act 1911 and whether the granting of the amount was recommended by the Local Government Board for Ireland —Mr DUKE wrote in reply

The Treasury decided not to sanction this grant on the advice of the Local Government Board for Ireland, with which the Irish Insurance Commissioners agreed, that the arrangements for the treatment of tuberculosis in county Meath were not satisfactory

MONDAY, APRIL 23RD

Calling up Medical Men

Mr **BROOKES** asked the Under Secretary for War whether, in order to prevent difficulties arising by the withdrawal of medical service in any area, Insurance Committees or other authorities responsible for the public health would be allowed a right of appeal against the recent order calling up medical men similar to that accorded to individuals — Mr **MACPHERSON** replied Each individual affected by the Military Service Acts has the right of appeal, and a medical man can appeal to a tribunal, who will refer his case to the Central Medical War Committee The procedure as to the action which an Insurance Committee or other authority may take is being discussed by the departments concerned

Venereal Disease Bill

Mr **HAYES FISHER** (Parliamentary Secretary to the Local Government Board) moved the second reading of the Venereal Disease Bill, the object of which is to prevent the treatment of venereal disease otherwise than by duly qualified medical practitioners and to control the supply of remedies therefor The Bill has already passed through the House of Lords[1] He said that the Bill was not a war measure It, however, had this connexion with the war, that as the Royal Commission on Venereal Diseases reported, and as experience showed, after war outbreaks of venereal disease were likely to occur to men in districts which had been comparatively free from it Although this Bill had been introduced he did not wish the House or the country to jump to the conclusion that there was any increase in this formidable disease Except in regard to the Army, the Navy, and the police, there were no statistics available to show the extent of the disease, but if the deaths due to syphilis were taken the evidence would lead to the conclusion that the disease was stationary, or at all events it was not increasing So far as the figures could be obtained, there was nothing to show that the ratio per 1000 in the Army had in any degree increased But it was not necessary to try to prove any increase in the prevalence of venereal disease in order to prove the case for the Bill Its prevalence was quite formidable enough In 1916 there were 36,500 cases treated in the London Lock Hospital alone, and these had increased from 23,074 cases in 1913 As a result of the report of the Royal Commission, Mr Long, when he was President of the Local Government Board, had circularised local authorities asking them to establish centres for the scientific diagnosis of the disease and for free and complete treatment Ninety nine out of the 145 local authorities who had been thus circularised had submitted schemes, and 61 of those schemes applying to a population of 19 millions had been approved

Mr **KING** How many of the schemes are in actual operation?

Mr **HAYES FISHER** Most of them are in operation Take the case of London He had only the figures relating to six hospitals for the first three months of this year, and in them 1195 males and 350 females had been treated as new patients It was remarkable in these times, when there was such pressure on hospitals and on the medical profession, that they had been able to submit practical schemes He had great hopes that these schemes would rapidly mature and that the results from them would be, perhaps not all that could be possibly expected, but would be very substantial in gradually diminishing the prevalence of these diseases The policy which was being adopted could be described as the maximum of persuasion with the minimum of penalty

Need for Legislation

Why, then, was legislation required? It was necessary as a complement to administrative action, and it would hasten the operation of that action A policy was wanted to persuade the victims of these diseases to abandon quack methods of treatment and go to the centres where they would get sound and scientific methods of treatment It was desirable to prevent the treatment of these diseases by methods which were specious, fallacious, and, indeed, pernicious The Bill prevented the treatment of the disease otherwise than by a duly qualified medical practitioner, or the dispensing of any remedy except on the prescription of a medical man Persons suffering from venereal diseases were a menace to the health of the community Although the Bill rested on persuasion of the sufferers to seek proper treatment that policy was retarded and hindered if they did not prevent quacks from carrying on their trade The liberty of the individual had constantly to give way to the safety of the State All statutes for the compulsory notification of infectious diseases interfered with the liberty of the individual, and this infringement of the liberties of the subject in this case was proposed to preserve the greater liberty of the community The Royal Commission had no hesitation in stating that the effects of the unqualified practice as regarded venereal disease were disastrous He was quite conscious of the limitations of the Bill, but in this campaign against venereal disease all forces—educational, moral, and spiritual—had to be brought to bear In passing the Bill Parliament would be providing the country with legislation which was ancillary to the policy of persuasion

Criticism of the Bill

Mr **KING** thought that the Bill should have been postponed until centres for free treatment were in operation in every part of the country He deprecated any step which would confer a monopoly on salvarsan treatment at this stage

Captain **GUEST**, whilst he supported the second reading considered that the Bill did not go far enough to cope with the magnitude of the evil caused by venereal diseases He went on to deal with the seriousness of these diseases in the Army The Under Secretary for War had stated recently that the ratio was 43 per 1000 But in the aggregate that meant a very large total Since the war began there had been admitted to hospitals in England over 70,000 cases of gonorrhœa, over 21 000 cases of syphilis, and over 6000 cases of soft chancre All these men might with few exceptions be regarded as unfit for further military use. He thought that it would be no exaggeration to say that during the course of the war between 40 000 and 50 000 cases of syphilis and between 150,000 and 200 000 cases of gonorrhœa had passed through the hospitals in France This showed how great was the magnitude of the evil and how ineffective were the proposals of the Bill for dealing with it In his view two measures were necessary—the removal of temptation to the soldier and the subjection of civilians to compulsory detention and cure

Sir **WILLIAM COLLINS** said that he could not help thinking that the legislative efforts of the Government had not been so fortunate as their administrative efforts He was not quite sure—although he entirely agreed that the practice of the quack in cases of venereal disease was most pernicious and objectionable and from every medical and surgical point of view to be condemned—that he desired adventitious protection for the profession against the kind of practice which ought to carry its own condemnation There was also the case of the tuberculosis quack and the cancer quack He was not at all sure that the tuberculosis quack was not more shameful than the quack with whom they were now concerned, and that the cancer quack was not worse than either If Parliament was going to put down unqualified practice at all, it would be better to put it down altogether rather than deal with this particular corner of it alone At the same time he wished to recognise that the practice of medicine, though a science, was not an exact science, but a progressive science, and a science which should look for new life from any quarter from which it might proceed The profession suffered rather than gained by association with the policeman and the gaoler in enforcing this prohibition, and he would rather see it rest on its own merits

Mr **GLYN-JONES** said that if the provisions of the Apothecaries Act were enforced against unqualified people who were to-day dealing with venereal disease nine-tenths of the evils which the present Bill was intended to hit would be removed These provisions were not enforced The Bill conferred on medical practitioners privileges which were not already possessed by them The Bill was confined to venereal diseases, and it provided that the treatment should for the first time by law be limited to the medical profession whilst allowing doctors, when treating other than insured persons to buy and sell for profit to their patients any drugs or appliances which they might require The pharmacists were not claiming too much when they said that if members of the medical profession were given the sole right to prescribe for patients who could not get treatment anywhere else the patients were driven to them, and the sole right carried with it the ability to usurp the functions of another profession and to make a profit out of buying and selling the remedies which were supplied to those patients

Mr **DILLON** considered that the Bill and the Criminal Law Amendment Bill were rather bad specimens of panic legislation In his opinion the way to deal with the subject would have been to go at it first from the moral and economic side, and also to have set up a Ministry of Health, the necessity for which, he rejoiced to observe, had at last dawned upon the people of this country

Sir H **GREENWOOD** spoke of the number of Canadian troops who had gone through hospital for venereal disease He hoped that steps would be taken to deal with such a situation, and that the Bill would go rapidly through the House of Commons It was an earnest effort to deal with a disease which was largely due to lax administration in the past

After some further consideration the Bill was read a second time

---

[1] THE LANCET 1917 i 431

TUESDAY, APRIL 24TH.

Public Health Administration in Scotland

Mr MACCALLUM SCOTT asked the Secretary for Scotland whether the recent utterances of the President of the English Local Government Board with regard to the establishment of a Ministry of Health had any application to Scotland, whether he had had under consideration any proposals which would involve the local administration of public health in Scotland from the town and county councils which were at present charged with it and whether, before any such proposals were adopted he would afford ample opportunity for their discussion in the bodies affected —Mr MUNRO replied Although my noble friend's speeches have not referred to Scotland any proposals affecting the machinery of government in relation to public health and its administration, of course, interest Scotland as well as England I have received various suggestions in the matter which will receive my consideration It is clear that any proposals implying such a change as my honourable friend describes could only receive effect by means of legislation which would afford ample opportunity of discussion

Cocaine in Dentistry

Mr RAFFAN asked the Under Secretary for the Home Department whether it was proposed to extend the permit to unregistered practitioners in dentistry to use preparations containing not more than 1 per cent of cocaine for a further period upon its expiry on April 30th and, if so, to what date such extension would apply —Mr BRACE answered The existing exemption will be extended for a further period of three months, and an Order will be made accordingly

WEDNESDAY, APRIL 25TH

Public Health Legislation in Ireland

Mr ARTHUR SAMUELS asked the Chief Secretary for Ireland (1) whether, with a view to the better and more economical enforcement of regulations by the Local Government Board in regard to epidemic and infectious diseases in Ireland he would introduce a Bill extending the provisions of the Public Health (Prevention and Treatment of Disease) Act 1913 to Ireland and (2) whether having regard to the representations of the medical profession in Ireland and the desirability of securing skilled treatment in cases of child birth by properly qualified midwives, he would introduce a Bill for Ireland at an early date framed upon the lines of the English Midwives Act of 1902 and the Scotch Midwives Act of 1915 —Mr DUKE answered Bills have been drafted for the purposes mentioned in both these questions

Calling up Medical Men

Mr PRINGLE asked the Chancellor of the Exchequer whether notices had been issued to all medical men of military age to report themselves for service at 9 A.M on April 26th, whether the doctors so called up were to be required immediately to accept commissions and to be ready to join for service at 48 hours' notice on or after May 6th, whether in the case of doctors who refused to apply for commissions the recruiting officers were instructed to enlist them as privates in the R A.M C, whether in view of these instructions steps were being taken for securing that the essential needs of the civil community were met in order that a serious breakdown in the medical service might be averted —Mr BONAR LAW replied The calling up of these doctors is necessitated by the attacks on hospital ships, but the danger of the civil population being left without doctors is fully realised, and though all doctors of military age have been formally called up they will only be taken after consultation which is now taking place between the Local Government Board and the National Health Commissioners.

Mr PRINGLE Will the right honourable gentleman give an assurance that where a man is willing to accept a commission, even if he accepts it he will not be taken away without consultation with those authorities?—Mr BONAR LAW That is the substance of the answer I have given The whole subject is being considered from all these points of view

Sir W ESSEX Will the right honourable gentleman consider the subject of replacing these medical men by others who will be presently liberated from employment owing to the probable closing up of military hospitals in this country in consequence of the transference of patients?—Mr BONAR LAW The National Health Insurance Commissioners and the Local Government Board are fully alive to that, and realise that the problems can only be satisfactorily met if men over military age will undertake part of the duties

Commander WEDGWOOD Will the right honourable gentleman see that the Ministry of Munitions is also consulted on the question seeing that doctors are very important in connexion with the manufacture of gas and in connexion with steel works?—Mr BONAR LAW I can assure the House that the whole subject is being thoroughly gone into from the point of view of making the best use of the material available In the view of the Government and I am sure that it is the view of the House also the wounded must have the first claim

Vacancies.

For further information regarding each vacancy reference should be made to the advertisement (see Index)

When the application of a Belgian medical man would be considered the advertisers are requested to communicate with the Editor

BOURNEMOUTH, ROYAL VICTORIA AND WEST HANTS HOSPITAL, Boscombe Branch.—House Surgeon. Salary £125 per annum and extras with board &c.

BRISTOL ROYAL INFIRMARY —House Physician and House Surgeon Salary at rate of £120 per annum with board &c.

BURY INFIRMARY —Junior House Surgeon. Salary £150 per annum, with board &c

BURY AND DISTRICT JOINT HOSPITAL BOARD —Assistant to Medical Superintendent. Salary £250 per annum with board &c.

CAMBERWELL INFIRMARY Brunswick-square.—Two Locum Tenens Assistant Medical Officers. Salary £7 7s weekly each with board, &c.

CHESTER ROYAL INFIRMARY —Assistant House Surgeon Salary £150 per annum with board &c

DERBY DERBYSHIRE ROYAL INFIRMARY —Two House Surgeons Salary £200 per annum with board &c

GREENWICH UNION INFIRMARY AND WORKHOUSE.—Assistant Medical Officer unmarried. Salary £200 per annum, with apartments rations &c.

HARROGATE INFIRMARY —Resident House Surgeon

KENT COUNTY COUNCIL.—Tuberculosis Officer Salary at rate of £500 per annum

LEEDS PUBLIC DISPENSARY —Second Female Resident Medical Officer Salary £200 per annum, with board &c.

LEICESTER ROYAL INFIRMARY —Two Resident Surgical Officers. Salary £250 per annum with apartments &c.

LONDON TEMPERANCE HOSPITAL, Hampstead road N W —Temporary Anæsthetist two days a week for about two or three hours Salary 25 guineas per annum

MANCHESTER, ANCOATS HOSPITAL.—House Physician. Salary £200 per annum with board &c

MANCHESTER, BAGULEY SANATORIUM FOR TUBERCULOSIS.—First Assistant Medical Officer unmarried. Salary £350 per annum with board, &c.

MANCHESTER CITY OF —Temporary Assistant Tuberculosis Officer Salary £400 per annum

NOTTINGHAM CHILDREN'S HOSPITAL.—Female House Surgeon. Salary at rate of £200 per annum with board &c.

NOTTINGHAM CITY ASYLUM —Locum Tenens. Salary £7 7s per week with board &c.

NOTTINGHAM GENERAL HOSPITAL.—Two Assistant House Surgeons for six months Salary at rate of £250 per annum each board &c.

NOTTS COUNTY COUNCIL.—Second Assistant Tuberculosis Officer Salary £400 per annum.

PRESTON ROYAL INFIRMARY —Resident Medical and Surgical Officer Salary £120 per annum with board &c.

QUEEN'S HOSPITAL FOR CHILDREN Hackney road Bethnal Green.—Temporary Anæsthetist Salary £50 per annum.

RHONDDA URBAN DISTRICT COUNCIL.—Dental Surgeon Salary £300 per annum

ROCHESTER, ST BARTHOLOMEW'S HOSPITAL, Kent.—Senior Resident House Surgeon. Salary at rate of £300 per annum, with board &c.

ROTHERHAM HOSPITAL.—Junior House Surgeon Salary £150 per annum, with board, &c.

SHEFFIELD ROYAL INFIRMARY —House Physician. Salary £120 per annum with board &c.

SOUTH LONDON HOSPITAL FOR WOMEN South Side, Clapham Common S W —Female Anæsthetist on Tuesday afternoons. Salary 10s 6d per attendance.

WESTERN GENERAL DISPENSARY Marylebone-road N W —Honorary Ophthalmic Surgeon

WEST RIDING OF YORKSHIRE.—Two Temporary School Medical Inspectors. Salary £520 per annum.

Births, Marriages, and Deaths.

BIRTHS

LEWIS SMITH.—On April 18th, at Bank House, Pembroke Dock, the wife of Surgeon F Lewis Smith, R.N of a daughter

REYNOLDS —On April 4th, at Shameen, Canton, China, the wife of Dr W Graham Reynolds, of a son

WALTON —On April 23rd at Devonshire-street, W the wife of A. J Walton F.R.C S., of a son (still born)

MARRIAGES

CLEMENTS—JONES.—On April 17th at St. Hilary's Church, Wallasey Captain William Leitrim Clements, R.A.M.C., to Dorothy Melangell, only daughter of the late Rev Owen Jones Rector of Nantglyn Denbigh and niece of Mrs. W R. Roberts of Rolleston-drive Wallasey

CRAWFORD—JACKSON —On April 17th at Clones Parish Church Vincent James Crawford, D S O Lieutenant-Colonel R A M.C to Ellen Kathleen (Eileen) eldest daughter of the late Samuel K Jackson and Mrs. Jackson Cara, Clones, co. Monaghan.

DEATHS

MARTIN —Killed in action on April 9th Captain T W Martin R.A.M.C M O attached Royal Scots.

SADLER.—Killed in action on April 17th, Captain Vyvyan Kendall Sadler R.A.M.C aged 33

SCUDAMORE.—On April 17th after a short illness Lieutenant L. G Scudamore R.A.M.C

WEAVER.—Killed (the result of a riding accident) at Curragh Camp Ireland on April 20th while serving as Captain R.A.M.C John James Weaver M.R.C.S Eng., L.S.A., D P.H. Camb Medical Officer of Health for County Borough of Southport, elder son of the late James Weaver M D., of Southport, aged 56

N B.—*A fee of 5s is charged for the insertion of Notices of Births, Marriages and Deaths*

Notes, Short Comments, and Answers to Correspondents.

SALT IN THE DIET

Mr William Mugfur, of Colan, Cornwall, who is in his 100th year, and who is probably the oldest active farmer in England, recently informed a correspondent of the *Daily Express* that, in his belief, to eat plenty of salt was a good thing if one wanted to live to a good old age The use of salt in the diet has always been more or less a controversial matter In 1748 a scientific experimenter, Dr William Brownrigg, of Cumberland, published a valuable book on the Art of Making Common Salt In 1822 the author of the Art of Invigorating and Prolonging Life,' who disguised himself as The Author of 'The Cook's Oracle,'" but who is known to have been Dr William Kitchiner, famous for his dinner parties, stated in his quaint little book that—

> Salt is *aliorum condimentorum condimentum* and the most salubrious and easily obtainable relish which Nature has given us to give sapidity to other substances and has this advantage over all other Sauces that if taken to excess—it carries its remedy with it in its aperient quality He adds: We suspect that most mischief is done by the immoderate and constant use of the Common Condiments We have seen some puritanical folks who are for ever boasting that they never touch Made Dishes &c (one would suppose they had the Tongue of Pityllus) so be-devil every morsel they put into their Mouth—with Pepper and Mustard &c that they made their common food ten times more piquante—than the burn gullet Bonne Bouche of an eastern Nabob or a Broiled Devil enveloped in veritable Sauce d Enfer

Dr Kitchiner includes the following footnote explaining the allusion to the Tongue of Pityllus —

> This gentleman had so cold a Stomach (saith Suidas) that he made a sheath for his Tongue that he might swallow down his Pottage scalding hot, yea I myself have known a Shropshire Gentleman of the like quality " (This footnote seems to have been extracted from Dr Muffett on Food, 4to 1655 p 237)

In 1699 England imposed a duty on salt which was revived on the motion of Sir Robert Walpole in February, 1732, increased to 15*s* a bushel in 1805, reduced to 2*s* in 1823, and abolished in 1825 Salt for the fisheries was free of duty In the "eighties" there arose again a good deal of controversy in this country as to the injuriousness of eating common salt and a book on the History of Salt was published in 1881 by Mr E M Boddy, F R C S, to uphold the eating of salt, but some of his arguments in its favour were thought by reviewers to be too enthusiastic However, in 1883 THE LANCET referred editorially to the popular statements as to the injuriousness of common salt and commended its judicious use Books condemning the use of salt have also been published by industrious compilers of public opinion on the subject Salt and saltless diets have been both recommended with some amount of strenuousness, but Dr Kitchiner's quotation from Colman may be referred to here —

> ' Man differs more from Man
> Than Man from Beast.

In THE LANCET of 1907, under the title of "Chloride of Sodium in Heart Disease, we quoted the opinion of an author who asserted that the average individual consumed far too much salt, and we then said that—

> ' Many people imagine that salt is a prophylactic against ill health and that they cannot well consume too much of it With delicate people however, the habitual ingestion of more salt than is required by the system is sure to produce ill effects The amount of salt that can be consumed daily with safety depends upon the constitution of the individual "

Years ago medicinal treatment was tried by many medical men of administering sodium chloride in cholera, phthisis, typhoid and other fevers, and in parasitical diseases The most favourable results seem to have been obtained in the treatment of fevers by administering graduated doses In more recent times common salt is claimed to be beneficial in leprosy, but deleterious in epilepsy and in diseases of the kidney In 1902 THE LANCET commented on the question whether 80 grains of salt per gallon in potable waters and for domestic supply purposes was objectionable On the whole the idea that salt prolongs life is a fallacy, but the opposite view is sure to be held by not a few who studiously avoid it as an addition to diet

THE DRINK QUESTION

IN common with other countries England has been compelled to safeguard the efficiency of its army by the drastic regulation of the sale of intoxicants The two burning questions of the moment, State purchase and the nationalisation of the liquor traffic, are discussed in *The Alliance Year Book and Temperance Reformers' Handbook for 1917* (edited by G B Wilson, B A Lond, Howard Medalist, Royal Statistical Society, published in London and Manchester by the United Kingdom Alliance, price 1*s* net) by the Rev Principal Denney, D D, and Mr Edward Wood, J P, respectively The editor contributes an article on Alcoholic Liquors and Foodstuffs, while short notes deal with the food supply of the United Kingdom, prohibition, and the liquor trade finance Figures and diagrams supplement a formidable array of facts

A KIDNEY AND ABDOMINAL PROTECTOR

Dr John Campbell, of Belfast, has called our attention to a garment to protect the lower part of the trunk designed by Lady Angela Adair, of Dunsdry, Co Antrim, and consisting of a shaped band of flannel about 36 inches long and 12 inches wide at the waist, with a narrower band passing between the thighs, which can be readily adjusted The designer believes that the protector will prove useful in preventing exposure to cold, and that it will add to the comfort and health of those who wear it The makers are *Messrs Robert McBride and Co, of 20, Alfred street, Belfast*

ECONOMY IN RUBBER GLOVES

Messrs W & A. Bates, Limited, of St Mary's Mills, Leicester have written with reference to the letters which have appeared on this subject, and have sent us some actual figures of the saving effected by some of the hospitals which send their damaged gloves to be repaired by the electric vulcaniser

—	Gloves repaired during 12 months	Cost of repairs.
		£ s d
London Hospital Whitechapel road ..	1281	18 7 3
1st Eastern General Hospital, Cambridge	1741	28 4 0
War Hospital Croydon ..	864	15 3 2
District Infirmary Ashton under Lyne	563	10 2 6
3rd London General Hospital, R A M C, Wandsworth ...	593	9 0 10
Queen's Hospital Birmingham	950	17 8 6

Total gloves repaired during 12 months	Total cost of repairs	Cost of same number of new gloves at an average price of 2*s* per pair	"Apparent" or maximum saving effected.
6042	£98 6*s* 3*d*	£302 2*s* 0*d*	£203 15*s* 9*d*

Hospitals which send all their damaged and worn-out gloves to this firm for repair receive scrap prices for any gloves which are considered to be past repair

"MONKEY" NUTS AS A FOOD

To the Editor of THE LANCET

SIR,—There seems to be now an increased sale of "monkey" nuts, and I observe that the price, which in peace time was 1*d* a pint, has now reached 3*d* a pint in some places I bought a pint of these nuts and found that in the shells they weighed 5 oz and the yield weighed 3¼ oz At 3*d* a pint this equals 1*s* 3*d* per pound for the "nuts," and at 2*d* a pint equals 10*d* a pound In some places they are sold at 6*d* a pound shelled I ground up the seeds, of which there are one, two, or three in the shell, in a mincer, and mixed the minced nuts with an equal quantity of flour and a little sugar and baked as a flat cake I have come to the conclusion that 1 part of nuts to 3 parts of flour would have been better, as the cake was too oily and rich and produced in three people a slight feeling of nausea and a desire to drink half a pint of water immediately I have also eaten the peanuts unbaked and experienced the same urgent desire to drink I remember seeing installed on the counter in London licensed victuallers' establishments a few years ago what were, I believe, American machines like urns for supplying by a penny in the slot arrangement a small quantity of these "nuts" shelled There seems to have been method in this attention paid to customers In grinding up the nuts a moderate quantity of clear thin oil is obtained, something like olive oil I learn that this arachis oil is used in the East instead of olive oil in cooking and for making ointments, liniments, and plasters, and as a substitute for cod liver oil The name *Arachis hypogæa*, which is interpreted as "without a backbone" and "under the earth," refers to the strange power of the plant of forcing the fruit or pods as they increase in size into the earth, where they ripen their seeds, thus accounting for the English names of pea-nut" ground nut" and 'earth nut," and sometimes "underground kidney bean The shells, when ground up in a small mill or mincer, make a very light-weight dry bran like substance, which answers well for stuffing cushions instead of bran I have seen public places strewn with monkey nut shells, but they could be made use of in this

When immersed in boiling water some of the ground shell sinks and some floats, but it does not dissolve

I am, Sir, yours faithfully,
OBSERVER

London April 16th 1917

* Another South American name for the "monkey" nut is Cacahuate, which evidently accounts for the common French names of "Cacahuète and "Cacahuate,' although other French names are Arachide" and "Pistache de terre" The German names are Erdnuss," and for the oil Katjangöl, evidently a corruption of the East Indian Katchung oil It is also claimed that from these oily nuts a kind of inferior chocolate may be made, the oil, however, is said not to keep" well, but soon to become rancid

In a recent handbook on Brazil by J C Oakenfull is the following paragraph —

> Pea nuts (*Amendoim*) These kernels yield 50 per cent of oil and the shells contain 85 48 per cent. of cellulose The residue of the crushed nuts forms an excellent feeding cake for cattle containing more than 31 per cent of albuminoids 11 per cent. of oil, and 31 per cent. of starch and saccharine matter The plant thrives only in a limestone district or in soils where an abundance of calcareous matter has been added It should be planted in rotation with tubers or maize. In favourable circumstances 2½ tons of nuts to the acre is not an out-of the-way crop

—ED L

' MEDICAL PRACTITIONERS AND IMPERFECT OPERATIONS "

UNDER the above heading the *Western Morning News* has quoted recently the report of Mr J F Fry, in reference to tonsils and adenoids in the Exeter division, presented by him to the Devon Education Committee —

> I am convinced that the school medical inspector should, with regard to all defects only send notices to parents in those cases where the deficit is so very marked that the medical attendant cannot do otherwise than endorse the verdict. There is an undoubted disinclination on the part of many practitioners to fall foul of the school medical inspector if possible In four or five instances parents complained that my promise was not fulfilled as their children had not benefited by the operation, and the result was that all other cases refused treatment in those places. Examination showed that the local practitioner in one case had taken a small slice of the tonsil in another had removed one tonsil only and had not touched the adenoids The moral is, that while some general practitioners remove tonsils and adenoids as well as a specialist, it would be wiser that all cases should be treated by a skilled operator and I think that all ought to go to hospital

---

I M S (P & O S N Co) is thanked for his communication but has omitted to enclose his card

Medical Diary for the ensuing Week.

SOCIETIES

ROYAL SOCIETY OF MEDICINE, 1, Wimpole-street, W

MEETINGS OF SECTIONS

Thursday, May 3rd.

OBSTETRICS AND GYNÆCOLOGY (Hon. Secretaries—H Russell Andrews T G Stevens): at 8 P.M

Annual General Meeting—Election of Officers and Council for Session 1917-1918

Specimens

Mr Gordon Ley: Spontaneous Rupture of Uterus

Mr T G Stevens: Decidual Reaction in a Polypus

Short Communication

Mr Gordon Ley: Decidual Reaction in a Uterine Fibroid.

Papers

Mr J D Malcolm: Post-operative Tympanites: its Nature and Some Points in its Treatment.

Dr Cuthbert Lockyer: Ovarian Pregnancy

Friday May 4th.

LARYNGOLOGY (Hon. Secretaries—Cecil I Graham Frank A Rose) at 4 P.M

Annual General Meeting—Election of Officers and Council for Session 1917-1918

Cases and Specimens

Mr Mark Hovell: (1) The Treatment of Irritative Coughing (2) Retainers of Tracheotomy Tubes

Mr L D D Davis: Two Cases of Optic Neuritis caused by Nasal Disease

Mr G W Dawson: (1) Naso pharyngeal Fibroma (2) Adherent Palate: (3) Congenital Atresia Naris

Dr Watson Williams: Recent Methods of Nasal Diagnosis illustrated

Mr W M Mollison: (1) Osteomyelitis of Frontal Bone (2) Carcinoma Maxillæ after Operation

Dr Donelan: Specimen of Epithelioma removed from the Vocal Cord

Mr Tilley: Skiagram of Pituitary Fossa and Notes upon Removal of New Growth

Dr Dan McKenzie: Spasmodic Stricture of Thoracic Œsophagus Skiagrams

---

RÖNTGEN SOCIETY at the Cancer Hospital (Free) Fulham road S W

TUESDAY —8.15 P M General Meeting Adjourned Discussion on the Future of the British X Ray Industry (continued by Capt T Holland (President)) Mr A S Esslemont Dr J Metcalfe Mr P J Neate Mr F W Higgins Mr W R Bullmore Mr A L Dean Mr B H Murphy Mr W E Schall Mr J H Webb, Mr H C Head and Dr R Knox will take part in the discussion.

ROYAL SOCIETY OF ARTS John-street, Adelphi W C

WEDNESDAY —4 30 P M., Paper :—Mr J C Shenstone: Herb-Growing in the British Empire: its Past, Present, and Future

WEST LONDON MEDICO-CHIRURGICAL SOCIETY, West London Hospital, Hammersmith road, W

FRIDAY —8 30 P M Meeting

LECTURES, ADDRESSES, DEMONSTRATIONS, &c.

EDITORIAL NOTICES

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff It is urgently necessary that attention should be given to this notice

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, *and when accompanied by blocks it is requested that the name of the author, and if possible of the article, should be written on the blocks to facilitate identification*

We cannot undertake to return MSS not used.

Offices 423, STRAND, LONDON, W C 2

MANAGER'S NOTICES.

ALTERATION IN THE PRICE OF "THE LANCET."

Increased war expenses and cost of production necessitate an increase of the price of The Lancet Commencing with the new year, the price was raised to *8d* The rates of subscription remain as revised in October

TO SUBSCRIBERS.

Will Subscribers please note that only those subscriptions which are sent direct to the Proprietors of The Lancet at their Offices, 423 Strand, London, W C 2, are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the *Proprietors* any connexion whatever) do not reach The Lancet Offices, and consequently inquiries concerning missing copies, &c, should be sent to the Agent to whom the subscription is paid, and *not* to The Lancet Offices

Subscribers, by sending their subscriptions direct to The Lancet Offices, will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect

The Colonial and Foreign Edition is published in time to catch the weekly Friday mails to all parts of the world

TO COLONIAL AND FOREIGN SUBSCRIBERS

Subscribers abroad are particularly requested to note the rates of subscriptions given on page 6

The Manager will be pleased to forward copies direct from the Offices to places abroad at the rates shown, whatever be the weight of any of the copies so supplied.

THE
Milroy Lectures
ON
MEAT INSPECTION,
WITH SPECIAL REFERENCE TO THE DEVELOPMENTS OF RECENT YEARS

Delivered before the Royal College of Physicians of London

BY WILLIAM J HOWARTH, M D MANCH., D P H.,
MEDICAL OFFICER OF HEALTH, CITY OF LONDON

LECTURE II[1]

THE COURSES OF INFECTION IN CATTLE.

MR. PRESIDENT AND GENTLEMEN,—The terms "localised" and "generalised" are used in meat inspection in connexion with the distribution of tuberculous lesions They are, however, not entirely satisfactory, for if they are strictly interpreted they are not of sufficient significance and, on the other hand, if they are given an extended meaning confusion may result. I prefer to use the words primary and secondary lesions and assume that primary lesions are always found in situations which admit of infection having been received from outside the body—e g , the lungs, mesenteric and cervical glands, the external genital organs and local inoculations The secondary lesions are extensions from the primary lesions from which latter the infection is conveyed by way of (*a*) the various tracts of the body, such as the respiratory or digestive tract , (*b*) the lymphatic system , (*c*) the venous blood stream , and (*d*) the arterial blood stream. In arriving at a decision as to the action which should be taken in any particular case I endeavour to locate the primary lesion and to decide along which course the infection causing the secondary lesions has passed It is not always possible to arrive at a definite decision, but in cases of doubt the more serious of the alternatives is the one accepted

In the bovine, the seat of the primary lesion varies with the age of the animal In calves of four or five weeks old tuberculosis is not common, but it is by no means infrequent and such cases as I have seen have been mostly of the congenital type In these cases the primary lesion is to be sought in the maternal system and the secondary lesions are distributed to the calf by the maternal arterial blood The cases which are not congenital among these very young animals are of the ingestion type, in which early lesions are found in the mesenteric glands and less frequently in the cervical glands or both. These cases also are not numerous At a little older age but with very few instances under ten weeks the regular type of cattle primary pulmonary is met with whilst at a still older age the primary ingestion cases diminish in numbers and the pulmonary type is almost the only one observed.

The course of infection can be followed with certainty by observing the lesions in very young animals These with few exceptions are not killed on account of illness but in the course of preparation for human food and thus early unsuspected cases come under observation

CONGENITAL TUBERCULOSIS

In the fœtal circulation the arterial blood passes mainly through the abdominal organs Very little reaches the lungs, and that only at a later stage in the circulation The obvious deduction is that in such circumstances blood charged with infection will mainly affect the liver spleen, and kidney and the lungs little if at all No primary lesion is observed and all lesions are of the miliary type In addition, the size of the lesions varies in groups indicating different stages of growth due to release of infection at different times As regards extent of infection the mesenteric glands show no deposits the greatest number of centres are in the liver the kidneys show the fewest and the spleen a number intermediate between the two The kidneys sometimes escape so far as may be judged by careful macroscopic search When slaughtered at the age of four weeks the largest lesions may be about a quarter of an inch or even more in diameter in the liver and spleen, but rather less in the kidney There are often many minute spots observed in the liver which appear to suggest a very recent dissemination. These minute spots are not so easily seen on the spleen owing to the nature of the covering , they are seen in fewer numbers occasionally on the surface of the kidney This later dissemination may have passed through the lungs into the arterial stream, as the lungs often show early centres of infection of the miliary type These latter are small, many are subpleural, and in that situation are about an eighth of an inch in diameter, translucent, and obviously tubercles much younger in age than the earlier ones in the abdominal organs Their origin appears to be due to lymph infection conveyed from the abdominal organs and the related lymphatic glands after birth They reach the lung either by direct entrance into an eroded vein in the affected organ or lymph gland, or by infected lymph which reaches the blood stream by way of the main lymph tract From the lungs the infection is carried in the arterial blood to the system generally If the dose of infection has been severe, lesions will be found in the lymph glands of the carcass, most often the external inguinal and prescapular

This represents the course of events in the congenital cases If the calf is not slaughtered till a later age, all the lesions develop and auto infection may set up lesions in the mesenteric and perhaps cervical glands, and so a stage arrives when it becomes impossible to differentiate the case with certainty from one of primary intestinal origin with later dissemination. (This would not really matter to the meat inspector as regards his decision, since the distribution would be sufficient to require condemnation)

ACQUIRED TUBERCULOSIS

In calves up to the age of 10 weeks the abdominal type, although not common, is more frequently observed than the pulmonary This observation does not agree with the experience of Chaussé The primary lesion is more generally found in the mesenteric glands than the cervical Sometimes a double infection is noted

Abdominal Type

The mesenteric glands may be affected alone, but the liver soon shows miliary lesions and the portal gland becomes affected The infection is conveyed to the liver by radicles of the portal vein. Further development results in miliary deposits in the lungs conveyed by the venous blood stream in the manner already described The next advance is infection of the arterial stream by way of the lungs, resulting in secondary deposits in liver, kidneys, and systemic lymph glands and perhaps spleen All or only some of these may show lesions

Cervical Type

The cervical glands may show infection alone Later, miliary tubercles may be found in the lungs due again to venous blood infection Subsequent development follows infection of the arterial blood stream with results as in the last example

Double Primary Infection of Cervical and Mesenteric Glands

In this instance the only difficulty is the decision whether the liver lesions are due in part to secondary infection by way of the arterial blood, or whether they entirely arise from infection conveyed by the portal system. If from the arterial system lesions indicating at least two different ages may be observed, and the fact is rendered decisive if lesions are in addition found in the kidney, systemic lymphatic glands, or spleen.

Pulmonary Primary Lesions

This is by far the most common form of invasion of cattle by tuberculosis The development of the disease is easily followed. The lungs may show a primary lesion without macroscopic evidence of tubercle in any other organs, but extension soon occurs and the following possibilities are to be noted 1. Extension of the disease by the lymphatic tract to the glands in the mediastinum 2 Auto-infection by swallowing infected sputum which may give rise to lesions in the mesenteric glands or in one or other of the cervical glands 3 Infection of the arterial blood stream by way of the pulmonary artery and the left side of the heart 4 Extension of the primary lesion by the development of tubercles around the periphery of the primary lesion There may be more than one primary lesion observed in the lungs A few observations are desirable respecting these groups

---

[1] Lecture I was published in THE LANCET of Aug. 4th, 1917, p. 147

1. *Development by the lymphatic system*,—One or more of the mediastinal and bronchial glands soon become infected from the lungs, and they at a later stage may infect the venous blood stream in the manner already stated In this manner the lungs become infected secondarily with miliary tubercles in addition to their being the seat of the primary lesion

The bronchial and mediastinal glands appear to have a direct relationship with the pleural cavity Possibly this space is lubricated with lymph supplied by these glands and they may likewise drain off excess If that be the case it would account for the frequency of tuberculosis of the pleura which is often seen in considerable amount in relatively early cases of tuberculosis The remarkable extent of infection in the pleura is probably the result of friction since the lubricating medium in an infected state is passed backwards and forwards over the pleural surface It is interesting to note that pleural tuberculosis is a late manifestation in pigs, which is what one expect seeing that the origin in pigs is generally due to ingestion The comparative line of development in the bovine and porcine is—

Ox		*Pig*	
Lungs (primary)		Cervical or mesenteric gland (primary)	
Mediastinal *glands*	Lymphatic extension	Lungs (miliary) extension by the blood stream	
Pleura		Mediastinal glands Pleura	Lymphatic extension via the lungs generally but infection may have been conveyed by the blood stream

In the ox the disease has frequently not extended by the blood stream at the time of pleural attack, but in the pig it has, thus the lung affection following cervical infection would be of the miliary type, and so probably tuberculosis of the type disseminated by the arterial blood stream would be developing at the same time as the pleural lesion Pleural lesions in the pig in cases not of primary pulmonary origin are, therefore, nearly always associated with dissemination

The extension from the pleura is to the subdorsal and suprasternal lymph glands with possible future increase of infected material passed into the venous blood channel and so increasing the lung affection

(2) *Auto infection from the lungs* would result in development of either mesenteric or cervical lesions with subsequent development as already suggested In this connexion it is only necessary to state that, as in the case of the pleura and the mediastinal glands, the peritoneal cavity appears to be related to the mesenteric glands, and infection of the cavity may follow infection of these glands and the extra ordinary development of the disease may likewise also be due to friction

(3) and (4) *Development by way of the arterial system and extension of tubercles round the primary lesion* —The tendency of tuberculosis in cattle is towards the establishment of a chronic condition rather than an acute This shows itself in the formation of a fibrous tissue delimiting membrane around the primary lesion and degenerative processes in the material enclosed, which often becomes caseous and calcified This enclosing tissue would appear to prevent much extension by way of the arterial system from the average primary lesion Occasionally there must be an escape, but not always enough to set up a lesion in other organs, though at times even this happens, but dissemination in such cases would generally be slight in amount On the other hand, tubercles may develop as a result of infective particles from other centres forming emboli in the lung capillaries There is more probability of escape of infection into the arterial blood supply at the time the emboli form in the lung than during the later growth of the tuberculous foci and therefore miliary tubercles in the lungs are more likely to be associated with dissemination by the arterial system than are primary centres Primary centres, however, may take on more acute development and tubercles may develop at the periphery The risk of dissemination in such cases is probably equal to that of the growing embolic centres but less than results from the original release of infection which gave rise to miliary lesions The risk, however, is greater than is observed in the chronic type of primary lesion Miliary tuberculosis of the lungs is therefore the condition which most frequently renders a whole carcass unfit for human consumption, acute primary lesions with evidence of recent active growth are next in importance, and chronic primary lesions of least importance

It does not always follow that the dose of infection which sets up miliary tuberculosis in the lungs is sufficient also to set up lesions in the organs beyond There is some general relationship between the extent of pulmonary deposit and probability of deposit in other organs If the animal lives for some time after the infection has escaped into the blood stream growth of the lesions in both lungs and organs will continue, and at the inspection the probability of simultaneous infection can be ascertained From the meat inspection point of view, therefore, account requires to be taken of the age of the miliary deposit in the lungs, and the extent. Early deposits must be regarded as dangerous, whilst in older cases the actual location of the lesions becomes a [illegible] more decisive factor In recent cases, if the lesions are limited to one organ beyond the lungs there seems to be very little risk in passing the carcass, and if two organs are involved but the deposits are old and not numerous the same deduction appears to me to be justifiable In cases where doubt arises [illegible] examination of the glands of the carcass assists in the decision.

The organs affected by the arterial blood [illegible] the liver (not forgetting the possibility [illegible] infection), the spleen, the kidneys, the internal genital organs, the bones, joints, and muscles The glands which may be affected in arterial extension are mainly the prescapular, the precrural the external inguinal or supra mammary, the popliteal, and probably the ischiatic (this is never examined) Although infection of these lymphatic glands is generally indicative of arterial dissemination, the possibility of inoculation tuberculosis should not be overlooked In these cases infection of the gland may arise by way of the lymph stream, and the position is that of a localised infection Instances of this are not frequent in meat inspection work

CONSIDERATION OF THE RECOMMENDATIONS OF THE ROYAL COMMISSION RESPECTING THE CONDEMNATION OF TUBERCULOUS CARCASSES

The recommendations of the Royal Commission so far as they relate to tuberculosis observed in the carcasses of cattle may be considered in detail at this point

The Entire Carcass and all the Organs may be Seized

1 *When there is miliary tuberculosis of both lungs* —Miliary tuberculosis does not arise as a primary manifestation, nor does miliary tuberculosis, except on rare occasions, affect one lung only It is an incident in the development of a primary lesion which has formed in one of the positions already stated The new tubercles around an actively growing primary lesion in the lungs are not embolic in origin and therefore do not give rise to the same risk of dissemination by the arterial blood stream, as do lesions of the embolic type Miliary tuberculosis of the lungs results from infection of the venous blood stream, and is the most serious lesion in tuberculous carcasses but for reasons stated this recommendation seems too exacting, as I believe some carcasses so affected may be saved

2 *When tuberculous lesions are present on both the pleura and peritoneum* —Lesions so situate are no proof that the infection has either been conveyed by the arterial or venous, blood supplies They may, in my opinion, be entirely lymphatic in origin, as already described In general the rule as it stands is sound, owing to the extensive character of the lesions making it impossible to remove the affected tissue, to the consequent effect on the system generally, and to the probability of many lymph glands being implicated, rendering complete investigation a matter of considerable difficulty Nothing however, is said in the recommendations respecting affections of one or other serous surface separately They are, in my experience, not affected without other associated lesions—that is the pleura without one or more of the lymphatic glands in the mediastinal space and the peritoneum without an associated lesion in the mesenteric glands Probably one serous surface may also be affected by the other by directly intercommunicating lymph channels on the diaphragm, or the pleura from the peritoneum by the roundabout way of the posterior mediastinal gland which receives lymph from some part of the upper surface of the liver

In the case of affections of the pleura I am of opinion that total destruction of the forequarter is not necessary in every case Provided the lesion on the parietal pleura is single, of limited extent, say not more than the size of the palm of the hand in area and the subdorsal and suprasternal glands show no signs of infection, I think it would suffice to remove the part of the chest wall on which the lesion is located together with a fair margin extending beyond , in addition the remaining parietal pleura should be stripped, but this should only be done under the immediate supervision of an inspector In those cases where the lesions are multiple and extensive and the glands affected, the whole affected forequarter should be condemned In the case of the peritoneum a similar limited localisation should be dealt with by wide removal of that part of the abdominal wall which is affected In more extended cases condemnation of the hindquarters is called for In either of these instances if there is evidence of extension by the arterial blood stream as shown by affection of certain lymph glands, the whole carcass should be condemned The lungs and associated glands should invariably be condemned if the pleura is affected, and the intestines and mesentery in the case of the peritoneum

3 *When tuberculous lesions are present in the muscular system or in the lymphatic glands embedded in or between the muscles.*—The obvious intention here is to prevent the sale of meat which has been affected by the arterial blood stream Lesions of the muscular tissue are rare. It is generally assumed that the lymph removes whatever infection may reach the muscle, and that the glands draining these areas will develop the tuberculous lesion A lesion in the muscular tissue, excluding the rare condition of direct extension from a lesion in some other tissue, indicates infection by the arterial blood supply , similar significance attaches to lesions of bones, joints, and sexual organs, and also infection of the spleen and kidney

It would be better definitely to state the glands the affection of which is regarded as being of sufficient importance to justify condemnation of a whole carcass The term "embedded" in or between muscles is not precise. It might be argued with some show of reason that some of the cervical, prepectoral, suprasternal, subdorsal, and certain glands of the hindquarter are embedded in muscle, but the significance of their being affected is not so great as to justify total condemnation The glands having the importance which is suggested should be limited to those already enumerated

4 *When tuberculous lesions exist in any part of an emaciated carcass*—This recommendation is obviously sound. Emaciation always calls for condemnation whatever the disease which gives rise to the emaciation

No reference is made in the regulations to the requirement of condemnation in cases of associated infection of septic origin This condition is more generally found in connexion with primary lesions, and the chief point for consideration is size, in association with acuteness of symptoms, both local and general In acute cases insufficient delimitating membrane may exist which allows of extensive absorption , this gives rise to feverish symptoms or those of toxæmia evidence of which is found in colour and smell and setting of the meat and possibly in the lymphatic glands These cases are considered from the ordinary standpoint of septic infection, with the additional factor that it is superimposed on a tuberculous lesion

The Carcass, if otherwise Healthy, shall not be Condemned, but every Part of it containing Tuberculous Lesions shall be Seized

1 *When the lesions are confined to the lungs and lymphatic glands*—No exception can be taken to this recommendation It is only necessary to remember that when miliary lesions have become associated with the primary lesion condemnation of the whole carcass may become necessary, but this is provided for by a separate recommendation Certain acute primary lesions and complications such as large abscesses may call for condemnation of carcasses

2. *When the lesions are confined to the liver*—They are practically never confined to the liver,[1] the portal gland is soon affected and the mesenteric glands are usually infected in cases where the arterial blood supply has not conveyed the infection In this latter instance the lungs would generally show infection and thus transfer the case to another group If the glands as suggested are included, the advice would be acceptable

3 *When the lesions are confined to the pharyngeal gland*—It is not a very infrequent occurrence for bovine animals to show tuberculous lesions alone in these glands and when affected they are generally evidence of infection by feeding and in young stock. In these instances condemnation of the parts drained by such glands would meet the case

4 *When the lesions are confined to any combination of the foregoing but relatively small in amount*—The combinations are as follows —

(*a*) Tuberculosis of the pharyngeal glands with pulmonary lesions These latter may be primary or secondary If primary the recommendation is sound, but if secondary the lung lesions will be of the miliary type, and the case thus transferred to another group for decision Additional combinations occur later according to the distribution by the arterial system

(*b*) A primary lesion in the lungs with embolic foci in the liver In this case the primary lesion in the lungs may be of the chronic type and the liver lesions single or few, in which case the rule would be sound On the other hand, the lung lesion may be acute, which would require greater significance to be paid to liver lesions and indicate the necessity for careful decision If the primary lesion was such as to suggest that escapes of infection into the arterial stream might be frequent, condemnation would be necessary

(*c*) Embolic foci in the liver (regarded as an extension from a primary lesion in the mesenteric glands) with secondary deposits in the lungs These latter would transfer the case to the miliary group for classification.

(*d*) Lesions in the mesenteric glands and liver, together with lesions in the pharyngeal glands—an unusual combination as a primary condition If there is extension to the lungs either from the abdominal or cervical lesions the classification would again be that of miliary tuberculosis, but with lungs free the recommendation is acceptable, as there would be no evidence of infection having passed the lungs

SUGGESTED COURSE OF ACTION WHICH SHOULD BE TAKEN IN CASES OF BOVINE TUBERCULOSIS

Congenital Tuberculosis

The carcasses of calves showing congenital lesions should be condemned together with all organs

Note—Congenital cases may not be recognisable as such if the animals are several months old when slaughtered owing to the considerable development of secondary lesions which makes it impossible to decide which are the earliest lesions The distribution of the lesions in such cases would call for condemnation even if the origin were not congenital

In early cases of congenital tuberculosis the lesions in the liver spleen, and kidneys are easily recognised as being older than those in the lungs or the mesenteric glands or the systemic glands They are also generally of more than one stage of development, and the pulmonary lesions are always of the secondary and miliary type

Acquired Tuberculosis

The seat of the original primary lesion or lesions should be ascertained if possible If this cannot be done a decision will require to be made based on the distribution of existing lesions

1 When the primary lesion is in the lungs, condemn the lungs and the associated lymph glands

(*a*) If there is extension of the infection to the cervical glands, condemn the head and neck Examine the prepectoral glands and remove them whether tuberculous or not

(i) If there has resulted secondary extension to the lungs in the form of miliary tuberculosis condemn the whole carcass if the deposit is considerable

If the deposit is of lesser degree, examine the liver, spleen, and kidneys and their associated lymph glands, and if recent deposits are noted in any two of these organs or their lymph glands, condemn the carcass

If deposits exist in only one of these organs, or if in two they are not of recent development as shown by size and fibrous encapsulation, examine the prescapular precrural, external inguinal or supra mammary and popliteal lymph glands, and if any one or more of these glands is affected condemn the whole carcass Only affected organs and glands need be condemned in other cases

(*b*) If the primary pulmonary lesion or lesions are of an acute character as shown by the development of tubercles around the original sites of infection together with a minimum amount of fibrous tissue, regard the case as equivalent to miliary tuberculosis and deal with the carcass as in 1 (*a*) (i)

---

[1] This sentence is qualified because of the possibility of infection reaching the liver by means of a vein in the intestinal mucosa.

(*c*) If the lesions (generally primary) are complicated by septic processes the effect of this on the meat should be considered, and a more serious view of the condition should be taken than when a septic process exists apart from a tuberculous affection

2 When the primary lesion exists in the mesenteric glands, condemn the mesentery and the intestines and also the liver and portal glands whether these organs show macroscopic lesions or not

(*a*) If the disease has extended to the lungs in the form of miliary deposits, deal with the carcass as set out in 1 (*a*) (i) As a measure of additional safety in these cases regard the liver as having been infected by the arterial blood stream from the lungs if tubercles of two or more different ages are observed in that organ

3 In cases of double infection such as a primary lesion in the lungs and infection of the mesenteric glands (generally resulting from auto infection), condemn the lungs and associated glands, the mesentery, and the liver and portal glands

At a later stage when miliary tubercles in the lungs are in evidence deal with the carcass as in 2 (*a*)

Note —Owing to the fact that the centres of infection are increased in these cases, miliary deposits are more likely to follow in succession, and therefore it is necessary to ensure that recent deposits are not overlooked In cases of doubt the decision should be in favour of condemnation

4 In a case of primary lung infection with secondary extensions to both the cervical and mesenteric glands deal with the carcass as though three separate foci existed. Condemnation of the whole carcass requires consideration if the animal is emaciated or if miliary tubercles have also formed in the lung, in which connexion observe the note in paragraph 3

5 Inoculation lesions should be regarded as primary lesions until proof of extension by the venous blood stream exists, as shown by miliary deposits in the lung When this stage is reached deal with the carcass as set out in 1 (*a*) (i)

6 Tuberculous carcasses should be wholly condemned if emaciated, or if the animals are slaughtered whilst in a condition of fever

7 If tuberculosis of the pleura exists, provided the lesion on the parietal pleura is single, of reasonably limited extent and the subdorsal and suprasternal glands show no signs of infection, the part of the chest wall bearing the lesion may be removed and the rest of the joint passed for human consumption It would be an additional precaution to strip the pleura from the rest of the affected chest wall but this should be done only under the supervision of an inspector Stripping of the pleura should not be allowed except under supervision When the lesions are multiple and extensive and the glands are affected the whole forequarter should be condemned More extensive lesions may be permitted on the visceral pleura than on the parietal without requiring condemnation of the forequarter

8 If tuberculosis of the peritoneum is present the part of the flank on which it is placed should be cut away and condemned, allowing a fair margin for safety The abdominal contents should also be condemned The lumbar glands should be then examined If these are free from infection the carcass may then be passed after removal of the affected part but if they are affected the hindquarter should be condemned

9 Tuberculosis of both pleura and peritoneum combined should be dealt with as though the lesion on each serous surface were being considered separately There does not appear to be sufficient reason to condemn the carcass simply because there is slight double infection Slight lesions in each cavity should be dealt with as in paragraphs 7 and 8

PREVALENCE OF TUBERCULOSIS IN PIGS

An accurate comprehension of the frequency of tuberculosis in pigs can hardly be gained from slaughter house statistics, since variations in the amount of inspection result in pigs in doubtful health being sent to areas where inspection is poorly carried out, and only those supposed to be free from defect being slaughtered where the supervision is most active Variations may arise in districts, which although widely separated carry out equal supervision, and these depend upon the existence of local circumstances which predispose to the condition in pigs For example, pigs from dairying counties which are fed on milk residuals will show a greater percentage of tuberculosis than those from districts where dairying is not a feature For these reasons the returns of the Board of Agriculture,[3] which refer to investigations conducted in different parts of the country, are particularly instructive

In the report of the Chief Veterinary Officer for 1914 details are given respecting pigs which were found to be tuberculous at the time of examination, and which were slaughtered as part of the procedure in swine fever investigations Out of 8632 pigs of all ages so slaughtered 989 were found to be tuberculous This represents a percentage of 11 5, and is undoubtedly a surprisingly high total but, fortunately, it cannot be regarded as representing the average It often happens that an owner possesses a herd which includes many thriftless and ailing animals, and he may consider that the herd is affected with swine fever He notifies the Board, but investigation with post-mortem examination, shows the condition to be tuberculosis This fact would materially increase the percentage of tuberculous infected pigs among those examined by the Board On the other hand the percentage observed in slaughter houses is probably too low owing to the animals being selected if they are taken to a district to be slaughtered where interest in the work is sufficiently keen to result in statistical tables being prepared The percentage on the Board's figures amounts to 11, and the average for Birmingham, Glasgow, and Brighton is about 3, the percentage for the country as a whole is therefore below 11 and above 3, probably 5 per cent would not be far wide of the mark.

It is a matter of additional interest to note that, as in the case of cattle the risk of infection increases with age and varies from 3 2 per cent in unweaned pigs to 19 6 in boars Doubtless a large proportion of the earlier infection results from maternal transmission, and the later increases follow infection from feeding on tuberculous offal either of animals or poultry The actual figures are as follows (Table V) —

TABLE V

Description.	No of pigs examined	Number affected	Percentage affected
Unweaned	1395	47	3·2
Fatting	1841	178	8·8
Stores	4401	594	11·9
Sows	913	150	14 1
Boars	92	20	19·6

As stated, the percentage of infection is much higher than that reported from either English or foreign slaughter houses, a series of which is shown in Table VI —

* La Tuberculose du Por par P Chausse
† Hygiène de la Viande et du Lait 1913

Of 368 428 Dutch pigs slaughtered for export to London, 5516, or 1 5 per cent, were found to be tuberculous

The variations shown in the different districts and countries are the result of several factors, not the least important being the manner of feeding already referred to It will be noted that in Copenhagen and in Denmark as a whole where there is considerable dairying work there are higher rates than in other districts Mohler and Washburn[4] have also drawn attention to the same fact They report that of

---

[3] Annual Report of the Chief Veterinary Officer of the Board of Agriculture for 1914 (Cd 8043)

[4] Tuberculosis of Hogs by J R Mohler and H J Washburn United States Department of Agriculture

325 000 pigs slaughtered in Forth Worth Texas, where the animals are raised on alfalfa supplemented with grain, only 51 or 0·016 per cent were condemned as unfit for food, as compared with 3 1 per cent. 3·4 per cent, and 6·4 per cent. respectively condemned in the same period in three cities in one of the leading dairy States

DIFFERENCES BETWEEN BOVINE AND PORCINE TUBERCULOSIS.

There are several important points of difference in the behaviour of tuberculous infection in the pig and the ox. Primary inhalation tuberculosis is the more common method of infection in the ox intestinal lesions in the form of tuberculosis of the mesentery or cervical glands being often the result of auto infection or of dissemination Primary intestinal infection is uncommon apart from the congenital cases and the few cases in calves which follow the ingestion of infected food On the contrary the intestinal type is the common affection of pigs sent for slaughter to provide human food. For this purpose they are mostly slaughtered when less than 8 months old. The different habits of the two animals account partly for the different modes of infection. The calf is a vegetable feeder when it leaves its mother, but pigs feed on animal matter from an early age

The weak spots in the digestive tract are asserted by Chaussé[1] to be the tonsils in the upper part and Peyer s patches and the solitary glands in the intestines The latter are histologically comparable with the former He assumes that traumatism plays a considerable part in producing the lesion. Whether this be so or not it is the fact that lesions are fairly frequently found in the tonsils, though I have not observed the same in the intestinal glands It is by no means a regular occurrence to find the tonsils showing abnormality, even when the submaxillary glands are the seat of disease

Pigs also are much more susceptible to infection by the tubercle bacillus than are other food animals The bovine, human and avian types of bacilli all produce lesions in the pig and although there is apparently a different intensity or virulence dependent upon the type of attacking organism it is not possible to be certain from macroscopic appearances which type is present in any particular case

The infection in the pig is more progressive than in bovines In the latter retrogressive changes and chronicity are features but in the pig the disease progresses more rapidly and fibroid changes are not so frequently met with dissemination being the rule rather than the exception, and that within a few months of infection. The dissemination also appears to be more extensive since the liver and spleen frequently show many more lesions than is the case in bovines and also at an earlier date, when the characteristics of the primary lesion in each are compared

This increased susceptibility and greater power of extension by the blood stream probably also account for the greater frequency of infection of the systemic lymphatic glands and of lesions in the bony skeleton which are met with as compared with corresponding conditions in bovines

TYPE OF TUBERCLE BACILLI OBSERVED IN PIG TUBERCULOSIS

Various observers have investigated the type of the bacillus which gives rise to tuberculosis in pigs since the Royal Commission directed attention to the fact that tuberculosis in the pig might be due to bacilli of the bovine avian, or human type 59 cases were examined for the Commission with the following result (Table VII) —

TABLE VII

Degree of tuberculosis in the pig	Bovine virus	Human virus	Avian virus	Mixed avian and bovine	Total
Local tuberculosis	17	3	5	—	25
Generalised	32	—	—	1	33
Total	49	3	5	1	59

Eastwood and Griffith[2] obtained tubercle bacilli in culture from 78 pigs and of these 26 were of the avian 47 of the bovine, and 1 of the human type There was one instance of mixed avian and bovine and one of mixed bovine and human, whilst in two instances atypical types were recognised It follows that in the Royal Commission s cases of pig tuberculosis 5 out of 59, or 8 5 per cent., were due to avian tuberculosis, and in Eastwood and Griffith s cases 26 out of 78 or 33 per cent

As bearing on these figures it is interesting to note that the Commission state in the guinea pig the avian bacillus does not induce progressive tuberculosis, and the lesions produced may be "minimal," and further, "in our experience the bovine bacillus only has been found to be the cause of natural generalised tuberculosis in the pig" Another conclusion arrived at was to the effect that "a mixed infection with human and bovine tubercle bacilli must be considered possible in the pig although it was not found in any of the cases investigated by us" Eastwood and Griffith discovered one such case

Christiansen[3] examined 118 tuberculous pigs and determined the type of bacillus in 114 cases Of these he found the disease was due to the avian type in 86 instances (75 5 per cent) and to the bovine in 28 (24 5 per cent) These totals show a much higher percentage of avian infection than in those already mentioned and probably local circumstances relating to the manner of feeding or the prevalence of fowl tuberculosis might account for it It should be remembered that the cases examined both by the Royal Commission and Eastwood and Griffith were selected cases In the former group, attention was directed mainly to slight cases of tuberculosis, and in the latter the investigation related to tuberculous lesions macroscopically limited to the primary seats of infection

INSPECTION OF PIG CARCASSES

The recommendation of the Royal Commission in cases of pig tuberculosis is to the following effect —

> In view of the greater tendency to generalisation of tuberculosis in the pig we consider that the presence of tubercular deposit in any degree should involve seizure of the whole carcass and of the organs

This is an extremely sweeping recommendation and remembering the considerable prevalence of tuberculosis in the pig it demands the fullest justification if it is to be literally observed. I have failed to discover in the report of the Royal Commission any evidence in support of the recommendation. A decision as to whether such a high standard is really necessary may best be arrived at by studying the location of the disease in pigs

Christiansen as already stated examined 118 pigs and ascertained the type of bacillus present in the lesion, he also classified the lesions as follows (Table VIII) —

TABLE VIII

Tuberculous lesions	No of pigs examined	Type of bacillus present		
		Avian	Bovine	Undetermined
Localised to mesenteric lymphatic glands ...	61	58	1	2
Localised to cervical glands	15	7	7	1
Affecting both mesenteric & cervical glands	9	9	—	—
Affecting lymph glands generally and viscera	33	12	20	1
Total	118	86	28	4

It will be observed that in the avian type of infection there is a great tendency to infection of the mesenteric glands, and that there is a greater frequency of generalisation in the bovine type 20 out of 28 cases, than in the avian 12 in 86 instances The tabulation as given would appear to suggest that of the 118 cases it would only have been justified to condemn the whole carcass in 33

As regards English experience the cases investigated by Eastwood and Griffith may be used, as these workers give sufficient information to allow of conclusions being drawn from the meat inspection point of view This work was conducted mainly from the pathological standpoint, but I have their permission to use their records in the manner suggested

Infection of mesenteric gland with extension to liver and later to lungs	—	1	A. 23
Totals	22	21	—

* M = Mammalian A. = Avian

† In Case 47 the submaxillary gland was tuberculous and possibly one mesenteric gland The lungs showed lesions but not the bronchial glands The liver was normal though there were two or three caseous foci in the portal gland The case is regarded as one of double primary infection with extension to the lungs from the cervical glands

‡ In Case 53 infection in the lungs was demonstrated by inoculation of apparently healthy tissue There were no macroscopic lesions

Of the above cases 22 were instances of infection by the mammalian type of bacillus and 21 by the avian. There is no suggestion of special incidence of infection of the mesenteric glands All are instances either of strict localisation or of extension only by way of the venous blood stream, the possible exceptions to the latter being Cases 48 94, 50 and 53 In these it is not possible to state definitely whether the liver was infected by way of the portal vein or the hepatic artery It was probably the former, as no other lesions were discovered, and the spleen and inguinal glands (the only systemic glands examined) were free

All these carcasses might safely have been passed for human consumption after condemnation of the head and neck and internal organs

In these cases there does not appear to be much difference in distribution between those due to the mammalian type of organism and those in which the avian bacillus was found, but in considering more extensive dissemination in which the arterial blood stream appears certainly to have conveyed the infection, the differences are more pronounced A definite conclusion that the arterial blood stream has been the means of conveyance is assumed when the liver is infected without associated lesions in the mesenteric glands or where the spleen is affected

TABLE X—*Instances of Disseminated Mammalian Infection*

41	+	+	+	—	+	—	—	—	25	—	+	+	?	+	+	+	+
45	+	+	+	—	+	+	—	—									

Table X shows the location of the lesions in cases of arterial dissemination. The first series consists of cases in which the primary lesion was in the submaxillary glands, and the second in which there were probably two seats of primary infection—viz, mesenteric glands as well as submaxillary, the single case in the third group (No 25) showed no lesion in the cervical gland and the mesenteric gland was not examined It is possible that the primary deposit was in these latter glands, and dissemination followed the usual course

It will be observed that the liver was affected in association with a primary lesion of the submaxillary gland, but without splenic lesions in three instances, and with lesions of the spleen in 10 In the five cases of double primary infection the spleen contained tuberculous lesions in all. The spleen and inguinal glands were affected in Case 25

All the above were instances of infection with the bovine bacillus, and in all there were lesions in the lung No instance of similar combinations resulting from avian infection was observed This is interesting, but it is important to note that in both avian and bovine infections dissemination by the arterial stream would seem to be frequently possible without lesions showing in the lung It is not easy to account for the disposition of certain lesions except on this hypothesis, and I have frequently seen instances in which the most careful examination of the lung has failed to indicate the presence of lesions when they have been observed in the liver, the mesenteric glands being free or if the latter was affected, then in the spleen Unless such a possibility is granted it would require the suggestion of backward flow to the splenic gland, and thence into the parenchyma of the organ to account for it

The grouping of these cases is set out in Table XI —

TABLE XI—*Instances of Dissemination by the Arterial Blood Stream without Macroscopic Evidence of Disease in the Lungs*

99	+	—	+	—	?	—	—	—	Infection of bronchial gland suggests infection by way of lungs.

* Not examined. T B = tubercle bacilli

In the above cases, therefore the organisms were discovered in situations which would indicate that they must have passed through the lungs to reach the localities where they were found, and in doing so had failed to give rise to recognisable lesions There seems a greater possibility of the avian type getting free without giving rise to pathological changes than of the mammalian, for it will be seen that in the avian infections the organism was discovered in four instances in spleens which show no macroscopic lesion, whereas in the mammalian cases lesions were observed in the two spleens in which bacilli were demonstrated in apparently normal tissue Possibly the greater virulence of the mammalian type gives rise to an earlier reaction of the tissues which would tend to enclose the primary focus whilst the tissue being more tolerant of the avian, escape is more easy and frequent. In any event the frequency of bacilli in organs, apart from recognisable lesions, would indicate that in tuberculous infection of any degree in the pig the internal organs should be condemned

In the case of pigs in which infection resulted from intentional feeding on infected material the same results were observed Several of the infected animals might with safety have been passed for human food, and in certain organs bacilli were found apart from recognisable lesions Table XII gives the situation of the lesions in animals purposely infected

TABLE XII.—*Location of Lesions in Pigs found to be Tuberculous after Feeding on Infected Material*

K = kidney

Of the above, Cases 4 5, 10, and 17 might certainly have been passed for human consumption Cases 6 and 9 might have been passed assuming the systemic glands had been free from infection and the lesions in the lungs slight Case 11 shows severe dissemination from infection of the kidney, and Case 12 from infection of the spleen. In Cases 13 and 14 the pigs were fed with the human type of bacillus, and again these could have been passed assuming the systemic glands had been free, and in the case of 13 the lungs only slightly affected In all cases internal organs would require to be condemned and the vertebral column split open and examined and the affected heads and necks removed and condemned

In these animals the presence of tubercle bacilli was demonstrated in apparently healthy organs in two out of three lungs and one out of nine submaxillary glands examined In the case of apparently healthy tissue from organs showing lesions of tuberculosis bacilli were demonstrated in one only out of three examinations of lung tissue, but in three out of four examinations of liver tissue.

Negative results followed the examination of apparently healthy bronchial gland (1 case) mesenteric glands (2 cases) liver (2 cases), and spleen (6 cases) Apparently normal tissue taken from organs showing lesions gave a negative result in one case each of submaxillary gland and mesenteric gland

DIFFERENCES BETWEEN LESIONS OF AVIAN AND BOVINE ORIGIN IN THE PIG

The slight pathogenicity of the avian bacillus for man would appear to suggest that if any striking characteristics existed between the types of lesions produced by the avian and bovine bacilli respectively which admitted of recognition by a meat inspector a differential treatment of affected carcasses might be desirable Eastwood and Griffith consider this point and state that —

> When the infection was due to the typical bovine bacillus the glands were commonly enlarged, often to a marked extent and frequently the adjacent glands had become fused into a coherent mass On section the gland substance was often found to be partly or completely replaced by fibro caseous, gritty material embedded in a firm, translucent matrix. When the infection was due to the avian bacillus, the glands were often not enlarged and when enlargement was present it was usually slight or only moderate in amount On section the glands were found to contain a varying number of caseous and gritty or calcareous nodules, which were easily shelled out of the surrounding gland tissue and left behind smooth fibrous walled cavities But there were several instances where the macroscopic appearances failed to give correct indication of the type of bacillus causing the infection

In these circumstances it is therefore obvious that reliable differentiation is not possible and that tuberculous lesions in the pig must all be regarded from a standpoint which ignores the type of the infecting organism and any regulations should be framed with the object of safeguarding the consumer against the type showing the greatest pathogenicity

ACTION ADVISED IN THE CASE OF PIG TUBERCULOSIS

In general there does not seem to be sufficient reason why the general principles regulating the inspection of bovine carcasses should not be applied to the inspection of pig carcasses provided due weight is paid to the special points of difference which are known to exist. These are as follows —

1 Primary infection of the lungs in pigs is met with only infrequently in slaughter-houses Lesions in the lung are therefore nearly always of the embolic type Primary infection of the digestive tract, on the other hand, is the common form

2 The ratio of cases showing lesions carried by the blood stream is higher in pigs than in cattle and therefore total condemnation must of necessity be more frequent

3 The lungs frequently fail to show lesions when these are present in other organs so that absence of lesions in the lungs does not justify the assumption that there has been no dissemination.

4 Tuberculous lesions of bones and joints are more frequent in the pig than in the ox.

5 Dissemination follows with fair rapidity and the disease is generally progressive in pigs On this account and for reasons above mentioned tuberculosis in the pig, in even slight amount in the cervical or mesenteric glands, requires as a routine (*a*) the examination of all organs, if these are available, (*b*) the examination of bones and joints particularly the cervical column, by splitting down, and the ribs for nodules, as well as a careful inspection of the hock-joints, opening these up if necessary, and (*c*) an examination of the prescapular, precrural, and supramammary glands Any evidence of deposit in situations (*b*) and (*c*) calls for condemnation of the whole carcass

6 The pig is prone to attack by any of the three types of organism In numerous instances the internal organs contain living bacilli without macroscopic evidence of the disease The internal organs of a tuberculous pig should always therefore, be condemned. This recommendation may be criticised from the point of view that if bacilli rest in the organs they may likewise do so in the tissues, and therefore if it is necessary to condemn organs it should be necessary to condemn the carcass The reasons against this are that the organisms which do not give rise to lesions are mostly of the avian type The mammalian type is usually associated with macroscopic lesions The bacilli seem able to reside in these organs for a longer period than in the muscular system In the latter case they soon appear to pass into the lymphatic glands and either set up lesions or are destroyed Note the few instances in which mammalian bacilli were found in organs apart from lesions

7 Pigs are often submitted for sale in wholesale markets with the heads and necks or lymphatic glands removed No organs either are attached. Power should be given to condemn such carcasses, as these removals are generally on account of tuberculous infection and it is essential that the character of the lesion should be examined in certain instances

8 Tuberculosis of the pleura and peritoneum is not so common in the pig as in the ox and when it does exist it is usually a later manifestation in the former than in the latter and much more frequently calls for total condemnation

---

POOR LAW MEDICAL OFFICERS SALARIES—The Axminster (Devon) board of guardians have decided to increase the salaries of their district medical officers by one third for the duration of the war

TUBERCULOUS SOLDIERS IN CORNWALL.—At the last meeting of the Cornwall County Council a letter was read from the Cornwall Patriots Committee, offering to erect a suitable home for sailors and soldiers who were suffering from advanced tuberculous disease The committee required that a suitable rent should be paid and that after the war the county council should take over the home permanently The county council unanimously resolved to accept this generous offer

THE LATE DR. T HOPE LEWIS, AUCKLAND, N Z—By the death of Dr T Hope Lewis, of Auckland, the profession has lost one of its most respected and well known members At an early age he entered the Navy and after a few years' service he went to New Zealand and took the position of medical officer to the thermal springs at Rotorua At the end of his engagement he commenced practice in Auckland and soon made a name for himself as a surgeon For some months before his death he acted as a consulting surgeon to the New Zealand Forces and it was while on this service that his death took place

THE IMMEDIATE EFFECT OF CIGARETTE SMOKING ON HEALTHY MEN AND ON CASES OF "SOLDIER'S HEART"

By JOHN PARKINSON, M D Lond , M R C P Lond ,
CHIEF ASSISTANT TO THE CARDIAC DEPARTMENT LATE MEDICAL REGISTRAR TO THE LONDON HOSPITAL TEMPORARY CAPTAIN R A M C IN CHARGE OF HEART SECTION AT A CONVALESCENT DEPÔT, B E F
AND
HILMAR KOEFOD, M D Harvard,
OF BOSTON U S A
(*From the Hampstead Military Hospital for Heart Cases*)

In this war, as in wars of the past, many soldiers prove inefficient because they become unduly breathless on the exertion which military service entails The same individuals often complain of præcordial pain, palpitation, giddiness, and exhaustion Some of these cases present the signs of valvular disease of the heart (V D H), and are discharged from the Army on this account Yet in the majority of soldiers with these symptoms no abnormal physical signs are found , these are classified in the Army Medical Service as D A H (disordered action of the heart) , the terms "soldier's heart" and "irritable heart" have also been applied to them A clinical account of these disabilities has been published by one of us[12]

It has been freely asserted that excessive smoking, particularly of cigarettes, is one of the most potent causes of the condition Where so many factors are in operation a definite conclusion as to the truth of this assertion must prove difficult The end results of enforced abstinence from tobacco in these patients would give the most direct answer The difficulties of carrying through such a line of observation and the risk of deception by the patient seemed too great to accept Hence, as a lesser contribution to the problem, we decided to investigate the immediate effect of cigarette smoking on the circulation and on the reaction to exertion of these patients, and to compare this with its effect on healthy soldiers in training The opportunity for this work was obtained at the Hampstead Military Hospital for Heart Cases, where various investigations upon the nature of these disabilities have been instituted in co-operation with the Medical Research Committee

Previous Observations

We have attempted to abstract all the chief published observations on the immediate effect of tobacco smoking on the circulation of healthy men The literature abounds in clinical accounts of patients whose symptoms or diseases are ascribed to excessive smoking , with these we are not here concerned, nor with the pharmacological problem of the active or noxious ingredient of tobacco smoke Of some 50 papers abstracted we here summarise all those which contain any series of actual observations on the subject in hand

Hesse[4] observed the effect of cigar smoking on the pulse-rate and blood pressure of 25 subjects, chiefly patients with various chronic diseases One reading was taken before smoking and one after each cigar In the majority there occurred an increase in pulse rate, together with a rise in blood pressure

Lee[6] has contributed an important paper on the subject From observations on eight healthy men he concludes as follows In the novice there is always an initial rise of systolic blood pressure (10–20 mm Hg), and the pulse is quickened somewhat Symptoms of shock and collapse are followed by a fall in pressure In moderate smokers the blood pressure rises slowly (10 mm Hg), and this is usually associated with acceleration of the pulse In an excessive smoker the pressure rises 2–4 mm , and the pulse is unaffected

Bruce, Miller, and Hooker,[2] from observations on two healthy young men accustomed to moderate smoking, conclude that after smoking (pipe, cigar, or cigarette) there is usually an increase in heart-rate The increase is not great and may be absent altogether, even when the blood pressure shows distinct changes The maximum and minimum pressures usually rise slightly, the maximum the more, so that the "pulse pressure" tends to increase

An article by Nicolai and Staehelin,[10] though it contains no observations on the immediate effect, is noteworthy as a serious attempt to ascertain the effect of smoking continued over a period of six months During this time each of the authors smoked 6–8 cigars daily, then they abstained from smoking for six months In Staehelin's own case the pulse rate, as shown by the mean rate on three days, was 82 during the smoking period and 75 during the period of abstinence Similarly the pulse rate after a standard exertion was 157 compared with 124 per minute Not only was the pulse-rate after exertion higher during the smoking period, but it took much longer to return to the normal The blood pressure was rather higher during the months of smoking, but the readings were not uniform In the case of Nicolai himself similar results were obtained, but the figures were unfortunately lost

John[5] tried the immediate effect of smoking two cigars on nine patients with various chronic diseases The von Recklinghausen apparatus was used to determine diastolic pressure, and a few individual charts are produced He concludes that there is a clear increase in diastolic pressure while the systolic pressure is variously affected, and that the pulse sometimes decreases in rate

Frankl Hochwart[3] records extensive observations on the effects of smoke laden atmospheres Of 28 healthy doctors thus exposed passively to the effect of smoke, 23 showed some change in blood pressure ; in half of them it fell The effect of actually smoking three Egyptian cigarettes during 3–12 minutes was observed in seven smokers and three non smokers If affected at all, the blood pressure generally fell, but the change both in pressure and in pulse rate differed greatly in different subjects A combination of active and passive smoking produced the greatest changes Denicotinised tobacco had little effect It does not appear that more than one observation was made before and another after smoking in these experiments

Aikman,[1] in a careful article on the effect of smoking on the circulation, includes his own experiments on 28 young healthy smokers, using a single Turkish cigarette in each case Of 27 cases, the pulse rate increased in all but 4, and 16 showed an increase of more than eight beats per minute In four heavy smokers the pulse increased by over 40 beats He noted an initial decrease of 4–6 beats in three cases He claims that the pulse became "irregular" in ten cases, but the nature of the arrhythmia is not stated and no graphic records are furnished The effect on the blood pressure and the "pulse pressure" was varied

Class of Case

The patients were soldiers between the ages of 17 and 32 They all complained of undue breathlessness on exertion, what is more, they appeared more breathless after simple exercises than did healthy men Other symptoms such as præcordial pain, palpitation, giddiness, and exhaustion, were present in many We excluded all cases which we believed to be suffering from valvular disease or obvious myocardial disease Indeed, no abnormal physical signs were found in any of the cases used The men were not confined to bed, and they left the hospital each afternoon for walking exercise All were smokers, and their habit in this respect is indicated in Table I They were consecutive cases and were not selected because smoking was presumed to be a special factor in the production of their symptoms

The controls were healthy cadets in training, between the ages of 20 and 28 , all were cigarette smokers, and had presented no symptoms while undergoing the usual physical training of a soldier

Most of the patients and controls began to smoke between the ages of 15 and 18 About half the patients and half the controls admitted that they smoked more since enlistment than before Two patients (Cases 4 and 12) and one control (6) first began to smoke after enlistment

The degree of staining of the fingers, which was present in most of the subjects did not prove helpful in estimating the severity of the cigarette habit The use of a holder, the avoidance of smoking cigarettes to the end, and thorough cleansing of the fingers, suffice to prevent much staining even in heavy smokers

Method of Observation

Attention was confined to the effect of smoking on (1) pulse, respiration, and blood pressure, and on (2) reaction to exertion

Before the observations on actual smoking were commenced the patient performed a simple exertion test, and this was repeated when the period of smoking was over

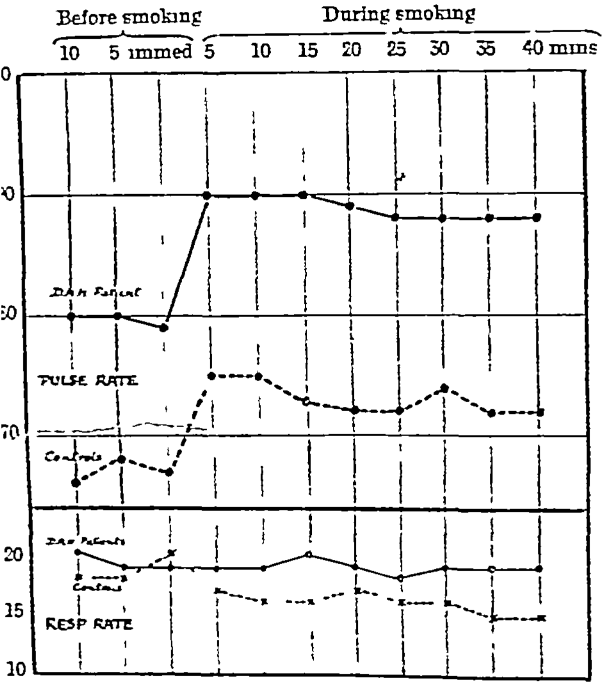
The observations were made in the afternoon (two hours after lunch), at a time when the subjects had refrained from smoking for a period of five hours The Mackenzie ink polygraph was always used to record the pulse and respiration The respiratory rate was obtained by connecting the second tambour of this instrument with a respiratory bag held against the chest wall by a light belt

After the apparatus had been adjusted the patient lay quietly on the bed for at least 15 minutes Half minute records of the pulse and respiration were then taken simultaneously every five minutes until three consecutive readings were practically constant

---

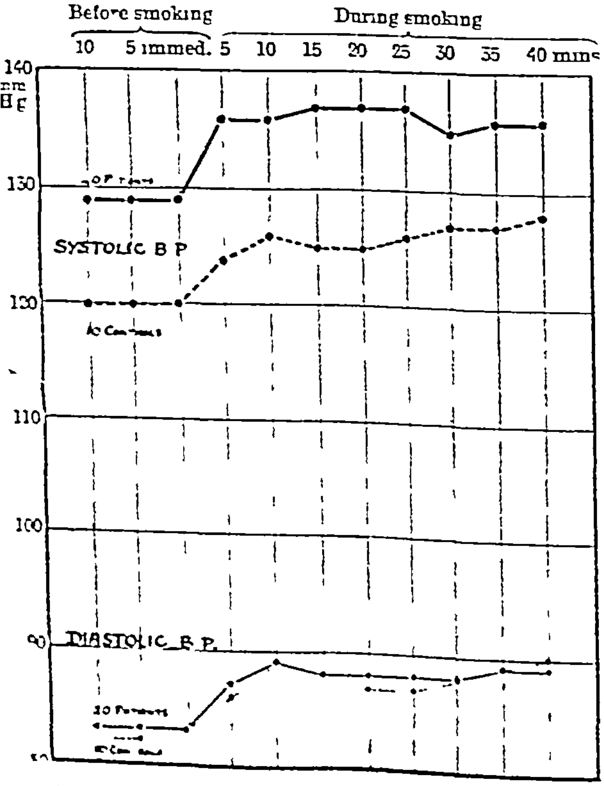
* Undertaken on behalf of the Medical Research Committee

CHART 1



Effect of smoking (4–5 cigarettes) on pulse and respiratory rates in 20 patients (D A.H) and 10 controls (healthy men)

CHART 2



Effect of smoking (4–5 cigarettes) on systolic and diastolic blood pressure in 20 patients (D.A.H.) and 10 controls (healthy men)

Without disturbing the apparatus the patient was then made to stand and a continuous record of the standing rate was taken for two minutes The rate for the first six seconds was considered the *immediate* rate, and is so named on Chart 3, otherwise the record was divided and counted in half minute periods The patient was then disconnected, though the wrist-splint and respiratory bag were left in place, and he was made to walk a few yards to a flight of 25 steps, which he descended and climbed once at a quick walking pace On his return the recording apparatus was reconnected (within three seconds) and a continuous record was taken for three consecutive minutes, with the patient standing As before, the rate during the first six seconds was called the "immediate rate" The patient finally lay down on the bed and a record of two minutes' duration was taken This series of observations will readily be understood on reference to Chart 3 (q v)

The first exertion test having been completed a Riva-Rocci mercurial sphygmomanometer (Martin's modification) was also applied The auscultatory method was used the systolic pressure was read when the sounds first appeared as the mercury fell and the diastolic when the clear loud sounds became soft and murmur like.[6] Blood pressure readings (systolic and diastolic) and pulse- and respiratory-rates were taken at five-minute intervals until three consecutive readings were alike The patient, still lying on his bed was then asked to smoke cigarettes, one after another, until either four or five had been consumed The first cigarette, smoked rather quickly, was finished in the first five minutes and the whole period of smoking occupied about 40 minutes The pulse-rate was recorded continuously during the first five minutes of smoking Subsequently pulse- and respiratory rates and blood pressure readings were recorded every five minutes While the polygraphic record was actually being taken, smoking was suspended so that the respiration curve should not be modified by the act of smoking After the last cigarette three constants of pulse and respiration were obtained and the exertion test, as performed before smoking, was repeated in its entirety

In all the observations a small Virginian cigarette was used, the brand actually employed was that sold under the name 'Wild Woodbine," a cigarette in common use among soldiers The weight of five of these cigarettes was 4 8 grammes and the weight of the unsmoked ends was about 1·4 grammes, thus from 3 to 4 grammes of this tobacco were consumed by each subject

Effect on the Pulse-rate (see Chart 1 and Tables I and II.)

In general there was a moderate increase in the pulse-rate

Among 20 patients the average rate before smoking was 80 and during smoking 89 an increase of 9 beats The rate increased in all cases except three non inhalers in whom it remained constant

In a single case the average pulse-rate before smoking was 64 and during smoking 93 an increase of 29 beats In the remainder the increase ranged from 3 to 15 beats There was a sudden increase in the average rate during the first half-minute of smoking from 80 to 87 and during the remainder of the first five minutes a gradual increase to 93 At no time during the first five minutes was slowing of the pulse observed, either in the average or indeed in any individual case, no preliminary slowing took place, such as is described in animals after the introduction of nicotine It is probable that the initial decrease in pulse-rate sometimes described in man is quite incidental or due to inexact methods of recording rate The pulse-rate usually rose within five minutes (and during the first cigarette) to a maximum which was almost maintained throughout the period of smoking (see Chart 1) Among the inhalers, comprising half the cases, the average pulse-rate during smoking was 11 beats higher than before smoking was commenced, in non inhalers the average increase was seven beats (see Table III)

The average pulse rate in ten healthy soldiers *(controls)* before smoking was 67 and during smoking 73 (see Table II and Chart 1) The increase is rather less than in the D.A.H. patients but similarly the maximum average pulse-rate was reached at the end of five minutes and this rate was maintained throughout the period of smoking The pulse-rate was increased in all but two cases, in one of these the rate before smoking was 68 and during smoking 64, in the other it was unaffected Irregularity of the pulse referable to smoking was not observed in any case of either series, though normal sinus arrhythmia was often seen before and during smoking

Effect on Respiratory Rate (see Chart 1 and Tables I and II)

The average respiratory rate remained unaffected among the patients as a whole and also among the inhalers as a group In half the cases the rate increased slightly, in the other half it decreased In no case was there an increase of more than four per minute

In the *controls* the average respiratory rate before smoking was 18 and during smoking 16 In three cases there was a slight increase, in two it remained unaltered, while in five it decreased In two of the latter the rate decreased by seven per minute during smoking

Effect on Blood Pressure (see Chart 2 and Tables I and II)

In 15 of the 20 patients the blood pressure, both systolic and diastolic, was definitely raised In the remaining 5 cases it rose very slightly or not at all In none did a fall of blood pressure occur

TABLE III.—*The Effects of Smoking on Inhalers and Non inhalers Compared (20 Patients)*

—	Average pulse-rate.			Average respiratory rate			Average systolic blood pressure			Average diastolic blood pressure		
	Before smoking	During smoking	Change	Before smoking	During smoking	Change	Before smoking	During smoking	Change	Before smoking	During smoking	Change
Inhalers (10)	75	86	+11	19	18	– 1	125	136	+11	83	89	+ 6
Non inhalers (10)	84	91	+ 7	20	19	– 1	133	137	+ 4	84	87	+ 3

Systolic pressure—The average systolic pressure rose almost to its maximum during the first five minutes of smoking—i e during the smoking of the first cigarette—at the end of which it had risen 7 mm Hg The increase was maintained and varied little during the whole smoking period In 5 cases the blood pressure did not rise until ten or more minutes had elapsed Among the inhalers (half the cases) the average systolic pressure rose 11 mm, in non inhalers it rose 4 mm (See Table III) The greatest individual increase was 17 mm Four of the five patients in whom the rise was insignificant were inhalers

The average systolic blood pressure in the *controls* rose to its maximum an increase of 6 mm, in the first ten minutes and more gradually than in the D A.H. cases This increase was again maintained, and reached 8 mm by the end of the smoking period The systolic pressure rose in all but two cases which were unaffected, in these the pulse-rate also failed to increase In each of two controls the increase was 15 mm Hg

It is suggested that the fall in blood pressure so often recorded in previous observations only occurs when toxic symptoms have supervened, and then not in all cases (See under Toxic Symptoms)

Diastolic pressure—The average diastolic pressure in the patients rose more gradually than the systolic and reached its maximum, 6 mm, ten minutes after the commencement of smoking, this increase was maintained With one exception, in all cases where the average systolic pressure rose, the diastolic pressure rose also The increase in diastolic pressure among inhalers averaged 6 mm, and among non inhalers 3 mm

The average diastolic pressure in the *controls* rose to 5 mm, the maximum, during the first ten minutes of smoking, and *the increase was maintained* The curve coincides almost exactly with that of the D A.H. series

It is worthy of notice that in repeated and prolonged observations on the blood pressure of any individual the readings tend to fall slightly, even after an apparent constant has been obtained and apart from any pharmacological procedures This may be due either to prolonged rest during the course of an experiment with disappearance of initial excitement, or it may depend on some temporary change in the vessels of the arm after repeated use of the sphygmomanometer cuff Illustrative examples have been recorded in papers by Lee[6] and by Parkinson and Rowlands[11] If allowance were made for this slight fall in pressure during any prolonged observation, the true figures of increase in blood pressure during smoking would actually be rather *higher* than those given.

EXERTION TESTS BEFORE AND AFTER SMOKING

(*See Chart 3*)

The difference in the average pulse-rates on exertion, before and after smoking, though not pronounced, was *definite enough*

The difference was as follows (1) The average recumbent rate was 3–5 beats higher than before smoking, (2) the average standing rate was 8–10 beats higher, (3) the average rate after exertion was 8–10 beats higher, (4) the recumbent rate after exertion was 3–7 beats higher

These differences would not be significant in a single patient, but we are here contrasting the average rate in 20 patients during the exertion test with the average rate in the *same* individuals on the *same* test, but after smoking (See two upper curves in Chart 3)

Controls—The average pulse-curve during exertion tests following smoking, although at a slightly higher rate (2–4 beats), followed the corresponding curve before smoking more closely than in the D A.H series In other words, among the controls the curve of pulse-rate on exertion was scarcely affected by smoking The difference between the curves before and after smoking in D.A.H cases is 8–10 beats, in the controls it is merely 2–4 beats

Incidentally, another difference between D A H cases and controls, not related to tobacco, is shown in Chart 3 In the former the pulse-rate falls neither so rapidly nor so completely after standing and after exertion as it does in the controls

The Breathlessness on Exertion after Smoking

(*a*) *Respiratory rate on exertion*—As described above, under Method of Observation, the respiratory rate was recorded graphically during the exertion tests, together with the pulse rate Curves of the respiratory rate on standing and on exertion, before and after smoking, have been prepared from the average figures obtained, curves similar to those of pulse rate depicted in Chart 3 The respiratory rate curve on exertion before smoking *proved to coincide* almost exactly with that after smoking, smoking did not appear to influence it For this reason, and for lack of space, these curves are not reproduced. The respiratory rate was not more frequent on the exertion test performed after smoking

In spite of this fact, and in the absence of graphic proof we yet consider that *breathlessness* was often greater on exertion after smoking (see paragraph (*b*))

(*b*) *Breathlessness on exertion*—When each subject returned from his first exertion test, that *before* smoking, we both observed the degree of his immediate respiratory distress and noted it, nothing was said to him on the matter When he returned from the second exertion test, that *after* smoking, we again agreed as to the degree of distress and whether it appeared the same as or greater than at the previous test This time the man's opinion was also asked—viz., whether his breath was about the same as after the previous test, or not Often he admitted, with a smile, that his breathing ' was more noticeable on this occasion If we were all in doubt or at variance, the symptom was considered "unchanged.' Whereas if we were satisfied that more objective distress was shown, and the patient felt more breathless, we noted that breathlessness was "increased" (See Tables I. and II)

If, as admitted, the respiratory *rate* was not more frequent on the exertion after smoking, wherein does the breathlessness lie? Probably it is associated with an increased amplitude of respiration The subjects appeared to us to breathe more deeply Unfortunately there does not appear to be any simple clinical method of recording the amplitude of respiration, or rather no method which is sufficiently exact for comparative observations Hence no graphic evidence is afforded in support of the following observations which are tabulated in the fifth column of Tables I and II (q v)

In 12 of the 20 patients breathlessness was more pronounced in the exertion test after smoking, in the remaining eight cases it was unchanged Six of the 12 cases affected were inhalers and six non inhalers so that the "wind" can apparently be adversely affected by smoking even without inhaling

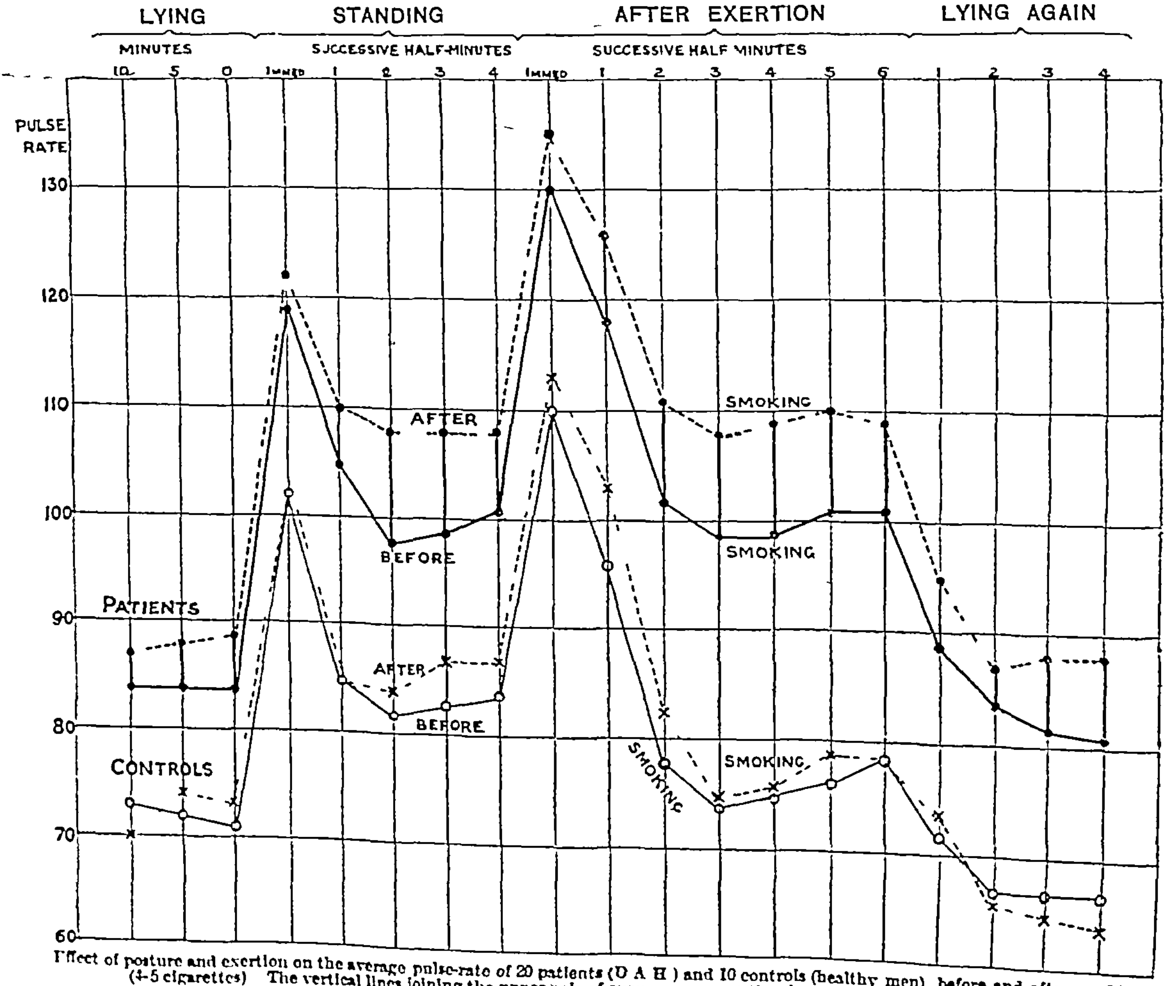
None of the controls showed breathlessness after the exertion test previous to smoking but two of them noticed slight breathlessness on the same exertion *after* smoking and objectively appeared breathless

Toxic Symptoms

In eight of the 20 patients mild toxic symptoms were noted With one exception they appeared during the third, fourth, or fifth cigarette Three men complained of slight giddiness, three of nausea, and two of palpitation Two complained of præcordial pain, in one the pain was felt during the second cigarette, in the other during the fourth, and it disappeared five minutes after completing the fifth one The latter stated that smoking frequently produced this pain Case 7 with his fifth cigarette became pale and nauseated, almost vomiting The blood pressure was at once taken and the systolic B P was found to be 150 mm Hg and the diastolic 80 mm Hg The corresponding readings five minutes before had been 125 mm and 80 mm respectively

In a second case not included in the series because the observation were necessarily interrupted the subject became restless and giddy on completion of his first cigarette The radial tracing showed a gradual acceleration of rate from 80 to 145 and the pulse then became so small that it ceased to be recorded by the polygraph When the rate had reached 100 the systolic blood pressure was found to be 165 mm and the diastolic 90 mm, an increase of 30 mm and 10 mm respectively above the rate before smoking

CHART 3



Effect of posture and exertion on the average pulse-rate of 20 patients (D A H) and 10 controls (healthy men) before and after smoking (4-5 cigarettes) The vertical lines joining the upper pair of curves represent the change in rate ascribed to smoking

These two observations indicate that toxic symptoms from smoking may be accompanied by a *rise* in blood pressure (*Cf* Lee [6])

Of the *controls*, two showed toxic symptoms One began to feel warm after his fourth cigarette, then he perspired, grew pale, and finally vomited The other became somewhat pale after his fifth cigarette

Remarks

The object of our investigations upon smoking has been a restricted one, for we have attempted simply to determine the immediate effect of smoking a few cigarettes upon the circulatory system This effect has been ascertained in healthy men and in soldiers unduly breathless on exertion, and comparisons are drawn between them Instrumental methods were used whenever possible Sufficient preliminary observations formed a control for each individual, and during smoking numerous consecutive readings were taken Thus we have obtained a uniformity of result which suggests that the immediate pharmacological action of cigarette smoking, *as commonly practised*, is here correctly described

With the larger problem of the *later* effects of cigarette smoking indulged in for years we have *not* attempted to deal By its nature this subject abounds with difficulties, and a perusal of the literature only emphasises its complexity Yet it is perhaps allowable for us to make a few direct references to the question of smoking in the etiology of "soldier's heart" We are not of opinion that excessive smoking is the chief or, indeed, a frequent cause of this group of disabilities In this opinion we are supported by several facts—viz (1) An adequate cause for the disability is found in a large proportion Thus, a history of acute rheumatism is obtained in about 20 per cent of all cases of any severity [9] Frequently the trouble dates from dysentery, "trench fever," or other infection (Mackenzie [7]) (2) In about 50 per cent of all cases the symptoms have been present for several years, many have "always been short-winded"[12] The mere assertion that smoking has here been the ultimate cause would be futile (3) More than 20 examples of non smokers with identical symptoms and characteristics have been investigated at this hospital (4) There is no evidence, and we do not find from our case histories, that these patients, as a class, smoke more heavily than the average soldier

On the other hand, we are satisfied that as an accessory cause in the production or accentuation of the breathlessness and pain excessive smoking is of considerable importance The immediate pharmacological effect of smoking on the circulation of healthy men, habitual smokers, is shown to be not great, but definite enough, and in its direction unfavourable to effort In patients with "soldier's heart" who are unduly breathless on exertion this disadvantageous effect is rather more pronounced, especially when tested by exertion Many patients will admit that they experience præcordial distress or pain after over smoking, and this is confirmed, as we know, by inquiry among smokers in our own profession. The general opinion among athletes is undoubtedly against the use of tobacco when preparing for strenuous muscular exertion However incomplete our knowledge of the late effects of excessive smoking may be—most incomplete it is—we wish to say with Aikman, that "certainly we should hesitate to administer any drug having as marked an effect over such periods of time"

Summary

1 The immediate effect of cigarette smoking upon the circulatory system and upon the breathlessness of exertion was observed in 30 smokers, of whom 20 were cases of "soldier's heart" and 10 were healthy soldiers Each subject smoked either four or five cigarettes during a period of 40 minutes

2 A demonstrable effect was recorded in 17 of the 20 patients, the 3 unaffected were non inhalers Nine of the ten controls all inhalers, were influenced in the same fashion, though not to the same degree

3 The average pulse rate among the patients during smoking was nine beats higher than before smoking, in the healthy controls it was six higher Initial slowing of the heart was never observed, nor any irregularity referable to smoking

4 The rate of respiration in the patients was unaffected, in the controls it was slightly reduced

5 The average systolic blood pressure was raised by 5–10 mm Hg and the diastolic by 5 mm, both in patients and controls

6 These effects appeared within five minutes, with the first cigarette they almost reached the maximum, and this was maintained throughout the smoking period

7 A simple exertion test was performed before smoking and repeated on its cessation In the patients the pulse rate maintained a higher level throughout the test *after* smoking, and half of them were more breathless both subjectively and objectively In two patients præcordial pain was induced by smoking, apart from exertion But in the controls the pulse rate curve during exertion was much the same after smoking as before, and breathlessness was induced in two only

8 These observations show that, in health, the smoking of a single cigarette by an habitual smoker usually raises the pulse rate and blood pressure perceptibly, and these effects are a little more pronounced in cases of "soldier's heart" Moreover, the smoking of a few cigarettes can render healthy men more breathless on exertion, and manifestly *does* so in a large proportion of these patients

9 Excessive cigarette smoking is not the essential cause in most cases of "soldier's heart", but, in our opinion, it is an important contributory factor in the breathlessness and præcordial pain of many of them

HORSESHOE KIDNEY BY UNION OF THE UPPER POLES, DIAGNOSED PRIOR TO OPERATION

WITH CALCULUS IN LOWER POLE ON LEFT SIDE

BY DAVID NEWMAN, M D GLASG,
CONSULTING SURGEON GLASGOW ROYAL INFIRMARY

IT is remarkable that almost at the same time I should have under my care three cases, two in the Glasgow Royal Infirmary and one in a private nursing home, which stand alone in my experience, and, as far as I can ascertain, are unfamiliar to writers on the subject of urology Two cases are unique by reason of the lesions, the third on account of the coincidence of rare genital malformations in both husband and wife The cases are (1) Horseshoe kidney by fusion of the upper poles, diagnosed prior to operation for renal calculus, this case is described below (2) Complete retention of urine in a woman caused by a gumma surrounding the urethra and producing prolapse of urethral mucosa (3) Bilateral cryptorchism in a man and double uterus in his wife Of the first of these cases I give the clinical notes and an account of the operative treatment.

Fixed malpositions and malformations of the kidney are not merely pathological curiosities While on account of their rarity they are not of practical importance to the general practitioner, to the surgeon who desires to protect himself and his patient against catastrophes in the operating room an acquaintance with these abnormalities as well as with malpositions of the kidney is a necessity

Of the many malformations of the kidney, if we except congenital absence or atrophy of one kidney, the fusion of two kidneys, as met with in horseshoe kidney, sigmoid kidney, and disc shaped kidney, is the most important The amount of fusion that takes place between two kidneys varies greatly We may have the two organs united together across the vertebræ at their lower extremities by a narrow, thin, and flat isthmus, which may be formed of connective tissue only, or the union may be made up of a broad band of kidney parenchyma These are the lowest degrees of coalescence, from these we meet with all shades of fusion until we reach a condition where the two kidneys become completely incorporated so as to form either one disc-shaped organ, or an elongated body lodged on one side of the spine, the sigmoid kidney

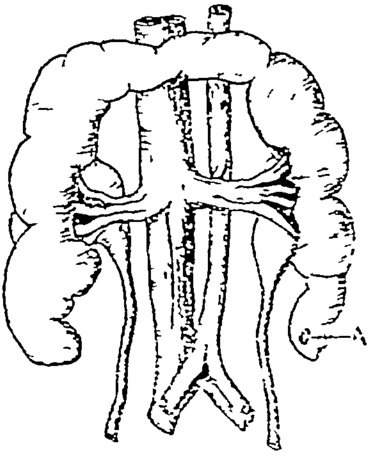
Horseshoe kidney is not only the lowest grade but also the most common form of fusion, and almost without exception it is the lower poles that are joined together, in a very few of the instances recorded the upper ends are united The present case is one of these, and it is the only one I can discover in which a pre-operative diagnosis was made In this respect it is unique Israel, however, diagnosed prior to operation a diseased horseshoe kidney of the more common form, and his diagnosis was confirmed This is the only other case of clinical diagnosis before operation, one which can be made only in exceptional circumstances and when the surgeon is on the outlook for the condition I may briefly state the history of the case as received from his medical attendant, Dr J D Walker, Camelon, Falkirk

> *The patient was never* "*strong*" and seven years ago (1909) he had an attack of orchitis associated with pyuria which confined him more or less to bed for five months, but ultimately he recovered sufficient

health to resume business and for a few years enjoyed comparatively good health although practically pus was never absent from the urine. His health was always best during the summer months In winter especially in very cold weather he suffered from pain in the right lumbar region, but it was never very severe until February 1915, when he had a very violent attack of pain in the right side, accompanied by an increase in the amount of pus in the urine difficulty in controlling the escape of urine, and vomiting which lasted for nearly a week Dr Walker says Since I have had him under observation there has no been anything else outstanding He complained always of the pain on the right side and sometimes I think there was pain on the left but this was not constant " In September 1916 he complained of pain while at stool between the rectum and the bladder but on examination per rectum nothing was discovered to account for the pain

Dr Walker tells me that Dr A. E Hunter of Falkirk had the urine repeatedly examined bacteriologically when it was heavily loaded with pus No tubercle bacilli were found. A coliform bacillus was present but he was unable to say definitely that it was the *Bacillus coli* A surgeon in Edinburgh was consulted and a cystoscopic examination made but as far as I can ascertain no definite opinion was arrived at All kinds of urinary antiseptics have been tried, I understand, but without success " Vaccine treatment also was employed (*B coli*) dose 30 to 50 millions "The difficulty everyone has had seems to be the site of origin of the pus Nothing definite was discovered

I was consulted at the end of October 1916, and sent the patient into the Regent Nursing Home He was a slender, thin man with feeble muscles and lax abdominal walls He complained of pain in the right lumbar region and frequency in micturition occasionally associated with bladder irritation, and he always noticed that the urine was cloudy and thick, especially in the morning With rest in bed the irritation subsided and the lumbar pain disappeared. Cystoscopic examination showed moderate congestion of the mucous membrane at the neck and in the trigone The right ureteral orifice was practically normal while the left showed distinct evidence of irritation the opening being dilated and the lips irregular and thickened The urine escaping from the right ureter was clear that from the left purulent The X rays showed an oval shadow the size of a horse bean close to the point of the left transverse process of the second lumbar vertebra, it was not movable on deep respiration



On palpation although the patient was very thin, the kidneys could not be felt in their normal position but when he was under an anæsthetic a horseshoe-shaped mass could be made out the bridge joining the kidneys being an inch and a half below the ensiform cartilage (see figure) Both limbs of the shoe were narrow bands and extended down to the level of the transverse processes of the second lumbar vertebra On pressure on the lower pole of the left kidney the patient complained of pain at a corresponding point on the right side

The diagnosis I made was calculous pyelitis in a horseshoe kidney the stone being located at the lower pole of the left kidney (A in figure) This diagnosis was confirmed by operation in which I was assisted by my house surgeons Mr J M Robertson and Mr Thomas R. Wilson The patient made a good recovery and was dismissed from the home in four weeks

Glasgow

Corrigendum.—Figs 1 and 2 of Dr J S B Stopford's article on Thermalgia (Causalgia) in last week's issue should be transposed Before operation analgesia was more extensive than anæsthesia a relation which was reversed by the operation

---

A CASE OF CLAUSTROPHOBIA

BY W H R RIVERS M D LOND, F R C P LOND, F R S,

TEMPORARY CAPTAIN R.A.M C MEDICAL OFFICER CRAIGLOCKHART WAR HOSPITAL, EDINBURGH

THE case I am about to record is that of a medical man aged 31, who from childhood has suffered from a dread of being in an enclosed space, and especially of being under conditions which would interfere with his speedy escape into the open

History of Patient

His first memory of this dread goes back to the time when at the age of 6 he slept with his elder brother in what is known in Scotland as a box-bed. The bed stood in a recess with doors which could be closed so as to give the appearance of a sitting room The child slept on the inner side of the bed next to the wall, and he still vividly remembers his fear and the desire to get out of bed, which he did not satisfy for fear of waking his brother He would lie in a state of terror, wondering if he would be able to get out if the need arose

His next memory bearing on his phobia is of being taken to see some men descending the shaft of a coal pit There came to him at once the fear that were he going down something might happen to prevent his getting out He remembers that whenever in childhood he was taken for a journey by train he dreaded the tunnels, and if by chance the train stopped in a tunnel he feared that there might be an accident and that he would not be able to get out This fear of tunnels became worse as he grew older When he began to go to the theatre or other crowded building he was always troubled unless he was near the door, and he was never happy unless he could see a clear and speedy mode of exit. He would never travel by the tube railway, and remembers his horror when on one occasion he had to do so As long as he can remember he has felt an intense sympathy whenever he has read of prisoners being confined in a narrow cell and he has always been greatly disturbed by tales of burial alive

He was always very nervous and excitable as a child and suffered from night terrors He has been liable, as long as he can remember, to worry without knowing why When about 12 years old he began to stammer, ascribing its onset to the imitation of a school fellow It soon passed off, but ever since he has been liable to stammer when out of health

During boyhood he had occasional attacks of sleeplessness, loss of appetite and inability to work. When about 22 years of age he decided to go in for medicine, and while reading for the Preliminary had an attack of this kind more severe than usual, which prevented his working for some time A similar attack during the second year of his medical studies made him fear that he would have to give up medicine, but the leisure of a vacation restored him, and he completed his medical course While serving as house surgeon he again broke down in health, but managed to finish his period of office and then did very light work for nine months

About six years ago while a medical student, he heard of a German, whom I will call A, who received patients into his house in order to cure them of stammering and other nervous ailments He stayed with him for two weeks, the treatment consisting mainly of a variety of suggestion in which the patients were told to relax their muscles and concentrate their minds on the qualities they desired to attain A. had recently become acquainted with the work of Freud, and had visited Vienna in order to learn something of his methods Some time later the patient again put himself under the care of A in order to undergo a course of psycho-analysis The analyst in this case does not appear to have been acquainted with the method of free association, and after an unsuccessful attempt to carry out a series of word associations the process of psycho-analysis resolved itself into an inquiry into dreams In company with others the patient was instructed about Freud and his views He was told that the cause of his trouble certainly lay in some forgotten experience of childhood of a sexual nature When he related his dreams they were invariably interpreted by means of symbolism of a sexual character Thus if he had dreamed of water he was told that this indicated a wish for sexual intercourse It is a striking feature of the process of examination and treatment to which the patient was subjected that it failed to discover the special dread of closed spaces from which he suffered At this time he had not realised that his dread was exceptional or was capable of treatment He had supposed that everyone objected to conditions which were so trying to himself, and it was only on account of his stammering and his general nervousness that he had sought treatment *Consequently* he told A. nothing about his dread and the process of analysis failed to detect it. Not only did the analysis lead the mind of the patient exclusively in a sexual direction, but it also failed to discover or remedy the claustrophobia

This process of so-called psycho-analysis had no result which satisfied the patient On the contrary, after two months of it his sleep became so disturbed and his general condition so much the worse that he gave up the treatment and returned home Nevertheless, he was left with the firm conviction, which he retained till he came under my care, that the root of his troubles lay in some forgotten sexual experience This belief was so strong that he continued to search out for himself some forgotten experience of this kind but without success, and shortly before the outbreak of the war he was thinking of going to Vienna to consult Freud and find whether the master himself might not succeed in discovering the lost memory

War Experience

The outbreak of the war interfered with this plan At that time the patient was still suffering from the effects of his breakdown when a house surgeon, but as soon as he had recovered sufficiently he joined the R A.M C and went to France When he reached the front he had to live and work in dug outs and was at once troubled by the dread of the limited space, and especially by the fear that he might not be able to get out if anything happened His dread was greatly stimulated on his first day in a dug out when, on asking the use of a spade and shovel, he was told that they were to be used in case he was buried It was only when he found others living and working in comfort in dug outs that for the first time he realised the exceptional nature of his dread and recognised that he was the subject of an abnormal condition After two attacks of trench fever his dread was greatly accentuated and increased to such an extent as to make his life almost unendurable He slept so badly that he had recourse to hypnotics and often spent a large part of the night walking about the trenches rather than remain in his dug-out His health became so impaired that he was advised by his commanding officer to consult the A D M S, who sent him into hospital He was there treated by rest and was given paraldehyde every night He was told to keep his thoughts from his war experience and to dwell exclusively on pleasant topics such as beautiful scenery

After three weeks in hospital in France he was sent to London where he was again treated by rest and hypnotics When he came under my care he had been sleeping very badly in spite of the hypnotics He had been having terrifying dreams of warfare from which he would awake sweating profusely and think that he was dying These dreams had become less frequent but still occurred He stammered very badly and was often depressed and restless He found it difficult to read anything which required a mental effort and complained that his memory was defective, especially for recent occurrences He had occasional frontal headache and suffered from pain and discomfort after food, which he ascribed to the paraldehyde he had taken, and he was liable to alternating constipation and diarrhœa His deep reflexes were somewhat exaggerated

In obtaining his history I learnt about his interest in Freud and about the previous attempts to remedy his condition by means of psycho analysis It was only when I explained to him my views concerning the exaggerated interest in sex shown by Freud and his disciples that he learnt for the first time that forgotten experience of other than a sexual kind might take a part in the production of nervous states It was agreed that "psycho-analysis" should be given a fresh trial from this point of view

Fresh Trial of Psycho analysis Memories Recalled

The next interview was devoted to a full inquiry into his previous experience in analysis, the results of which have already been given As a preliminary to the following sitting I asked him to remember as fully as possible any dreams he might have in the interval, and to record any memories which came into his mind while thinking over the dreams He was instructed to come to me at once if he had any dreams of interest A few days later he related a dream which I do not propose to consider here, because it does not directly concern the claustrophobia The interest of the dream from the present point of view is that in thinking over the dream there had come into his mind an incident going back to the age of 6 which had, so far as he knew, gone completely out of his mind for many years. Taking the dream and memory as a starting point, he was led on to recall two other incidents of this time, one of which seemed to be definitely related to the dream All three incidents had been completely forgotten till recalled on this occasion, though they were all associated with a strong emotional tone and had affected him greatly at the time None of them seemed to have any relation to the claustrophobia, but they were very useful in demonstrating to the patient the value of analysing dreams on a basis other than that of sex, and in showing him that the method, if persevered in, might lead to something more obviously related to his symptoms

Three nights later he had another dream As he lay in bed thinking over the dream, there came into his mind an incident dating back to 3 or 4 years of age which had so greatly affected him at the time that it now seemed to the patient almost incredible that it could ever have gone out of his mind, and yet it had so completely gone from his manifest memory that all his attempts at psycho-analysis, prolonged over years, had failed to resuscitate it The incident was of a kind which convinced him at once that the long sought memory had been found Unfortunately, his interest in the regained memory was so great that the dream which had suggested it was completely forgotten and all attempts to recall it were unavailing

The incident which he remembered was a visit to an old rag and bone merchant who lived near the house which his parents then occupied This old man was in the habit of giving boys a halfpenny when they took to him anything of value The child had found something and had taken it alone to the house of the old man He had been admitted through a dark narrow passage from which he entered the house by a turning about half way along the passage At the end of the passage was a brown spaniel. Having received his reward the child came out alone to find the door shut He was too small to open the door, and the dog at the other end of the passage began to growl The child was terrified His state of terror came back to him vividly as the incident returned to his mind after all the years of oblivion in which it had lain The influence which the incident made on his mind is shown by his recollection that ever afterwards he was afraid to pass the house of the old man, and if forced to do so always kept to the opposite side of the street

Ten days later the patient dreamed that he visited Edinburgh for the purpose of taking the Diploma in Psychological Medicine As he lay in bed thinking over his dream and its possible antecedents he found that he was saying to himself over and over again the name "McCann" He could not at first remember that he knew anyone so called, but it suddenly flashed on his mind that it was the name of the old rag and-bone merchant in whose house he had been terrified.

One thing was needed to make the story complete. It seemed possible that these thoughts recalled in consequence of thinking over dreams, might be purely fictitious It might be that in his intense desire to find some experience of childhood which would explain his dread the patient might have dreamed or thought of, purely imaginary incidents which had been mistaken for real memories Luckily the patient's parents are still alive and on inquiry from them it was learnt that an old rag and bone merchant had lived in the neighbourhood in such a house as the patient remembered and that his name was McCann Until they were told some 27 years later they had no idea that their child knew anything of the old man or had ever entered his house

Forgotten Experiences and their Revival

I propose first to consider this case in so far as it affords evidence concerning the forgetting of unpleasant experience and the possibility of recalling such experience to manifest memory It is well to distinguish this problem from the quite separate problems how far such forgotten experience acts as the basis of morbid states and how far the recalling of the forgotten experience to manifest consciousness is of value therapeutically

The main facts of the case from the first of these three points of view is that by following a certain procedure there came back to the patient a memory from early childhood which had, so far as he knew, been completely absent from his manifest consciousness for about 27 years It had been so completely forgotten that even six years devoted to research into his infantile memories had failed to recall it If it had not been for the independent confirmation of his parents the whole memory might have been dismissed as fictitious, but their evidence makes it clear that we have to do with the revival of a genuine memory

It will be well here to consider the conditions which led to the recovery of this long forgotten incident The facts that it should have eluded observation although diligently sought for six years, and that it should have come so readily to light at a later time, suggest that there was something faulty in the process by which the search had been conducted before the patient came under my care We may inquire why his previous attempts to discover the memory had failed when they succeeded so rapidly as soon as the subject was approached with a different method.

One cause of failure is undoubtedly to be found in the previous direction of the patient's thoughts exclusively in the direction of sex. He had been assured that the memory to be revived would certainly be concerned with sexual experience All his endeavours had been devoted to the end of finding such an experience We could hardly have a better example of the obstruction placed in the path of knowledge by the exclusive preoccupation of the Freudian school with the problem of sex In dealing with this subject on another occasion[1] I have dwelt on the part taken by the exaggerated, if not morbid interest in sex in producing the widespread prejudice against Freud's psychology which undoubtedly exists The case I now record shows that the evil goes much deeper, and that the exclusive interest in sex may actually obstruct the discovery of an infantile experience which furnishes as good an example as could be desired of unconscious experience and of the possibility of recalling it to manifest memory

A second, and perhaps more important, cause of failure is that until the patient came under my care his attention had not been especially directed to his claustrophobia It was only when he recognised that his fear of being in a dug out in France was not shared by others that he realised the specific character of his dread It was only when he came under my care that for the first time the process of analysis started from and centred round the dread of closed spaces Throughout all our conversations the attention of the patient was turned in this direction, thus leading the dream thoughts to occupy themselves with this topic until they reached and brought to the surface the memory which had lain dormant for 27 years The case well shows that the process of analysis by which forgotten experience is laid bare is not a loose method of examination which may start anywhere and be carried on anyhow but, if it is to be successful must be based on definite principles It must start from some special symptom or other experience, and must be conducted with a definite relation to the experience it is desired to reach

The previous failure of the patient to recover his infantile experience is to be explained partly by the exclusive direction of his interest in the direction of sex, partly by the process of examination and inquiry having failed to start from the dread of closed spaces to which the infantile experience has so obvious a relation A problem which remains for consideration is whether the later success was merely due to these two faults having been remedied or whether there was any positive virtue in the special method which was then employed This method is essentially that of free association as understood by Freud—the method of 'abstraction' of Morton Prince—but starting from the incidents of a dream and carried out during the time immediately following the dream In my own experience I have found this time especially favourable for the recovery of memories the state of half wakefulness seeming to be especially favourable to the freedom of association The employment of free association under these conditions must except under very special circumstances, be conducted in the main by the patient himself. The physician helps in the process by leading the waking thoughts of the patient in a direction calculated to awaken the desired experience, and he may also, as in the present case, help to elicit memories other than those which are recalled immediately after the dream, but the method is only suited to intelligent and well instructed patients

The procedure followed in this case differs widely from that in which dreams are usually employed by practitioners of psycho-analysis, who seem to use dreams chiefly as the means of obtaining clues to be investigated on other lines In the most recent exposition of the theory of psycho analysis[2] the value of dreams is rated very low, if, indeed their use is not altogether deprecated The success which has followed the special mode of utilising dreams now described, which has also attended other cases, suggests that Jung's condemnation of dreams is due to a failure to recognise certain ways in which they may be of use The interpretation of dreams has become in the hands of most of Freud's disciples a sphere in which free rein is given to the wildest speculations, and if this kind of process is carried into the clinical field it is not surprising that so relatively judicious a student as Jung should have been led to discount their value Here, as in every other of its aspects, the whole theory and practice of Freud and his disciples need thorough revision. When looked at from a new point of view, dreams may again take a prominent place among the means towards the recovery of a forgotten and repressed experience[3]

Relation of Forgotten Experiences to Pathological States

Thus far I have dealt only with the evidence provided by this case of claustrophobia in favour of the reality of unconscious experience and with the means by which it may again come to form part of the system of fully conscious memories I have now to consider how far this case supports the contention that the forgetting of such unconscious experience acts as the basis of pathological states In the case before us the pathological state is a definite example of a phobia. The problem for decision is whether the specific dread from which the patient has suffered for so many years is the direct product of the forgotten experience of his childhood. The whole character of the infantile experience is one well calculated to produce such a fear as that from which the patient has so long suffered The situation of a small child of 4 in a dark narrow passage with a strange growling dog as his sole companion is certainly one we might well expect to produce a lasting impression It is noteworthy that the infantile experience accounts for the special feature of the claustrophobia that it is not so much a closed space itself which the patient dreads but it is the fear that he may not be able to escape which especially haunts his mind The inability of the child of 4 to open the door leading him from darkness and danger into light and safety seems to have been perpetuated in the special character of the claustrophobia afflicting the man of 30 Throughout his life it has been when he sees no way of escape, whether at a distance from an exit in a tunnel, or tube railway, that the dread comes upon him, and when he went to France it was more especially the fear of being buried in his dug out which drove him to leave conditions usually regarded as those of comparative safety to wander in the more dangerous trenches. This close correspondence between the infantile experience and the dread of later life can leave little doubt that the two are definitely related to one another and that the infantile experience was the primary condition of the claustrophobia. It would seem probable that the phobia was accentuated and fixed later by his experience at the age of 6 when night after night he lay in the "box bed," fearing to show any signs of fear owing to the presence of his brother The process seems to have been one in which the great potentialities of an infantile impression were developed and fixed so that the emotional condition associated with the experience of the infant came to form part of the constitution of the boy and man It is possibly owing to this later experience that the dread which was to occupy and often master the mind of the patient for nearly 30 years had as its object the narrow space rather than the dog which was the more immediate cause of the child's terror So far as the patient remembers he has never had any fear of dogs, but it is *possible that there was a* period when the dread of the child was also directed *to the* animal, and that it was only the later and long continued terror at the age of 6 which transferred the dread so completely to the other chief element of the earlier experience

[2] C G Jung: The Theory of Psycho-analysis New York 1915, p 6.

[3] Since this was written I have found that the method used in this case agrees closely with that of Dr Meyer Solomon (Journ Abnorm Psych vol viii. 1913-14 p 73)

Theory of Repression and Active Forgetting

Another problem for consideration is how far his case supports Freud's *special theory of repression and active* forgetting What is needed here is some definite explanation of the process by which the acute and fully conscious terror of the child became converted into forgotten experience which was only restored to manifest consciousness after many years What can have been the nature of the process by which the fully conscious and vivid terror of the infant of 4 was converted into something unknown and unsuspected working in subterranean fashion to reproduce the state of dread or terror whenever the patient was exposed to conditions similar to those of his infantile experience? This topic belongs to the most difficult and obscure department of the subject In the case of adults there is reason to believe that the process of active forgetting or repression may in some cases take place more or less suddenly as the result of a shock or during a period of unconsciousness or delirium On the other hand, it may be the result of a long continued process of conscious or subconscious exclusion from attention It is difficult to imagine the latter kind of process taking place in a child of 4 or 5 It seems likely that it was the result of an illness in which the forgetting was assisted by some condition which produced an obvious modification of consciousness I therefore asked my patient to make inquiries into the history of his early illnesses He found that when between 2 and 3 years of age he had an attack of scarlet fever, so severe that the doctor despaired of his recovery Between 5 and 6 he had enteric fever, which does not seem to have been especially severe When about 6 or 7 years old he had an abscess in the shoulder which lasted some months Later he had pleurisy and was delirious, and there was again for a time little hope of his recovery This was followed by an abscess in the foot which took some months to heal The patient thus had a succession of severe illnesses both before and after the incident which seemed to have determined his claustrophobia The scarlet fever probably so weakened his health as to make him susceptible to dissociation or to enhance an innate susceptibility in this direction, while one of the later illnesses may have provided an opportunity for conditions which would assist the process of dissociation itself

Therapeutic Value of Recovery of Forgotten Experience

I have now considered how far we can accept this case as evidence for the reality of unconscious experience and for the view that such experience is the basis of the pathological state of claustrophobia There still remains the question how far the case supports the contention of Freud that the bringing of unconscious experience to light is of therapeutical value Two problems should be carefully distinguished It is one problem whether the restoration of a forgotten experience to manifest memory relieves nervous morbid states, and it is a different problem to discover through what processes the "cure" works

As regards the first problem, there is no doubt that the recovery of the forgotten experience of my patient had a great effect on his condition A few days after recalling the memory he sat without disturbance in the middle of a crowded picture house under conditions which for years before would have given him the most serious discomfort and dread The patient himself was so confident that he wished me to lock him in some subterranean chamber of the hospital, but I need hardly say that I declined to put him to any such heroic test He has since travelled in the tube railway with no discomfort whatever, so that the ordinary conditions which had brought his phobia into activity for many years no longer have this effect A striking sequel of the recovery of his infantile memory is that terrifying dreams of being unable to escape from enclosed spaces from which he formerly suffered now trouble him no longer, and he has recently had a dream, to be related elsewhere, in which he found himself in a narrow cell in the company of a bloodhound, and was amazed in the dream that he should be so happy and comfortable in this situation

The effect on the other symptoms from which he was suffering as the result of his war experience has been less satisfactory His stammering improved to some extent, and still more striking than any objective improvement was the disappearance of a dread of stammering which had been a constant source of trouble since coming home from France. He became able to take plenty of physical and mental exercise, but he continued to sleep badly and to be troubled by disturbing dreams of warfare. The continuance of these symptoms, however, is certainly due to the fact that though his claustrophobia had formed the starting point of his general war neurosis the neurosis is now kept going by other forms of anxiety

In connexion with his broken sleep and disturbing dreams of warfare one point may be considered In entering upon the line of treatment which I have described in this paper I hesitated whether I was justified in possibly adding to his other causes of loss of sleep by getting him to attend to and think over his dreams The progress of the case speedily removed any apprehensions of this kind. After his infantile memories had been discovered he continued to be interested in his dreams and their analysis, but did not find that the process interfered with his sleep Even while on the search for forgotten memories he did not attempt any analysis of that class of dream dealing with scenes of war, which especially disturbed his sleep

The Mechanism of Recovery

The last problem I have to consider is concerned with the agency by which the recovery of the lost memory has so greatly relieved the claustrophobia of the patient According to Freud and his disciples the raising of repressed experience to the surface is in itself sufficient to bring about the disappearance of morbid states, and they often cite this curative action as evidence in favour of the general theory of repression The case before us might well be regarded as striking evidence in favour of their view The recollection of the incident of his childhood has been followed by the disappearance of the dread which has been with him for so many years It might seem at first sight evident that this disappearance has been the direct result of the reintegration of the forgotten and dissociated experience with his ordinary personality Another possibility must, however, be considered

The whole procedure of psycho analysis is calculated to bring into play the agencies of faith and suggestion Thus the patient had been assured from his first attempt at psycho-analysis that the recovery of a forgotten experience of childhood would effect a cure It was evident when he came under my care that in spite of previous failure his mind was still dominated by the belief that if the right experienc could be found he would recover When the memory of th passage and the dog came back to him his mind was fille with a sense of comfort as regards his illness such as he ha not known for years

I did nothing to enhance his confidence in the Freudia interpretation of the process by which the recovery of a los memory produces a cure but in spite of my own scepticis concerning the mechanism of recovery, I was careful to sa nothing which would have disturbed his faith This fait was so great that it cannot be excluded as a factor in th therapeutical success of the revival of the forgotten experi ence His case has one feature, however, which suggests, it cannot be said to prove, that the recovery of the memor rather than the influence of faith and suggestion was th essential agent in producing the disappearance of his drea For years the patient had believed that the recovery of th right memory would cure his stammering and get rid of h general nervousness For reasons already considered, h faith had not had the state of claustrophobia as object Nevertheless, it was this symptom which was greatly relieved, though we cannot yet say that it has bee wholly cured The stammering and general nervousness, the other hand, which had throughout been the speci objects round which his faith was working, though alter for the good, have been relieved in far less degree Th argument is not conclusive, because the direction of th patient's attention towards his claustrophobia, which was essential element of my treatment, may have acted as instrument by means of which the agencies of faith an suggestion already working in the patient's mind were turn towards his claustrophobia.

PERFORATIONS OF STOMACH AND DUODENUM

BY JAMES TAYLOR, F R.C S EDIN ,
CAPTAIN R.A.M.C SURGICAL SPECIALIST CAMBRIDGE MILITARY HOSPITAL, ALDERSHOT

As I have had the privilege of being emergency surgeon in the central surgical military hospital of a large camp, most of the cases requiring immediate surgical attention have come under my care, and perhaps no group of cases has been of more interest than the gastric and duodenal perforations One might think that in a military camp one would get these cases sent into hospital early, so that the surgeon would have the best possible chance, but for various reasons this is not so, very many of the cases being admitted in the later stages of their illness after general peritonitis has developed. The condition in which one gets cases differs very little from that of civil practice We have had a good deal of trouble with chest complications, and I think this is due to the soldier, exposed to unaccustomed conditions, suffering much more from catarrh of the respiratory tract than civil patients usually do

The type of ulcer was usually the chronic variety with a great deal of induration around, and there was usually a definite history of gastric trouble over a long period The man entered the service with an ulcer, and this serious complication was no doubt precipitated by the impossibility of the sufferers avoiding the more indigestible articles in the Army dietary

As regards treatment, it has been carried out on the usual lines Most of the cases were drained. Very little time was spent over swabbing out the extravasated fluid, and only in one case, where the abdomen was simply full of thick food stuffs was any irrigation with saline attempted Where the perforation was in the region of the pylorus or duodenum, if the patient was in fair condition, a gastro-enterostomy was performed In closing the leak omentum was stitched over to supplement the invaginating sutures

Case of Duodenal Ulcer Prodromal Symptoms, Chest Involvement

The first case I mention is of interest on account of the prodromal symptoms of perforation and as exemplifying that chest involvement which I have mentioned.

Private W aged 27 was admitted complaining for the last few days of pain in the upper abdomen His pulse and temperature were normal and examination only showed some slight tenderness and resistance over the right upper rectus At 2 A.M the following morning he was seized with sudden severe pain in the epigastrium. He was seen by the orderly officer who ordered an enema This produced no result and I saw him two hours later He was pale suffering from considerable shock, and the abdomen was rigid and tender

The abdomen was opened through the right rectus A large perforation with marked induration round it was found on the right surface of the duodenum one inch beyond the pylorus There was much difficulty in getting the opening closed, and when this was done a posterior gastro-enterostomy was performed A tube was inserted into the pelvis through a small wound above the pubes Patient made an uneventful recovery as far as the abdomen was concerned The wound healed by first intention He had no pain or tenderness in the abdomen after the first few days

On the fourth day he began running a temperature which reached a maximum of 103·2° F on the eleventh day It gradually fell after this but on the fortieth day it was still 101° in the evening and showed a large daily fluctuation At the left base the percussion note was impaired The breath sound was tubular Sometimes it was distant and sometimes apparently quite superficial Pectoriloquy was distinct Repeated exploration of the pleura with a hollow needle gave a negative result X ray examination showed marked mottling and increase of density on whole of left side of chest These signs were most intense at the base Under an anæsthetic a needle was pushed through the diaphragm but only blood was obtained. Patient was sent to an auxiliary hospital and on his return from this three months after his perforation he still had a temperature and a very purulent spit A definite abscess was now localised in the base of the left lung A rib was resected and the cavity drained after which patient made a rapid recovery He was discharged from the Army but I have heard since that he is perfectly fit and able to work daily although there is a small sinus through which a slight discharge and a little air escape at times

Subphrenic Abscess

In three of the cases fluid in sufficient quantity to cause cardiac displacement appeared at one of the bases but in only one of the series did a definite subphrenic abscess develop In no case was there ever any sign of pelvic abscess The subphrenic abscess developed in a patient who had been perforated for 27 hours before operation and he was in addition somewhat up in years

Lieutenant Colonel C aged 47 who had spent many years in India had had dysentery and had also for many years suffered from severe pain in the right hypochondriac region (regarded as renal colic he had passed blood in his urine on one occasion) was sent to hospital with diagnosis of renal calculus. Patient had been ill for 25 hours. He was much collapsed. The abdomen was greatly distended and rigid all over A diagnosis of perforated duodenal ulcer was made and operation proceeded with.

The abdomen was found full of fluid. There was a considerable amount of peritonitis but not as much as one might have expected The ulcer a chronic one, was on the right surface of the duodenum Patient was so ill that very little could be done The aperture was closed a large tube inserted into the pelvis through a suprapubic wound and then the central incision stitched up The patient would not stand any swabbing out

During the first four days patient gradually improved Then his temperature and pulse began to go up and he became exceedingly tender under the right costal margin On the tenth day after operation there were signs of a definite abscess in this region An incision was made parallel with the intercostal nerves and a quantity of thin, foul smelling pus allowed to escape A drainage-tube was inserted. Patient was better for a few days but still the temperature did not drop to normal There were impaired percussion and diminished respiratory murmur at the right base with displacement of the heart to the left Exploring syringe showed a clear fluid in this pleura. On the twenty fifth day patient was again given an anæsthetic and through the old incision which was enlarged, two large drainage tubes were passed up between the liver and diaphragm into a right extra peritoneal subphrenic abscess. Patient gradually improved after this but the fluid at the base remained so long that it was necessary to aspirate it. He was discharged with a sinus still persisting under the costal margin This sinus is now soundly healed

Case of Pyloric Ulcer Operation, Gastro enterostomy a Week Later

Another case which I propose to describe shows how important a gastro-enterostomy is in many of these cases

Private G aged 49 was admitted 12 hours after perforating The pulse was very poor Operation was proceeded with at once The opening was found exactly over the pylorus so that it was impossible to avoid increasing the constriction that almost certainly existed. Patient was so ill and was taking his anæsthetic so badly that it was thought inadvisable to spend the extra time necessary to do a gastro enterostomy The pelvis was drained and the patient sent back to bed The case was further complicated by an impermeable urethral stricture

For two days patient went on very well Then vomiting began The stomach, which was found greatly distended, was washed out with a tube There was no more vomiting for two days but at the end of this time there was great gastric distension again, and patient began to bring up everything he took. A wash-out set him right but when it occurred a third time patient was becoming very weak, and it was obvious it was going to be impossible to feed him.

Under stovaine the abdomen was opened again A posterior gastro-enterostomy was done As the jejunum was much distended it was opened and several loops emptied the aperture being closed with a purse-string suture The abdomen was then stitched up Patient was very collapsed for a few hours but soon recovered By the use of eserine and pituitary extract the bowels were got moving and in a few days he was able to take light food.

He went on very well for 12 days, when he developed obstructive symptoms A Paul s tube was put into a distended loop but patient died *Post mortem* examination showed no mechanical obstruction. There was very little sign of peritonitis Patient seemed to have died of paralytic ileus

Mortality

Perforations of the stomach and duodenum are very serious surgical conditions Recovery apart from operation is exceedingly rare—put by some authorities at 5 per cent —and until recent years the death rate was exceedingly high even in cases operated on. The most important factor in the prognosis is the time that intervenes between perforation and operation The improvement in results is due partly to early recognition of the condition in a larger proportion of cases and partly to improvement in the technique

A collection of cases operated on by Mayo Robson, Finney, Moynihan, Christy Wilson, &c , showed the following result Total number, 486 , recovered, 227 , died, 259 Percentage recovery, 44 6

Sir Berkeley Moynihan in 1914 published the following table showing the effect of loss of time before operation —

	0–12 hrs.	12-24 hrs	24–36 hrs	36–48 hrs
Lived	36	9	6	1
Died	2	11	1	5

The results of the Edinburgh surgeons, Caird, Stiles, Miles, and several others between 1910 and 1913 were as follows Total number of cases, 80 , total recoveries, 53 , number of fatal cases, 27 Percentage death rate, 34 2

Duodenal perforations give a larger proportion of recoveries than gastric ones Mitchell, of Belfast, records a series of 16 cases of the former without a death

I had altogether 20 cases, and of these 5 died—death rate 25 per cent —but 2 of these deaths occurred about three weeks after the operation , 1 died of pneumonia on the twenty first day and the other, mentioned above, of ileus on the nineteenth day Of the other 3, 1 had been perforated for over 48 hours before operation Another, 24 hours perforated, lived a week and then perforated a second time A second operation was done but failed to save his life Rather more than half the cases were perforations of the stomach and there were four deaths in the gastric series as against one in the duodenal

There were two cases of second perforation—one, a fatal case, I have just mentioned, the other had been operated on four months before I saw him for a perforated ulcer He came under my care, suffering from symptoms of perforation again On opening the abdomen great matting was found round the pylorus and duodenum, with stomach contents leaking from among the adhesions It was impossible to define any definite opening The omentum was sutured over the area of the leak and a posterior gastro-enterostomy performed Patient made an excellent recovery

The Question of Primary Gastro enterostomy

There is considerable difference of opinion about the advisability of primary gastro-enterostomy, and this is a subject on which there will always be disagreement, for every case must be considered on its merits and no hard-and fast rule can be laid down, but the record of results of the various surgeons would rather indicate that in many cases the anastomosis should be done at once Against it Corner points out that a third of the cases are cured by suture only He thinks that the operation should be left to be done later, and it may be found that it will not be necessary to do it at all. The Edinburgh school are of opinion that omitting the operation has caused no bad result In this they are in agreement with Collinson, of Leeds, and Ellsworth Elliot On the other hand, Carwardine, in reporting 12 cases of perforation with 11 recoveries, says primary gastro enterostomy was done in three and these were all among the recoveries Mitchell, of Belfast, reports 28 cases of perforation of the duodenum with three deaths Seven of them, all recoveries, had gastro-enterostomy done Of the other cases one required the operation on the eighth day and another in 18 months, and other two of them had symptoms calling for the operation The case of Maylard and Andrews in which perforation took place on three successive occasions, with an interval of three and a half years between each, is another argument in favour of the operation

In my series primary gastro-enterostomy was done in six of the cases These were all recoveries and they ran altogether a happier course than the ones in which it was not done It might be said that the operation was done in the cases that were not very ill, and in which the prognosis was more favourable in any case In mine this was usually so, but not always In one of my cases the patient was an alcoholic of nearly 50 years, who had been perforated for 20 hours before operation So much narrowing was caused in suturing the ulcer that a new opening from the stomach was necessary If it is a perforation of a chronic ulcer in the region of the pylorus there is sure to be constriction, and with the additional narrowing caused by suture of the ulcer this constriction must be made worse In one of my cases I had to do a gastro-enterostomy at the end of a week, and in another one at least there were symptoms of pyloric stenosis afterwards Also, as I have mentioned already, one of my cases had been operated on for perforation previously In cases of ulcer on the lesser curvature or anywhere away from the pylorus suture cannot give rise to additional trouble, and as improvement after gastro-enterostomy is only expected in a third of the cases of simple ulceration it does not seem advisable in cases that have perforated to prolong the operation for such a doubtful chance of improvement

Prognosis

The case operated on longest after perforation was over 48 hours, that with recovery 27 hours The oldest patient was 63 years He made a good recovery

The life of most of these patients was saved, and most of them would be quite useful citizens afterwards, but I am afraid very few of them would be of much use to the Army, although many—in fact, most of them—returned to duty I fear, however, that a large proportion of them would have a recurrence of gastric symptoms and have to be discharged later It is difficult to render these men fit to take the Army diet I have noticed among cases that I have operated on for simple gastric or duodenal ulcer that although they were greatly improved and seemed perfectly well while they were in auxiliary hospitals, they relapsed a short time after their return to duty and ordinary fare It would take about a year of dieting to make these men right On the other hand, officers, who can have a certain choice of food, have made perfect recoveries after operation. and have been able to return to full duty in a comparatively short time

I am much indebted to Lieutenant-Colonel Wilson for permission to use the hospital records, and to Major Gordon Taylor for his kind advice and assistance

Reviews and Notices of Books.

Health and the State By WILLIAM A. BREND, M A. Camb, M D (State Medicine), B Sc Lond, of the Inner Temple, Barrister at-Law, Lecturer on Forensic Medicine, Charing Cross Hospital London Constable and Co 1917 Pp 354 Price *10s 6d* net

GREAT efforts have been made by Parliament in recent years, upon the initiation and advice of responsible Ministers, members of various Governments, to improve the health of the community at the charge of the State Dr Brend has set himself the task of pointing out methodically, and with the support of established facts and statistics, that the value of these efforts has been unduly small, that grave mistakes have been made, and that money has been spent with disproportionate results He asserts that there has been a general failure to achieve success, and attributes it to the means adopted to initiate and carry out reforms and to the system by which legislation is introduced by a Minister who may not himself be master of his subject and who, for all that Parliament and the country knows, may not even be following the advice of the departmental experts supposed to be behind him

The administration of the laws relating to the public health is a very complicated business, entrusted to a large number of public authorities who are not coördinated, and whose duties overlap at some points and at others leave important sections of the ground untouched, of this the medical profession, or those members of it who are brought into contact with public health questions, are fully aware, and these should be interested in Dr Brend's exposition of the facts and deductions therefrom Much more so, however, should his book be read by those members of the legislature who treat all Bills before Parliament as political measures, to be voted upon in strict conformity to party lines of action, or those who believe that on matters where experts agree amateurs may tender valuable advice, although no amateur need devote any study to the questions In supporting the formation of a Ministry of Health to investigate the causes and distribution of disease and to evolve suitable measures for local authorities to carry out, Dr Brend examines the various causes which lead to disease and loss of life, and describes the measures adopted hitherto in order to show the nature of the errors which, in his view, lead to misdirection of energy and useless expenditure Here he enunciates opinions which themselves may attract criticism from his medical colleagues and the discussion of which may prove extremely useful He gives prominence, for example, to the question whether the infectious nature of various diseases and the importance of segregation as a preventive of the spread of some illnesses may not be exaggerated, and he makes the same suggestion of exaggeration with regard to the view that infant mortality is largely a result of pre natal conditions or maternal ignorance and neglect His object here is to emphasise the greater urgency of the removal of those post-natal factors contributing to destroy infant life, but over which parents in the humbler classes of society have no control, obliged as they are by the circumstances of industry to live in crowded areas. In criticising the National Insurance Act, Dr Brend describes it as the most ambitious piece of public health legislation ever carried through in the country, and says "No previous measure has directly affected so large a number of persons, involved so great a cost, made such demands upon administration, or been introduced with such lavish promises of benefit to follow, and no previous measure has ever failed so signally in its primary object", and he severely condemns the holding out of alleged successful national insurance in Germany as justifying the introduction of legislation upon similar lines here As will be seen, there is a tendency here to beg the question of what was the "primary object" of National Insurance in the mind of the statesman mainly responsible for it and of his followers Such a minister might reply by suggesting that legislation is largely a matter of politics and of feeling the way for desired reform along lines of least resistance

When the National Insurance Act was introduced with picturesque oratorical descriptions of future benefits to accrue directly from it, reforms in land tenure, housing and conditions of labour might have been attempted, but might have failed to secure the approval of Parliament These, however, have probably been advanced several stages upon their road to fulfilment by the knowledge of disease affecting the working classes and of the failure of extended medical treatment to cope with it, as well as by the general stimulating of national interest in disease and its problems In this connexion criticism such as that levelled at National Insurance by Dr Brend, iconoclastic as it may appear to some, may be of very definite usefulness in paving the way to more general and far reaching efforts in the interest of the public health But it seems almost impossible that such a consummation will be attained without a general effort on the part of legislators, and, it should be added, of their constituents, to study and to understand the nature of the problems involved before attempting to formulate solutions for them This comprehension of what is required is all the more needed on account of the demands which legislation such as that suggested is likely to make upon private interests, and the multiplicity of the interests certain to be involved

Clinical Surgical Diagnosis for Students and Practitioners By F DE QUERVAIN, Professor of Surgery at the University of Basle. Second English edition Translated from the Fifth Edition by J SNOWMAN, M D London John Bale Sons, and Danielsson Pp 841 Price 35*s* net

IN reviewing the fourth German edition of this book four years ago we expressed the opinion that there was no published work on diagnosis likely to give greater help to the student, qualified or unqualified, in view of the clear statement in the text of the essential points of diagnosis and the abundance of well chosen illustrations It is therefore with special pleasure that we welcome a new English edition of the book, prepared by Dr Snowman from a fifth edition, in which Professor de Quervain had re-written the sections on stomach and duodenum, added nearly 100 new illustrations, and incorporated his recent experience in the diagnosis of the conditions special to war surgery The translation has been well done, and conveys the freshness and originality of the Swiss school of surgery, of which, now Kocher is gone, de Quervain is the most distinguished living exponent

Psychological Medicine By MAURICE CRAIG, M D Cantab, F R C P Lond London J and A. Churchill. 1917 Third edition Pp 484 Price 15*s* net

THE third edition of Dr Craig's well known manual has been enriched by additions on the subjects of the psycho neuroses occurring in men exposed to shell shock and strain of war, psycho-analysis, and the Mental Deficiency Act of 1913 The first-mentioned and urgently pressing subject is well summarised The symptoms of the effects of the various stresses of war are well recognised in these days, and do not turn out to be materially different from the symptoms of the traumatic neuroses, psycho-neuroses and psychoses of other origin, but the problems of diagnosis and treatment remain and are urgent in proportion to the huge number of patients affected The differentiation between the varieties of neuroses and psychoses, the limits to be assigned to the responsibility of patients in conscious and unconscious exaggeration and simulation of symptoms and the more exact determination of subtle organic lesions are factors of the hardest problems, academic and practical How are we to determine if a given symptom is of organic or functional origin or the result of weak or perverted volition? To such questions rough and ready or *ex cathedra* answers too often lead to therapeutic disaster Much uncured nervous or mental disorder is invalided out of the Army and the question at once arises whether this is due to therapeutic impotence or to the treatment of organic cases as functional and of functional cases as organic or to the failure of the diagnosis of exaggeration and simulation conscious or unconscious and the consequent neglect of the application of appropriate measures

Dr Craig is not much impressed with the value of psycho-analysis in the treatment of nervous affections due to the war but it must nevertheless remain true that it is only by psychological analysis that problems of psychic abnormality can be solved It is perhaps owing to the somewhat materialistic point of view of modern medicine that the results of treatment of abnormal psychic states are disappointing, and that so much of the successful treatment of such states lies to the credit of various sorts of charlatans With the elimination of the more extreme sexual hypotheses of the psycho analytic school and with an increase in width of their view we may hope for the solution of some of our difficulties in the determination of the validity of certain varieties of functional symptoms, whether somatic or psychic In the meanwhile, a combination of physio- and psycho therapy, as the author points out, appears to lead to the best results Unfortunately, the psycho therapeutist is born to his *métier*, and the difficulty of manufacturing him results in his being a scarce article Dr Craig's abstract of the Mental Deficiency Act will be found useful when, after the war, its provisions become more widely operative

With the additions enumerated and verbal emendations here and there the book will, we are sure, continue to prove its usefulness as a manual for students and practitioners

JOURNALS

The Quarterly Journal of Medicine Edited by WILLIAM OSLER, J ROSE BRADFORD, A. E GARROD, R HUTCHISON, H D ROLLESTON, and W HALE WHITE. Vol X., No 39 April, 1917 Oxford At the Clarendon Press London Edinburgh, New York, Toronto, and Melbourne Humphrey Milford Subscription price, 25*s* per annum Single numbers 8*s* 6*d* net each —The contents of this number are 1. Some Actions of Anæsthetics Analysed by the Observation of Altered Cardiac Relations to Calcium, by W Burridge In a previous paper by the same author the view was expressed that anæsthesia is a state in which the body calcium has to work at a disadvantage The experiments now recorded seem to establish the existence of a twofold action of anæsthetics on the heart—namely, a depressing action, which is reached quickly on addition of the drug to the perfusing solution, disappearing directly after its removal, and a favouring action which shows a time factor in its appearance, and especially in its disappearance Certain observations are also recorded upon the effects of too low calcium tension of the blood and the risks which it entails in anæsthesia, and the suggestion is made that this condition may account, in part at any rate, for the risk associated with anæsthesia in the subject of chronic alcoholism or hyperthyroidism 2 Researches on the Perfused Heart An Action of Strychnine, &c, with Some Remarks on Tetanus, by W Burridge This contains the record of observations made on similar lines to those recorded in the first paper A certain action is described as produced by strychnine atropin and ergotoxin in a certain type of abnormal heart and the conclusion is drawn that the particular effect produced by these drugs follows on their ability to cause a degree of relative calcification of the tissues The effects of the perfusion of solutions of relatively high calcium tension are considered, and are described as varying from the change of inhibition into excitation to the induction of tonic contraction 3 Researches on the Perfused Heart. Some Actions of Adrenin, together with Some Remarks on Addison's Disease, by W Burridge Adrenin is found to have a twofold action on the frog's heart—a primary depressing action resembling inhibition and an augmenting effect, the sympatheticomimetic action The relations between adrenin and calcium and the "balance" of the inorganic constituents of the blood or perfusing solutions are also studied, and on the basis of the results obtained it is suggested that the proportions of the inorganic constituents of blood are such as to render it an unsuitable medium for the manifestation of cardiac activity except in the presence of adrenin The origin of certain symptoms of Addison's disease is traced to such lack of balance 4 Pathology of Dysentery in the Mediterranean Expeditionary Force, 1915, by G B Bartlett. One of the general conclusions arrived at in this important paper is that the epidemic of dysentery among the troops upon the Gallipoli peninsula was due to amœbic infection In the examination of 477 stools of dysenteric appearance vegetative amœbæ of pathogenic type were found in 379 or 79 4 per cent., while at the post-mortem examination of 61 cases of dysenteric ulceration of the intestines amœbic lesions were found in 56, or 91 8 per cent Amœbic infection was more prevalent on the peninsula than the symptoms and signs in the hospital indicated, since on the routine examination of 652 stools not dysenteric in appearance vegetative amœbæ of pathogenic type were found in 118, or 18 per cent The epidemic of amœbic dysentery was accompanied by an epidemic of enteric fever, lesions of enteric being found in 41 of 142 complete necropsies, or 28 8 per cent The routine treatment adopted was that recommended by Sir Ronald Ross—viz , injection of emetine hydrochloride, administration of saline purgatives and bismuth mixture—and it was successful in curing amœbiasis in the majority of the cases. It is further of importance that the routine treatment in amœbic dysentery should be designed to combat bacterial infection of the intestines as well as to eliminate amœbiasis 5 Diabetes Innocens, by George Graham An interesting résumé, with a record of some cases showing that an innocent form of glycosuria occurs which is not associated with renal disease, and that it occurs in two types In one, the output of sugar is very small and is not appreciably altered by a dose of sugar, in the second, the output of sugar is greater and is increased to a certain extent by a dose of sugar

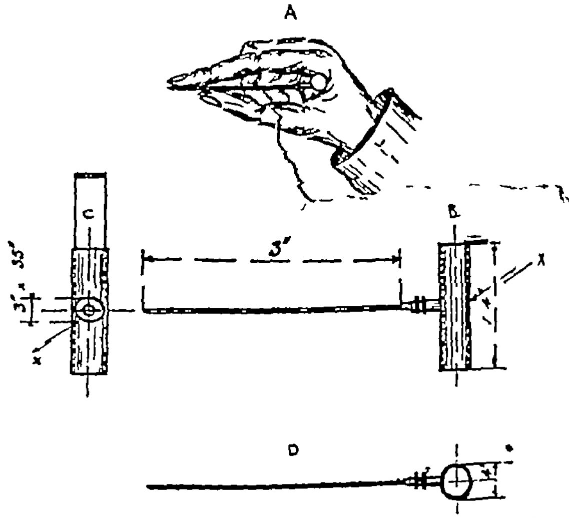
Brain A Journal of Neurology Vol XXXIX Parts III and IV , and Vol XL , Part I —Parts III and IV of Vol XXXIX are in one volume and comprise a series of very important papers Among these is Professor W D Halliburton's suggestive address as president of the Neurological Section of the Royal Society of Medicine on ' The Possible Functions of the Cerebro Spinal Fluid." Dr E G Fearnsides contributes an interesting and exhaustive article on intracranial aneurysms—a study of cases found post mortem at the London Hospital between 1907 and 1913, 44 cases out of 5432 necropsies in which examination of the head was permitted It would seem from the evidence afforded by these cases that syphilis is a very rare cause of intracranial aneurysm, and that the cases form two groups one associated with inflammatory conditions—e g , infective endocarditis—and one with arterial or cardio-vascular degeneration Dr Ffrangcon Roberts deals with the degeneration of muscles following nerve injury, and Dr Graham Brown and Dr R M Stewart contribute a paper on the recovery of power of localising and discriminating sensations in cases of cerebral lesions Mr E W Scripture gives graphic records of speech in cases of disseminated sclerosis which he claims to be helpful in the early diagnosis, and Dr J McIntosh and Dr P Fildes describe their experiments which endeavour to determine the factors which govern the penetration of arsenic and aniline dyes into the brain, and their bearing upon the treatment of cerebral syphilis —In Vol XL , Part I , Dr David Orr and Major R G Rows continue their researches into experimental toxi infection of the nervous system—the present paper dealing with the process as it affects the brain The second paper is by Dr George Riddoch on " Dissociation of Visual Perceptions due to Occipital Injuries with Special Reference to Appreciation of Movement," and is a valuable study of the material he has had at his disposal in the Knutsford Hospitals The third article is one by Dr Ramsay Hunt (New York) on " Progressive Atrophy of the Globus Pallidus," an article which goes far to support his contention that the juvenile form of paralysis agitans has as its pathological basis degenerative changes in the cells of that structure It is even suggestive that such changes may underlie ordinary cases of paralysis agitans, and it brings these into relationship with the cases described by Wilson of chronic lenticular degeneration

New Inventions.

A MODIFICATION OF A NEEDLE FOR LUMBAR PUNCTURE IN SYPHILIS

WHEN in a case of syphilis it is desired to obtain a sample of cerebro-spinal fluid for testing purposes, Professor Jeanselme, of the Broca Hospital, Paris, uses a platinum iridium needle three inches long and of a very fine calibre (outside diameter measuring 57 by Sturrett gauge) The fineness and flexibility of this needle make the operation of lumbar puncture practically painless, but the absence of a handle renders its manipulation a little difficult I find this can be overcome by fixing to the shoulder of the needle a hollow cylinder, open at both ends and with a window cut in its middle, as shown in the illustration The lumbar puncture is carried out as follows

The patient is placed sitting on a stool with elbows resting on knees, head bent down, and lumbar region thrust well out If confined to bed he should be on his side with knees and shoulders brought close together and the lumbar region arched out as much as possible A rubber tubing is stretched between the highest points of the iliac crests, and a mark made with an indelible pencil on each side of the spinal column This gives the upper border of the fourth lumbar spine The skin is now sterilised with absolute alcohol and anæsthetised by spraying with ethyl chloride. The needle, previously sterilised and dipped in sterile olive oil, is held in the right hand (see Figure, A) Then with the forefinger of the left hand feel for the most prominent spine at the level of the marks made with the indelible pencil, it is not always below the line drawn and may be either on the line or slightly above it Insert the needle in the middle line just beneath the finger with a sudden sharp jab, so as to go through the superficial structures, push the needle onwards until the dura mater is pierced The sensation imparted to the finger as the needle punctures the dura mater is quite characteristic. By keeping the eye fixed on the window (marked " x " in illustration) one can see when fluid begins to flow (In some cases the cerebro-spinal fluid is at such pressure that it spurts through the window If this happens the shutter can be lowered) A sterile test-tube is then placed under one end of the cylinder handle, the fluid flows down the inside of the cylinder and directly into the test-tube None can run back along the outside of the needle and down the patient's back, as often happens when using the ordinary lumbar puncture needle Sometimes the fluid flows better by rotating the needle This can be done without interfering with the outflow, as the cylinder handle is open at both ends



Platinum iridium lumbar puncture needle. B Side view of needle with handle annexed showing little window or opening and shutter marked " x " C, Top view of handle giving full view of window and shutter " x." D View of needle and handle placed horizontally so as to show hollow cylinder handle

If it is desired to administer intrathecal injection after the withdrawal of the cerebro-spinal fluid a syringe or rubber tubing can be attached to the needle through the window ("x") in handle

Having withdrawn the required amount of cerebro-spinal fluid the needle is removed, a collodion dressing applied, and the patient immediately put lying down on his stomach on the operating table or on a sofa for about 15 minutes He is then allowed to walk back to his ward, being instructed to go straight to bed and remain lying on his stomach for a few hours

I have used the above needle for some time and find that lumbar punctures performed as above are practically painless and are rarely followed by any headache or bad after effects The needle handle shown was made under my direction by Sergeant G T Platford, R A M C , from an empty cartridge case The complete instrument is now made by the Holborn Surgical Instrument Company, and the price is 25s

CHARLES F WHITE,
Major R.A.M C

PERSODINE

(LUMIERE)

Active, Tonic and Digestive Stimulant

PERSODINE is composed principally of pure alkaline persulphates, specially prepared to form a stable compound

Persodine (Lumiere) has made it possible to utilise the very powerful oxidising properties of the alkaline persulphates

It possesses undoubted tonic digestive properties, is well tolerated, and has a marked action on the nutrition, as is shown by increased body weight

***INDICATIONS*:**

ANOREXIA
CHLORO-ANÆMIA
RICKETS
CONVALESCENCE, &c
TUBERCULOSIS
NEURASTHENIA
DYSPEPSIA

URASEPTINE

The Most Powerful and Effective Urinary Antiseptic.

URASEPTINE is a granulated product entirely soluble in water, its bases being **Piperazine, Urotropine, Helmitol, Benzoates of Sodium and Lithium** It contains 60 centigrams (10 grs) of active matter to each teaspoonful

DOSE —2 to 6 teaspoonfuls daily

It purifies the Urine, and this action is due to its three principal properties

1. It is a URINARY ANTISEPTIC.
2. A SOLVENT of URIC ACID and of PHOSPHATES
3. A MILD NON-TOXIC DIURETIC.

INDICATIONS—**Arthritism, Gout, Gravel, Hepatic and Renal Colic, Rheumatism, Calculus, &c, Phosphaturia, Urinary Antisepsis, Pyelitis, Bacteriuria, Cystitis, Prostatitis, Urethritis, Pyuria, Urinary Abscess, Vesical Catarrh, &c**

The SCIENTIFIC TREATMENT of HAY FEVER and allied ailments

KINECTINE

According to Dr MOUNEYRAT, the discoverer of Galyl and Hectine (the widely adopted Salvarsan Substitutes)

FORMULA

Chlorhydrate of Quinine c Hectine—i e, *Benzo sulfone para-amino-phenyl arsenate of Quinine*

Non toxic, produces no ill-effects

Easily taken (tablets) and well tolerated

Highly satisfactory clinical results —

NOT ONLY A PROPHYLACTIC AGAINST, BUT A SPECIFIC IN, HAY FEVER, CORYZA, INFLUENZA, MALARIA, &c.

RAPID ABORTIVE ACTION IN THE INITIAL STAGES, &c

CURATIVE ACTION IN THE ADVANCED AND CHRONIC CONDITIONS

Sir,—I [illegible] H M S —— July 27 1917 [illegible] The drug has [illegible] (Surgeon R.N.)

Medical Treatment of CANCER.

CUPRASE

Cuprase is a colloidal Copper hydroxide which is obtained chemically by the reduction of Salts of Copper in the presence of Albumosic Acid

This treatment has passed far beyond the experimental stage The numerous clinical reports from Doctors of repute in various countries give cases of a great variety In all of these pain has been eliminated, and in a good percentage cures are claimed, and in no instance any undesirable effects

Extract from Proceedings of the Royal Society of Medicine February 1913

Dr George Herschell comparing electric and chemical colloid copper stated "Chemical colloid appears to give the best results In the following cases chemically prepared colloid was used. Experimentally it has been proved: (1) That particles of colloid copper can be demonstrated in the granulations of cancerous growths after two or three injections of the colloid and clinically (2) There is invariably great relief from pain (3) Appetite and strength return and the patient puts on flesh; (4) There is in many cases a diminution in the size of the tumour (5) The injections are absolutely non-toxic, although in many cases an inflammatory reaction is manifested in the cancerous growths.

As regards my own personal experience in the use of this method of treatment in addition to my own cases I have had an opportunity of observing the effects in the practice of some of my medical friends and in nearly all cases the progress of the disease appeared to be arrested."

"SANITAS"

"SANITAS FLUID" contains a large proportion of Peroxide of Hydrogen combined with several antiseptic and germicidal substances.
NON-POISONOUS DISINFECTANT for Washing the Sick, Dressing Wounds, Mouth and Throat Wash, Purifying the Air by Oxygenation, and Spraying Sick Rooms. 8d. and 1/3 Bottles, and 6/- per Gallon (Sprays 3/6 each.)

"SANITAS OIL," for Inhalations in Lung and Throat Trouble

"SANITAS JELLY," a useful Antiseptic Dressing for Wounds and Ulcers.

"SANITAS-SYPOL"—an improved **LYSOL** (introduced by us in 1902).
Makes a Clear Solution for Antiseptic Surgery.

"SANITAS-OKOL" (EMULSION)
"SANITAS-BACTOX" (HOMOGENEOUS)
Phenoloid Disinfectants from 18 to 20 times the co-efficiency of Pure Carbolic Acid.

"SANITAS POWDER," for Dry Disinfection—much stronger than Carbolic Powders.

"SANITAS SOAPS," Hard, Soft, Toilet and Animal.

"SANITAS SULPHUR CANDLES" (Kingzett's Patents), for Fumigation.

"SANITAS FORMIGATORS" (Kingzett's Patents), for Formic Fumigation.

"SANITAS POLISHES" (DISINFECTANT), for Floors and Furniture and for Hospitals, Workhouses, &c

"PEROXIDE OF HYDROGEN" (Kingzett's Preserved Quality)

The "SANITAS" CO., Ltd.,
LIMEHOUSE, LONDON, E 14.
Disinfectant Manufacturers, by Appointment, to H M THE KING.

Education, War, and Progress

WAR is the great opponent of the progress of civilisation and a prime deterrent of educational schemes This truism was found on all lips as soon as it became apparent that the war must last for a long time, being employed as an argument alternatively for the immediate suspension of everything except fighting, and for the immediate suspension of fighting But the truism has been examined more closely as the recent months and even years were rolling by, when it became possible to note that in certain directions sociological advances were being originated by, or growing up with, the conduct of the war And the spirit with which the country, as well as the legislature, has received the proposals of the Education Bill, which was introduced last week in the House of Commons, is a proof that we are all resolved that the end of the war shall not find us as a nation to have lapsed far from our former grace—nay, we may hope to see, on the day when peace dawns, signs that we are more ready to seek for better things Mr FISHER justified the introduction of a measure of far reaching social importance in the height of a great European war because, among other things, the provisions of the new Education Bill are connected with the circumstances of the war, and when he warned the House of Commons, in an advance defence of his more revolutionary proposals, that we had reached a point in history where we must take long views, he was saying in so many words that the war has enabled us to see much in proper perspective that had been a muddle to the self satisfied vision of peaceful security He reminded us that we have incurred the hostility of a nation larger in population than our own, and with a larger extent of concentrated territory, and that no one need count upon German sentiments changing after the war, it followed that it was necessary for the youth of our country to be given the best educational opportunities which ingenuity can devise, so that the coming generation may hold its own in the gigantic international combat of brains and endeavour

The new Bill is founded upon Mr BALFOUR'S Act of 1902 It is a development of that thoroughly sound, though much discussed, piece of legislation, and we trust that it will be carried into law much in the shape of its original provisions For it is a charter of salvation for our youth of both sexes There can be no doubt whatever that the best educated countries will be the ones that will most quickly recover from the effects of the war, while the benefits of education can only be adequately obtained by those in a sound physical state Every educational scheme which tends to impair that state by so much fails in its educative purpose, and every scheme which does not aim to improve that state is a want of that long vision which Mr FISHER demands The main proposals of the New Education Bill may be summarised as follows They aim to improve generally administrative organisation by the consolidation of school grants, and by any other measure of reform suggested by an effective survey of the educational machinery of the country, to secure that every boy and girl of elementary school life up to the age of 14 shall be sheltered from industrial work, to establish part-time day schools at which attendance shall be compulsory, and to develop higher elementary education while making the improved physical conditions of the children a first care In many places this programme is of distinctly medical interest apart from the general interest which medicine must always take in the work of social reform. We endorse cordially, for example, the intention to enforce the prohibition of the employment of children under the age of 12 and to secure that those under the age of 14 shall pursue their studies uninterrupted by the competing claims of industry There is no doubt that all earning of wages under 14 is open to grievous abuses It may be quite true that in certain districts of the country where part time employment is recognised the physical standard of the children does not seem to be unduly low, but, if it be true, it can only prove that the system as at present worked is in the hands of considerate and intelligent employers The organisation under which continuation schools are to be set up by the Bill reveals a very proper and adequate appreciation of the circumstances in which alone such schools can be of any service It is proposed that, with certain exceptions to be defined under the Bill, any person no longer under obligation to attend a public elementary school shall attend such continuation school as the local educational authority of the area in which he or she resides may require for a period of 320 hours in the year—that is, eight hours a week for 40 weeks And we rejoice to see that the Bill provides that the part time which is to be given up to continuation study will be taken out of the employers time, precaution being also observed that the students have not to work unduly long hours during the days on which the classes are held, and are given a reasonable interval for food, rest, and washing between leaving the workshop and attending the continuation school

Mr FISHER is to be warmly congratulated on his Bill, and we hope that it will not be long before the measure, without drastic modifications, finds a place on the Statute book The general health of our State school population is not good, though strenuous exertions on the part of school medical officers have maintained it without deterioration during the war We are sure that the splendid efforts made by the school medical service will take more speedy effect under a reformed legislation Physical training is already recognised in our elementary State school education, but few educational medical officers can feel that they have at their disposal any systematic scheme for the physical betterment of their charges The new Bill gives physical training a place in the activities of the continuation schools, while it empowers local education authorities to establish nursery schools and to maintain playing fields and swimming baths Medical inspection will take on a new meaning when such opportunities for physical well being are brought within the reach of the young of both sexes The Bill is a piece of enlightened hygiene Money will have to be spent with both hands to ensure its promises being realised, and the truest economy will be served in the spending

◆

The Administrative Control of Tuberculosis

WE have the tuberculous, as we have the poor, always with us, and their origin has much in common Administrators have long been accustomed to look on the incidence of tuberculosis and the statistics of infant mortality as indices of the success of social medicine in a community For many years we have noted with some complacency a steady reduction in the death rate of both, although in diminishing ratio, to which pleasant feeling of security the figures for 1915 put an end with something of a rude shock In that year 41,676 deaths were returned under headings 28 and 29 of the international list of causes of death, which include "phthisis" and pulmonary tuberculosis, amounting to 7 4 per cent of the death rate from all causes In almost every age group among females as well as among males the mortality was markedly higher for 1915 than for the average of the five previous years The figures for tuberculous meningitis showed the same increased incidence These and other similar facts give occasion for a renewed inspection of the means applied in this country to control tuberculosis, and it is instructive to note that at the end of the first quarter of the current year only 269 sanatorium beds and 69 hospital beds were occupied by insured persons suffering from tuberculosis under the care of the Insurance Committee of the County of London, while during many months of the year 1916 the number on the waiting list exceeded the number of those under institutional treatment The London Insurance Committee was unanimous in finding the provision for tuberculosis in the county, and especially the financial provision, to be inadequate, and in bringing the situation very forcibly to the notice of the Commissioners Going further afield, a dramatic picture of the incidence of tuberculosis in France has been recently drawn by Dr HERMANN M BIGGS, the State Commissioner of Health for New York, who was sent, at the suggestion of the French Government, by the Rockefeller Foundation to consider the problem of tuberculosis in the French armies Dr BIGGS found that there had been a great increase in the prevalence of tuberculosis in all the armies of the belligerent countries, excepting only England He estimated that if the war were to end now there would be approaching half a million cases of tuberculosis to be cared for, with practically no facilities in France to deal with them At the end of this year France may have some 15,000 beds at the disposal of tuberculous patients, in addition to half a dozen well organised dispensaries, and a handful of physicians conversant with the tuberculosis problem, but with no trained nurses or special social workers The figure takes note of the new hospital annexes, to which our Paris Correspondent calls attention this week This is an improvement on affairs at the beginning of the war when there were only some 1000 sanatorium beds in the whole of France, and these in private institutions Hospitals then received tuberculous cases into their general wards and cared for them there, if at all Before the war France had, in fact, a tuberculosis death rate three times as high as England and more than twice as high as that of New York City

Dr BIGGS, as well as the French authorities on whom he bases many of his statements, finds that this lamentable degree of tuberculisation was dependent on the virtual absence before the war of any effective administrative control on which the conditions obtaining on mobilisation had a specially baneful effect The extreme urgency made any thorough physical examination of the recruits impossible, with the result that many cases of latent and incipient tuberculosis were mobilised On this material the conditions of trench warfare, the cold and damp of the predominating underground life, relieved only by billeting in peasant houses with little air or sunshine, produced their inevitable effect, although by no means as speedily as might have been expected At the receiving hospital for the sanatoriums of Bligny, where for purposes of classification all tuberculous cases of whatever degree were sent in the first instance, Dr L GUINARD, the physician in charge, relates that out of the first 1500 patients 863 were found to have taken part in campaigning, of whom 395 had served between 6 and 12 months, 149 more than 12, 28 more than 18, 9 more than 20, and 8 more than 24 months High among the soldiers, the incidence of tuberculosis has apparently been larger among the 2¼ million people who remained in the invaded departments, of whom a large number have now been sent back by way of Switzerland Of the first 20,000 of these 25 per cent were estimated to be suffering from tuberculosis Among the civilian prisoners in Germany an estimate of 3 or 4 per cent has been made, while the proportion of tuberculosis among exchanged prisoners from Germany has been placed at 30 to 40 per cent

Few, if any, of these observers lay great stress on infection as a principal agent in the incidence of this war time tuberculosis Dr BIGGS frankly draws the simple lesson of the value of public health organisation and administration in control, ascribing the difference between England and France in respect of tuberculosis to the relative efficiency in the former of the public health service America, with its aptitude for learning lessons from the failures of others and with the nearer object lesson of the large incidence of tuberculosis in the Canadian Army, has just instituted a volunteer service of physicians with special experience of chest conditions, who will be commissioned for short periods of three months or so as lieutenants in a medical corps to re examine every man now in service in the reserve officers' camps and the national guard as fast as they are called up into federal service In this way it is expected to prevent the risks attendant on the arduous conditions of army service to those with any demonstrable tuberculous lesion Any persons who still contend that under the present conditions of civilised life infection is the main factor in the spread of tuberculosis should study with care and an open mind the story of tuberculosis in the French Army and Dr BIGGS's report upon it It is, of course, obvious that the complete segregation of the tubercle bacillus would remove tuberculous disease, and probably in the minds of those who uphold the infectious origin the syllogism rules The consumptive contains tubercle bacilli, tubercle bacilli should be segregated, therefore the consumptive should be segregated This view was presented by the London Insurance Committee in their recent report on the treatment of tuberculosis, a view which prevailed against the unanimous dissent of the medical members of the Committee The report laid strong emphasis on the infectious character of tuberculosis and on the contact with the tuberculous person as the main cause of the disease, comparing, indeed, tuberculosis with the common infectious fevers, and suggesting that the problem of segregation could be solved by adopting methods applicable to these transient affections Dr H HYSLOP THOMSON's article, which we publish in another column, makes a comprehensive survey of the methods of administrative control which, as experience has shown, are by no means covered by the avoidance of infection How could it be otherwise when at least seven eighths of our urban community and one quarter of our rural community have been demonstrably brought in contact with the tubercle bacillus, whereas less than 10 per cent ever suffer from tuberculous disease?

HOUSING IN SCOTLAND—The Local Government Board for Scotland has issued to the local authorities under its control a series of questions as to housing accommodation for the working classes similar to the series inquiring into such conditions in England upon which we commented last week The inquiry covers practically the same ground in both cases, but the Scottish local authorities are specifically asked for information in tabular form as to the number of existing houses containing four apartments and under excluding sculleries how many of these were in 1911 (the date of the last Census) and how many are in the present year occupied vacant overcrowded or sublet, defective or uninhabitable—whether occupied or not It is asked further that if the information can be subdivided conveniently particulars shall be given separately as to houses containing one two three and four apartments The question is a pertinent one when it is borne in mind that in a house of less than four rooms there cannot be in addition to a kitchen or living room accommodation for sons and daughters separate from one another and from their parents

Annotations.

"Ne quid nimis"

THE MEDICAL MAN IN PARLIAMENT

MAIDEN speeches were made in Parliament this week by two notable recruits to the small number of medical men representing constituencies in the House of Commons—namely, Sir W Watson Cheyne, the Member for Edinburgh and St Andrews Universities, and Sir A Garrod Thomas, the Member for South Monmouthshire In each case the speaker's words owed authority to his medical position and scientific training, but in each case the well being of the community at large, and of that vast section of the public which is fighting our battles in the trenches, inspired the arguments The speeches were not by doctors for doctors, which is to say that Sir Watson Cheyne and Sir Garrod Thomas are seen fully to understand the right rôle of the professional man in a general assembly of deliberation Parliament exists for the good government of the people, and men of special equipment find their place there not as advocates of their class but as exponents of the views of that class where questions of public importance are at issue Sir Watson Cheyne put admirably, and indeed unanswerably, the arguments against the official recognition for purposes of the Navy and Army of unqualified medical ministrations Officers and men can consult any irregular practitioners if they choose, but it is impossible for the Admiralty or the War Office to take the responsibility of handing over the medical care of their employees to persons whose scientific equipment has received no standardised tests Sir Garrod Thomas addressed himself to a question which, like that of the unqualified practitioner, is not new in the House of Commons, but about which more will certainly be said He called attention, in quite restrained terms but with facts behind him, to the anomalous distribution of medical men between the fighting forces on the one hand and the civilian population on the other, alleging that the Army in France has many medical officers whose time is but scantily employed, while showing that in certain civilian centres no possible display of energy by the few men left to do the work enables them to keep level with their duties Mr Macpherson, replying for the War Office to the arguments of both speakers, stated that the Department would not take the risk of employing unqualified persons He also announced that a Committee would be appointed to inquire whether any misuse had occurred in the employment of medical men in France We are glad to know that this Committee will be appointed immediately The medical profession is anxious to learn what are the rights and wrongs of a very important matter To say that the temporary unemployment of medical officers in their ambulance capacity merely implies low casualty lists at certain times is a perfectly satisfactory answer in many of the cases of apparent waste of medical material which have been brought forward, but other instances of misuse have been alleged which do not fall under this category, and which should certainly be the subject of investigation Sir Watson Cheyne and Sir Garrod Thomas have made their mark as Parliamentary debaters with far less delay than is usual among new Members and the medical profession welcomes their presence in the House of Commons

THE LONDON SCHOOL MEDICAL SERVICE AND THE WAR

THE increasing importance which is being attached by all public authorities to the conservation of the health of the nation's children is illustrated by the action just taken by the London County Council in restoring the personnel of the School Medical Service to its pre war footing As a war emergency measure the London County Council in November, 1915, decided to reduce its school medical staff by the equivalent of four and a half school doctors and four school nurses This reduction was carried into effect largely by modifying the procedure in relation to the examination of the entrant infant children It was decided that in place of the detailed examination of all entrants there should be substituted a preliminary cursory inspection of entrants followed by a detailed examination only of those picked out by the school doctor as obviously ailing The effect of this alteration is set out in the annual report for the year 1916 of the school medical officer which has recently been issued In this report reference is made to the apprehension naturally entertained that this modification of the procedure would result in failure to discover defects of an important nature in many of the children That this fear was based upon solid grounds is shown by the fact that under the new method there was in 1916 a leakage to the extent of 12 per cent in the children found to have defects necessitating advice Dr W H Hamer concluded that it would be necessary to revert to the former practice of examining each entrant infant in detail as soon as the conditions of National Service make it possible so to do Some years ago, it will be remembered, there was an acute public controversy on this very question in the course of which Sir Victor Horsley vigorously took up the cudgels in favour of a complete detailed inspection of entrant children in place of what he then described as "the march past" The results given in Dr Hamer's recent report constitute a testimony to the correctness of Sir Victor Horsley's views It is to the credit of the London County Council that so soon as the results of their new departure were communicated to them by their school medical officer, and without waiting for any mitigation of the present stress upon the medical profession, they decided at once to restore the school medical staff to the original strength, on the ground that the welfare and care of the children must take precedence, even at the present time, of all other matters

OUTBREAKS OF ŒDEMA IN GERMANY

WAR conditions have given occasion in Germany for the study of an "œdema disease" practically unknown in peace practice The most considerable study has been made by Dr A V Knack and Dr J Neumann at the General Hospital of Hamburg Barmbeck[1] These observers deal with a series of cases among the civil population in whom the œdema was generally located in the feet and legs, occasionally in the thighs and trunk In more than one half some degree of facial swelling was present, in one sixth of the cases the hands were swollen, and in one ninth ascites was present Men were more affected than women, young children not at all, the youngest certain case being 12 years old In all severe cases a diminution was found in the refractive index of the serum, implying a hydræmic condition of the blood Recovery always followed rest in bed on ordinary hospital diet, and restriction of fluids was rarely necessary Convalescence was, however, slow To determine the cause of the œdema the authors sought to secure its return in convalescents by restricting the diet principally to turnips, and by giving large quantities of water internally Neither measure separately ever produced the result, but with restriction of diet plus water drinking, the œdema rapidly returned in convalescent patients Chemical examination of blood and urine showed a diminution in lipoids and in the organic phosphorus content of the body Dr F Lange[2] discusses the causation of a group of similar cases observed by him among the industrial workers in a West Prussian centre, concluding that a diminished permeability of the blood vessels was present, due to a qualitative alteration in the food, perhaps to the extreme deficiency of calcium. A study by Dr W Hülse, from the pathological institute of Breslau, on the origin of the œdema disease in prison camps,[3] led to much the same conclusions, except that it was more frequently found as a sequel to relapsing fever, a frequent plague of such camp life, and in men who had previously been long exposed to extreme cold The condition may be taken as one of the signs of imperfect nutrition due to restricted diet

THE SOLDIER AND THE CIGARETTE

THE question whether cigarette smoking does material harm to health has come into greater prominence now that the habit is almost universal amongst our troops There can be little doubt that the soldier looks upon the cigarette as part of his kit, as affording him a source of genuine comfort in strenuous times and as increasing the pleasures of relaxation when his nerve racking duties are for the time in abeyance Everyone knows that tobacco smoking has been associated from very remote times with phases of relief from stress and intense activity, the aborigines of America smoked the pipe of peace as much for this cause as to lend gravity to a *pow wow* The practice of smoking provides unquestionably a mental anodyne, and that fact alone accounts for its universality in the present bitter days It must be remembered, however, that tobacco smoking is a species of drug habit, although perhaps a mild one if we leave out the question of excess, and that the continual drawing of tobacco smoke into the mouth or, worse, deeper into the respiratory tract, introduces toxic risks Hygienically, of course, air that contains poisonous products of combustion would be condemned as departing from a standard of purity demanded by healthy respiration Moderate smokers, however, as a rule show no depreciation of normal health It has been suggested that there may be a relationship between cigarette smoking and the "soldier's heart" In a careful inquiry into this subject, undertaken at the instance of the Medical Research Committee by Dr John Parkinson and Dr Hilmar Koefod, the results of which we publish this week, it is concluded that while excessive cigarette smoking is not the essential cause in most cases of "soldier's heart" it is an important contributory factor in the breathlessness and præcordial pain of many of them The immediate effect of cigarette smoking upon the circulatory system and upon the breathlessness of exertion was observed in 30 smokers, of whom 20 were cases of "soldier's heart" and 10 were healthy soldiers Each subject smoked either four or five cigarettes during a period of 40 minutes A demonstrable effect was recorded in 17 of the 20 patients, but it is interesting to note that the 3 unaffected were non inhalers Nine of the 10 controls, all inhalers, were influenced in the same fashion, though not to the same degree Generally the observations show that in health the smoking of a single cigarette by a habitual smoker usually raises the pulse rate and blood pressure perceptibly, and these effects are a little more pronounced in cases of "soldier's heart' Moreover, the smoking of a few cigarettes can render healthy men more breathless on exertion, as was shown to be the case in a large proportion of the patients under examination The results show clearly that the soldier should be warned against inhaling, and, of course, he should avoid excess

BISMUTH POISONING

THAT toxic and even fatal results may follow the use of bismuth is not generally appreciated, though the late Professor Kocher in 1903 condemned the use of bismuth subnitrate as a dusting powder for granulating wounds because he had observed ill effects Stomatitis, with ulceration and loosening of the teeth and pigmentation of the buccal mucosa, vomiting, diarrhœa with passage of blood and mucus, and nephritis are the principal manifestations In the *Cleveland Medical Journal* for June Professor John Phillips, of the Western Reserve University, has reported the following case A lad, aged 18 years, was admitted into hospital on Oct 7th, 1915 Three months before he was wounded with a pitchfork in the left knee The joint became red and swollen so that it had to be opened and drained A sinus was left which closed after some time Five weeks before he was seen he began to complain of soreness of the mouth, which grew rapidly worse, so that he could take only fluids He was much wasted The breath was offensive and foul mucus constantly dribbled from the mouth The posterior part of the tongue and hard palate, the uvula and the gums were covered with a dark grey necrotic mass which could be easily removed, leaving a bleeding surface The cervical glands were enlarged There was firm swelling of the left knee joint The urine contained a slight amount of albumin and hyaline and granular casts At first cancrum oris was diagnosed, as the slough obscured the pigmentation After about 10 days the slough separated, leaving a bleeding surface, and pigmentation of the mouth particularly of the gums, was observed Three days after admission he had three general convulsions A week later severe diarrhœa with much mucus and some blood in the stools, began It was then noticed that there was marked pigmentation of the rectal mucosa He became so anæmic that on Oct 23rd the red corpuscles numbered only 1,500,000 The correct diagnosis was not made until Nov 6th, when the X rays revealed in the knee joint a large quantity of bismuth (which it was then ascertained had been injected into the sinus) The joint was opened and as much of the bismuth as possible removed Transfusion of blood was performed but he died three days later The necropsy showed acute ulcerative colitis acute parenchymatous nephritis and diffuse brown pigmentation of the viscera, especially of the colon From the use of bismuth subnitrate another kind of poisoning—nitrite poisoning—may result Professor Phillips reports two cases A child, aged 4 years, was seen in consultation On the previous day she had been given for colitis a drachm of bismuth subnitrate in a starch enema. Twelve hours later she became nauseated, very cyanosed with a small weak pulse, and partially comatose This condition continued throughout the day The blood was very dark The colon was irrigated repeatedly Within 24 hours she was much better, the cyanosis being less marked, and by the third day all the symptoms had disappeared In the second case a man, aged 50 years, was seen in consultation for stupor and cyanosis On the previous day he was given an ounce of bismuth subnitrate in milk for X ray examination of his stomach During the night he was nauseated and had a severe chill Towards morning he became cyanosed and unconscious When seen he was deeply cyanosed, the mucous membranes being plum coloured. The pulse was 140 and very weak. The colon was irrigated several times and much bismuth washed out Under stimulation and transfusion of blood he recovered These cases show that bismuth subnitrate should be given with care and not be used for the purpose of X ray examination

THE NEGLECT OF NATURAL SCIENCE

LAST year the Government decided to appoint a committee on the subject of scientific education in secondary schools and it was ultimately formed with Sir J J Thomson as chairman The committee were asked to inquire into the position occupied by natural science in the educational system of Great Britain, especially in secondary schools and universities, and to advise what measures are needed to promote the study of natural science, regard being given to the requirements of a liberal education, to the advancement of pure science, and to the interests of the trades, industries, and professions which particularly depend on applied science Amongst the important representations which have been brought before them are those from the "Committee on the Neglect of Science," presided over by Sir Ray Lankester In the opinion of this committee it is a matter of urgency, in order to promote national efficiency in the near future, that the natural sciences should be made an integral part of the educational course in all great schools of this country, and should form part of the entrance examination of the Universities of Oxford and Cambridge as well as of the newer universities It was also held that it is in the highest degree desirable that the Government should exercise the large power which it possesses of encouraging the study of the natural sciences and thereby increasing the efficiency of our public servants (1) by assigning capital importance to the natural sciences in the competitive examinations for the home and Indian Civil Service, (2) by requiring some knowledge of the natural sciences from all candidates for admission to Sandhurst The method indicated is held to be the only one by which it is practicable to bring about the desired change in the attitude of the schools throughout the country towards the natural sciences and to make general some knowledge and understanding of these sciences Clearly, as the results of such changes will only develop in the course of years, it is desirable, if they are determined upon action, that the matter should be at once taken in hand by the Government The Government Committee were also strongly urged to remove "the stumbling block of compulsory Greek at the Universities of Oxford and Cambridge," and it was pointed out that though a majority of the people who have given attention to the matter are now in favour of reform, the way is blocked by the non resident voters, and this way should, in the opinion of the committee, be cleared by Government interference It is suggested that more direct encouragement of science is needed, so that there should be an increased number of careers open for highly trained men, while existing scientific services should be expanded, so that men who had received high scientific training could find careers It is not proposed that the subjects of languages and history should be displaced, but there can be little doubt that there must soon be secured for the teaching of natural science a position of no less importance, as an essential component of a liberal education, than that which is now held by the teaching of languages and history, and the views of the Government committee on this question may well lead to important modifications in the curriculum at our centres of education

DEATH CERTIFICATION

THE serious and increasing shortage of medical men available for civilian practice is making itself felt in various ways The *Guy's Hospital Gazette* for July states that those responsible for dealing with acute cases sent up to the hospital are finding that the work of the general practitioner is gradually becoming less efficient Acute abdominal cases, it is here stated, are constantly being admitted in which perforation had evidently been present for some days In view of the urgent call on the practitioner's time in matters of life and death it is not unnatural that less time and thought are available for work of a more formal character At a recent inquest at Hackney held by Dr Wynn Westcott on the body of a labourer the unusual form of a death certificate excited comment The deceased was seen by a medical man on July 25th at his surgery, and by no other practitioner before his death, which took place on August 4th Meanwhile the medical man had gone away, and before doing so had signed a certificate which a colleague, who was temporarily attending his patients, filled up and handed to the relatives This, as the latter gentleman stated in his evidence, he did after making inquiries, but he admitted that he had not seen the patient when alive, nor apparently had he seen the body The jury accepted the certificate as accurate and returned a verdict of "Death from natural causes," adding that, in their opinion, the proceeding was irregular, the coroner having already made observations to the same effect While the giving of a death certificate in such a manner is irregular and obviously undesirable, we cannot find evidence that it is illegal It cannot be said to be in accordance with the spirit of the statute of 1874, which regulates the registration of deaths, but done as in the case under comment without any wrong intention it does not constitute an offence The Act (37 & 38 Vict c. 88) only orders that a medical practitioner attending a patient in his last illness shall sign and give to someone who has to give information to the registrar a certificate stating to the best of his knowledge and belief the cause of death Bef the Departmental Committee which inquired the law relating to coroners Mr J Brooke Litt in the course of his evidence, was asked whethe medical man was obliged to see the body after dea when he replied as follows —

> I think the Registration Acts do not point out in any how the medical man is to prepare himself for giving certificate, except that it appears to be assumed that certificate will be given by the medical practitioner attended the deceased during his last illness Section 2 the Act of 1874 makes it incumbent upon such a practitio to give a certificate of the cause of death in the prescrib form There is, however, no statutory direction that shall see the person after death before he gives certificate

The first part of this reply calls attention to t unsatisfactory looseness of the law as to who is be responsible for the giving of a certificate of t cause of death, although the question asked w directed to another point—that is to say, to t desirability of the medical man inspecting the bod as to which the certificate is given

SYNTHETIC ALCOHOL FOR COMMERCIAL PURPOSES

THE synthesis of alcohol from its component elements would afford great relief to a country like Switzerland, dependent for its usual supply of alcohol on outside sources and naturally loth to employ for the purpose any of its scanty stock of starch Dr Fleissig, apothecary to the Town Hospital in Basle, tells[1] how this problem has been solved, although, unfortunately, its complete technical application will require 18 months to work out. Calcium carbide is now produced in Switzerland to an annual amount of 70,000 tons, and is the starting point of the synthesis The acetylene evolved from it combines with a molecule of water to form acetaldehyde in the presence of a catalyst such as mercuric sulphate Two additional atoms of hydrogen, produced electrolytically unite with the aldehyde to form alcohol under the influence of certain metals as nickel, platinum, or palladium A ton of alcohol can thus be obtained from 2 tons of carbide and 500 cubic metres of hydrogen, requiring, apart from electrical energy, only 2⅓ tons of coal and 4 tons of chalk Switzerland's average requirement of 10,000 tons of alcohol would therefore demand the import of only some three quarter million francs worth of coal, while the ready made alcohol at present costs 4,000,000 francs The process requires, of course, a large amount of electrical energy—a ton of alcohol demands 11,000 kilowatts to produce—but this is readily supplied by the "white coal" available in the water power of Europe's central plateau We know well enough that alcohol may be synthetically produced from acetylene, but up to the present this has only been done on a laboratory scale In this case the method has been to convert the acetylene into ethylene by contact with hydrogen, and to pass the ethylene so produced into sulphuric acid, sulpho vinic acid resulting Finally, this acid when distilled with water gives alcohol The synthesis on a commercial scale will be watched with close interest by all those who use industrial alcohol

DONATIONS AND BEQUESTS —The late Mr S H. Whiting, of Charlton King's, Cheltenham, bequeathed £500 each to the Gloucester Royal Infirmary, Cheltenham General Hospital, and the Stroud Hospital, and £200 to the Cirencester Cottage Hospital

THE PROBLEM OF TUBERCULOSIS

By H Hyslop Thomson, M D Glasg , D.P.H Liverp ,
MEDICAL OFFICER OF HEALTH FOR THE COUNTY OF HERTFORDSHIRE

So much has been written about the problem of tuberculosis that any further contribution which contains nothing new with regard to the measures to be adopted for its eradication may well be considered by many as superfluous The present however, appears to be an opportune moment to review what has been done in the past and to endeavour to forecast to what extent present efforts require to be supplemented by further practical measures in order that this disease may be adequately and comprehensively dealt with. There exists no royal road to the solution of the problem of tuberculosis, and the present efforts which are being made throughout the country to stem its ravages have suffered to some extent from the fact that they are based on restricted, if expert views rather than on a broad comprehensive outlook The question is not infrequently asked why so much energy and thought are directed towards the solution of the tuberculosis problem to the apparent exclusion of other diseases, the answer is that in tuberculosis we have a fairly accurate index of the health standard of a community and that in the absence of any specific cure we are compelled to promote conditions which are inimical to the presence and spread of the disease, with the results that the health standard of the community is raised and resistance to attacks by other forms of disease is increased

Nomenclature

Various terms are frequently applied in relation to tuberculosis the use of which should be discouraged. The term phthisis is gradually being discarded although it is still too frequently used Pulmonary tuberculosis and lung tuberculosis are the only terms which can correctly be used to designate the pulmonary type of this disease. The popular terms consumption and consumptive, owing to the loose and inaccurate manner in which they are frequently used are responsible for much of the misconception regarding pulmonary tuberculosis which at present exists in the public mind While the term consumption is regarded as connoting a disease of high infectivity the term pulmonary tuberculosis suggests a morbid condition of much less severity Originally the term consumption was used to designate open cases of lung tuberculosis with classical signs and symptoms, but popularly it has come to be regarded as applicable to all forms of that disease The confusion caused in a patient's mind when he is informed that he is consumptive but has not consumption may well be imagined , the former term being sometimes loosely used to designate the so-called pretuberculous stage It must be admitted however that is extremely difficult to avoid the occasional use of these terms in general practice although the desirability of educating the public in the correct use of medical terms is obvious The medical practitioner is frequently asked the question if an individual has consumption and if the condition is one of early quiescent or closed pulmonary tuberculosis The wisest course to pursue is to answer in the negative and to state that the condition is one of lung tuberculosis which if progressive might eventually reach the stage popularly known as consumption The term pretuberculous has been not infrequently used to indicate a condition of health preceding actual tuberculous infection As a matter of scientific fact the majority of so-called pretuberculous cases are cases of early or latent disease and the term can only be correctly applied to that stage of lowered resistance which precedes actual infection with tubercle bacilli but as clinically we have no means of recognising or gauging this stage in relation to tuberculosis the term should be discarded as it is liable to mislead

Notification

The present methods of notification require to be [illegible] More detailed information is necessary so as to simplify and systematise measures adopted to prevent the spread of the disease The notification form should supply the medical officer of health with definite information on the type and stage of the disease the absence or presence of tubercle bacilli in the sputum and as to the [illegible] form of [illegible] a copy of such a notification form should immediately be sent to the medical officer of the authority responsible for the institutional treatment of tuberculosis Detailed information of this kind supplied at the outset by the general practitioner would facilitate the early and appropriate treatment of the disease and would enable health authorities to map out with ease the districts, streets, and houses in which cases of open tuberculosis most frequently occurred. For such information an increased notification fee would have to be paid, and the grading of such fee according to whether the sputum was examined or not would be desirable , but the value of such pioneer knowledge regarding each individual case is too apparent to require any extended argument Copies of Notification Form C, giving information of patients discharged from hospitals and sanatoria, should also be sent to the authority responsible for the scheme of treatment in county districts

Administration

If the present and future schemes for dealing with tuberculosis are to yield sustained and adequate results two essential conditions with regard to administration must be fulfilled. The first is the unification of all effort under one responsible authority, and the second is the provision of adequate facilities for prevention and treatment Under present administrative arrangements the efficient and expeditious treatment of tuberculosis is impossible Two authorities are locally responsible for administration in connexion with this disease, and one of these has quite insufficient funds to meet the demands for treatment This dual responsibility leads to duplication of effort and waste of time in unnecessary clerical work. The treatment of disease is never advantaged by elaborate reports and the expenditure of time and thought on clerical work, hence the desirability of adopting a simple uniform method of recording cases and of supplying information on application forms for institutional treatment The sending of patients to various institutions in different parts of the county leads to administrative difficulties but these cannot be overcome until each authority, or combination of authorities, provides its own facilities for treatment While existing schemes for dealing with tuberculosis take a fairly comprehensive view of the clinical requirements of the patient they do not include efficient and far reaching measures for conserving the results of treatment and for preventing the development and spread of the disease The care and after care of tuberculous patients have been left almost entirely to voluntary effort whereas they should be included as an important supplementary part of official schemes The questions of housing and occupation in relation to the prevention of the disease and the influence they exercise on the health and economic value of the individual with arrested tuberculosis must also be seriously faced

Preventive Measures

The causes of tuberculosis are too well known to require description Various conditions tend to impair the resistance of the human body to tuberculosis, and these are intimately associated, and for the most part interdependent Unhealthy home conditions more than any other factor pave the way for tuberculosis and they arise from three causes—viz insanitary surroundings, insanitary houses, and the insanitary habits of occupants When all three occur the incidence of tuberculosis is high and the health index is low The abolition of insanitary areas and the provision of adequate and efficient housing accommodation must constitute a part of the campaign against tuberculosis and a serious effort to solve the housing problem when the war is over may be anticipated Time and effort would be saved by the standardising of certain types of houses for rural districts Existing houses when they become empty should reach a certain hygienic standard before they are reoccupied The combined kitchen and sitting room with a large window surface with efficient cross ventilation and facilities for washing and cleanliness are essential features of a healthy working class house The insanitary conditions arising from neglect and ignorance are not so easily combated , in any effort to improve such conditions the services of the medical practitioner might be more extensively utilised During his professional visits the private medical attendant is in a position to note the evidence of dirt and neglect the closed window the diminished cubic space due to overfurnishing overcrowding the multitudinous array of knick knacks which harbour dust, and the food exposed to contamination by dust and flies By tact and timely suggestion he would be able to secure some improvement , but should conditions remain so unsatisfactory as obviously to impair or endanger health he should be in a position to fall back on energetic action by the health authorities While the modern trend of social improvement is towards the State becoming responsible for much to the individual, the latter must realise that he will be called upon to be responsible for much to the State Certain channels of infection require to be dealt with by legislative measures if the spread of tuberculosis is finally to be checked and controlled Legislation to provide a milk supply free from contamination by tubercle bacilli and other organisms is long overdue, while the provision of central public abbatoirs is an obvious public health measure, in view of the dangers arising from tuberculous meat The segregation of certain types of laryngeal and pulmonary tuberculosis is also an essential prophylactic measure

Institutional Treatment

The institutional treatment of tuberculosis includes dispensary treatment, sanatorium treatment, the hospital treatment of pulmonary tuberculosis, and the hospital treatment of non pulmonary tuberculosis The dispensary provides a centre for the diagnosis and treatment of early cases and for the observation of suspects and doubtful cases The importance of the dispensary as a unit for the observation and treatment of doubtful cases is obvious when it is realised that by this means a longer term of sanatorium treatment is secured for definite cases of the disease The insistence of the sanatorium physician for early cases is well known, but the whole scheme suffers if early cases are confounded with doubtful cases The work in connexion with the dispensary system is for the most part carried out by whole time officers, and this is, no doubt, the best method of carrying out this part of the scheme, although a closer coöperation between the dispensary officer and the general practitioner is desirable It has been suggested that the work in connexion with the dispensary should be uniformly carried out by a rota of general practitioners, with the tuberculosis officer acting in a consultative capacity This would no doubt have certain advantages and would be practicable under altered conditions, but it is difficult to conceive the clerical work inseparable from record taking recommending itself to the busy practitioner The hospital treatment of acute and advanced cases of pulmonary tuberculosis constitutes the most important part of the scheme both from the treatment and preventive standpoint Experience has shown that in the absence of such accommodation a gap exists between the dispensary and the sanatorium which makes efficient and expeditious dealing with tuberculous cases impossible Hospital treatment means skilled medical attention, efficient nursing and up to-date hospital administration, and while it makes provision for the segregation of advanced cases it also provides facilities for the treatment of acute cases of recent onset by induced pneumothorax, antiseptic and other measures, as a result of which a certain proportion are saved At the present time there exist no compulsory powers for the removal of advanced cases although such are desirable in certain types of the disease under certain conditions In the absence of such powers it is necessary to make the hospital inviting to the patient by instituting a reputation for efficiency of treatment and administration The Hertfordshire County Council has recently opened a hospital with the provision of 30 beds for acute and advanced cases, and the experience of the last few months in that institution has proved that the acme of the infectivity of pulmonary tuberculosis is reached during the last few weeks of life, and that the knowledge of being transferred to the sanatorium when a certain stage of improvement is reached provides a strong incentive to the patient to remain and persevere with treatment

The sanatorium treatment of tuberculosis has been carried out in this country for over 20 years, and while its benefits are undoubted, its limitations as the treatment is at present carried out, are definite That the present sanatorium methods do not yield the results expected must be admitted and the explanation is threefold Firstly, in the absence of adequate hospital accommodation unsuitable cases are sent to the sanatorium, secondly, the popular view that three months' treatment in a sanatorium will suffice to secure permanent arrest of the disease must be discarded, and, thirdly, the after care of patients, with the provision of suitable employment, &c, must constitute an official part of the scheme If sanatorium treatment is to yield the best results the question of the patient's capacity for work and of his future employment must be intimately linked with the treatment throughout its whole course The sanatorium should be reserved for early and non reactive cases, and simultaneously with improvement in health the patient should be instructed and employed in outdoor occupation, experience in which will subsequently prove of value to him To secure the best results, therefore, the sanatorium should be remodelled on the basis of an industrial institution, while the duration of residence should be considerably increased. In the industrial sanatorium the buildings would be of simple construction, and chief attention would be centred on the land and on facilities for useful employment. No tuberculous patient should be discharged from a sanatorium so long as there exists any possibility of further improvement and while there is no prospect of immediate return to suitable work. Work means wages and food, and good food with healthy home conditions is essential to maintain the condition of arrest and economic cure which is obtained by prolonged residence in a sanatorium The Hertfordshire County Council has purchased a site which is well suited for an industrial sanatorium of this kind, and it is anticipated that on the conclusion of the war the building will be proceeded with The value of tuberculin in the treatment of pulmonary tuberculosis has been much debated, but, as was pointed out some years ago by the writer, tuberculin gives the best results when employed in the sanatorium at the stage when the beneficial auto-inoculation induced by graduated manual labour is on the wane

The hospital treatment of non pulmonary tuberculosis is carried out either in special open air hospitals or in general hospitals At the present time the provision of such accommodation for insured persons is quite inadequate The treatment of non pulmonary tuberculosis on rational lines well repays the time and cost involved Experience has shown that such cases can be efficiently dealt with in general hospitals in small urban districts The good results obtained by exposing indolent tuberculous lesions to fresh air and sunshine are becoming more fully recognised

Domiciliary Treatment

The question of the domiciliary treatment of tuberculosis is one which calls for some consideration It must be admitted that domiciliary treatment has not proved as successful as was anticipated. No doubt, owing to the war it has not had a fair or extended trial, but under the present system it is doubtful if it will prove satisfactory even in normal circumstances If the domiciliary treatment of tuberculosis is to meet with any measure of success two things must occur at the outset—namely the existence of fairly healthy home conditions and the recognition of the necessity of rest under open air conditions when the temperature is raised In the absence of this essential rest when the temperature is above the normal the individual with pulmonary tuberculosis will sooner or later walk himself into his grave The present system of domiciliary treatment requires to be remodelled A uniform method of carrying out the treatment according to well-defined rules is desirable The method of record keeping in connexion with domiciliary treatment should be of the simplest character and should consist of a special card similar in some respects to that used in connexion with medical benefit The present method of payment for the services of the general practitioner in connexion with the treatment of tuberculosis is not quite satisfactory and might with advantage be altered Some uniform procedure with regard to the prescribing of drugs and appliances is also desirable. A special formulary for use in domiciliary treatment would be a distinct advantage It would also serve a useful purpose from a prophylactic standpoint if all chemists kept in stock a standardised sputum flask which could readily be obtained by prescription A closer coöperation between the tuberculosis officer and the family practitioner is desirable This demands tact and knowledge on the part of the former and willingness to coöperate on the part of the latter In not a few cases in my own experience the value of such close coöperation to the patient has been proved Under present conditions, however the time of the tuberculosis officer is too much occupied in dispensary work to permit of such coöperation, although the importance of a high standard of domiciliary treatment cannot be too strongly emphasised In domiciliary treatment prevention and treatment must act in unison, as it is in the homes of the people that there exists the greatest need for the carrying out of adequate prophylactic measures

Care Treatment

The care treatment of tuberculous patients constitutes an important and essential adjunct to medical treatment The Public Health (Prevention and Treatment of Diseases) Act, 1913, enables public health authorities with the sanction of the Local Government Board to carry out measures for the care and control of tuberculous patients The aim of such measures is to increase and conserve the good results obtained by medical treatment, and at present they are carried out through the agency of voluntary care committees The experience of the past few years has emphasised the desirability of coördinating such efforts in one comprehensive and official scheme, so that there may be sufficient financial help to secure effective sustained, and uniform action The extent to which the working capacity of the individual with arrested tuberculosis is made use of as a national asset depends in large measure on the assistance he obtains in securing suitable employment The economic question in relation to tuberculosis is of such far reaching importance that it cannot be overlooked in any comprehensive scheme for dealing with this disease. The outdoor relief granted by boards of guardians to chronic and advanced cases of tuberculosis has frequently proved of value, and it would in great measure solve the problem of care treatment if this department of the Poor law system so far as it relates to actual disease were reorganised and were transferred to public health authorities as an official system of care and help in connexion with tuberculosis and other diseases

Tuberculosis and the War

One of the many effects of the war has been to broaden our outlook in connexion with tuberculosis and other health problems The influence exercised by military service on the disease itself is now more accurately estimated. While the conditions inseparable from active service abroad is liable to diminish the resistance to tuberculous infection the life associated with military training in this country undoubtedly exercises a beneficial effect on the health of the soldiers The military authorities for some time have been exercising considerable care with regard to the admission of possible cases of tuberculosis to the Army Men with healed or localised latent pulmonary tuberculosis, however, are not unfit for certain forms of military or other national service, indeed, under favourable conditions they benefit by it. Given fresh air good food and regularised physical exercise, such cases undergo marked improvement in general health and physical vigour The contra indications however, are definite, and are as follows (*a*) the presence of tubercle bacilli in the sputum, (*b*) a temperature range above the normal (*c*) the presence of crepitations or other gross physical signs and (*d*) a history of tendency to hæmoptysis In the majority of cases discharged from the Army suffering from tuberculosis in the writer s experience the men have been on active service and the disease has been acute and progressive in type This fact accentuates the urgent need for adequate hospital accommodation, for not only is it a national duty to provide the type of treatment best suited to the requirements of each discharged soldier but it is highly desirable from the viewpoint of public health that cases in which the disease is acute or advanced should be transferred immediately to a suitable hospital for treatment

Conclusions

The death rate and attack rate from tuberculosis and the infant mortality constitute a fairly reliable combined index of the health standard of a community If these rates are low the death rate from almost all other diseases is also low important possible exceptions being malignant disease and organic heart disease The expenditure incurred in connexion with the treatment of tuberculosis will fail to secure an adequate return unless searching prophylactic measures are simultaneously carried out and unless such treatment is supplemented by an official scheme to conserve the beneficial economic results obtained The measures which are recognised as essential for the prevention of tuberculosis are also instrumental in raising the general standard of health and in protecting the individual from other forms of disease, this fact alone emphasises the importance of a broad and comprehensive outlook in dealing with the problem of tuberculosis

THE CONTROL OF VENEREAL DISEASES

The American Association for the Control of Syphilis

WE have received from Dr M F Engman of St Louis Mo, a statement of the objects of the American Association for the Control of Syphilis, which was organised at Cincinnati on May 23rd and 24th last These objects are the promulgation of knowledge of syphilis among medical men, medical institutions, boards of health, hospital boards, dispensary attendants and boards, and other organisations having the care and treatment of syphilis It is hoped to develop the investigation of the disease from the social and economic sides Plans are being made to collect standardised statistics from the various institutions now treating syphilis, to further the establishment of free clinics and dispensaries for the diagnosis and treatment of syphilis, and to encourage the more comprehensive teaching of syphilis in medical schools The association proposes to operate through a national body and local branches in various cities, acting in close coöperation with the American Social Hygiene Association The membership of the association at present is composed of the following —

Dr W T Belfield (Chicago) Dr Ernest D Chipman (San Francisco) Dr W T Corlett (Cleveland) Dr Isadore Dyer (New Orleans) Dr M F Engman (St Louis) Dr J A Fordyce (New York) Dr Marcus Haase (Memphis) Dr H H. Hazen (Washington) Dr M B Hartzell (Philadelphia) Dr H B Kleinschmidt (St Louis) Dr G M MacKee (New York) Dr E L McEwen (Chicago) Dr W H Mook (St Louis) Dr H Morrow (San Francisco) Dr H. J Nichols (San Francisco) Dr Oliver Ormsby (Chicago) Dr Sigmond Pollitzer (New York) Dr W A Pusey (Chicago) Dr A. Ravogli (Cincinnati) Maj Matthew Reasoner (Washington) Dr J F Schamberg (Philadelphia) Dr Morton Smith (Boston) Dr W F Snow (New York) Dr H W Stelwagon (Philadelphia) Dr G H Walker (Baltimore) Dr Grover Wende (Buffalo), Dr Udo Wile (Buffalo) Dr J M Winfield (Brooklyn) and Dr H R Varney (Detroit)

The following are the executive officers of the Association Dr M F Engman president, Dr J F Schamberg, vice president, Dr H E Kleinschmidt secretary and treasurer, 607, Federal Reserve Building, St Louis, Mo

Unqualified Prescribing and Advertisement

At the meeting of the London County Council last week the Public Health Committee reported as follows —

> An Order dated July 18th has been made by the Local Government Board under section 1 (2) of the Venereal Disease Act, 1917, applying to the areas of certain counties (including London) and county boroughs section 1 (1) of the Act prohibiting any person in such areas other than a qualified medical practitioner for reward either direct or indirect from treating any person for venereal disease or prescribing any remedy therefor or giving any advice in connexion with the treatment thereof whether the advice is given to the person to be treated or any other person The Act also prohibits the issue of advertisements relating to the treatment of venereal disease and, as from Nov 1st 1917 the issue of advertisements relating to the sale of preparations to be used as medicines or medicaments for the prevention cure and relief of any venereal disease The prohibition with regard to advertisements does not however apply to announcements by local or public authorities published with the sanction of the Local Government Board or to publications sent only to duly qualified medical practitioners or wholesale or retail chemists for the purposes of their business

Treatment of Venereal Disease at Portsmouth

A report on the work of the department established under the Venereal Disease Act, 1917, was submitted to the Committee of the Royal Portsmouth Hospital at their meeting on July 20th, by Captain A. Cambell R A.M C (T), medical officer in charge A detached building in the grounds of the hospital has been utilised for the purpose The staff consists of two medical officers, one sister, and two orderlies The department has been open for five months and during that time there were 152 males, 120 women, and 26 children, with a daily average attendance of 60 to 70 patients Civilians only were treated, women patients failed more than men to realise the necessity of attending regularly Few women living vicious lives sought treatment, but many young girls attended The attendance of cases of congenital syphilis was most satisfactory mothers being anxious to bring their children The results clearly showed that the clinic was doing excellent work

Facilities in Devon and Cornwall

The committee of the Royal Devon and Exeter Hospital has decided with the sanction of the Local Government Board to provide an out-patient department for venereal diseases and a certain number of beds for in patient treatment

At the last meeting of the Cornwall County Council it was decided to establish at once a clinic for venereal disease in the county at an estimated cost of £400

Public Measures of Control in Germany

The Reichstag has accepted the recommendations of its Committee on Population in regard to measures for combating venereal diseases These include (1) To make it a penal offence for a person who knows, or has good reason for knowing, that he has venereal disease to indulge in sexual intercourse, (2) to schedule venereal diseases in the Public Health Acts, (3) to set up treatment centres in each commune, (4) to engage the help of clubs and friendly societies, (5) to obtain accurate statistics of prevalence, (6) to make an examination in venereal diseases part of the final test for the medical diploma Other more radical measures were postponed for the present

The Remuneration of Medical Officers of Treatment Centres

The resolutions of the Council of the British Medical Association in regard to the remuneration of medical officers attached to venereal treatment centres were recorded in THE LANCET of Nov 11th last At the recent Representative Meeting, where these recommendations came up for discussion, it was decided to make no distinction in regard to remuneration between London and the *provinces* and *to* leave the fixing of the scale to the local option of the divisions The recommendation, as accepted by the Representative Meetings, runs as follows —

That the *following scale* of remuneration for part time senior medical officers of clinics be approved and recommended to divisions as a guide in their negotiations with local authorities:—

	Per session
For one or two sessions per week not exceeding 2½ hours each	£3 3 0
For three or more sessions per week, not exceeding 2½ hours each ..	2 12 6

The proper minimum salary for a whole time resident clinical assistant was also fixed at £250

PARIS

(FROM OUR OWN CORRESPONDENT)

Antityphoid Revaccination

THE Under Secretary of State for the Service de Santé has issued to the sanitary services an order to proceed with the antityphoid revaccination of all those who have not been revaccinated within two years Several cases of typhoid fever have appeared in the war zone as well as at the depôts even among those already vaccinated according to the regulations in force Bacteriologists estimate the duration of immunity resulting from the use of the various vaccines as not longer than two years The vaccines employed at the beginning of the war comprised three successive inoculations at intervals of six or eight days, but the men often received only one or two injections as a result of lack of time or the occurrence of acute indisposition following the first puncture The new order prescribes revaccination, employing a single injection of the same vaccine as was used in the first instance At present four brands of vaccine are in use in the French Army and Navy, most frequently that of M Vincent sterilised with ether, those of M Widal and M Chantemesse sterilised by heat—the most recent—and that of M le Moignic, where the culture is suspended in an oily medium a specially useful vaccine for troops, inasmuch as immunity is assured after a single injection

Transmission of Anthrax by the Sheepskins worn by Soldiers

Many soldiers during cold weather wear a sheepskin coat over their uniforms to protect against damp and chills At Marseilles Dr Roger recently noted among the troops several cases of malignant pustule undoubtedly due to a virus transmitted by the sheepskin The pustules appeared on the thorax, neck, and cheek In the last case the soldier was inoculated while sleeping with his head supported on his arm One death occurred Dr Roger recommends the systematic disinfection of this kind of clothing before it is handed out to the men

The Relation of Blood Pressure to the Age and Resistance of the Soldiers at the Front

M de la Prade has examined at the front a number of infantry, territorial, and artillery men, selected from those who have been between 20 to 30 months at the front and have thus suffered all the fatigues of war He classifies his 87 observations according to age-groups 20–30 years, 30–40 years, 40–43 years and, finally, over 43 years, with averages of strain for each group. He finds that at 40 years and over the blood pressure reaches the limit of the normal indicating the point at which circulatory equilibrium ceases to be sufficiently elastic to support a sudden considerable strain Above 43 years pressures become pathological. M de la Prade's conclusions are reassuring Trench warfare appears to have been borne well by the great majority of the troops at the front Men of 40 years should be considered to a certain extent From 43 years and on it is advisable not to place much reliance on the men Their physical resistance is no longer equal to the continuous fatigue of warfare, at any rate in the front line

Penetrating Wounds of the Abdomen

M Barnsby recently reported to the Society of Surgery the *result of the treatment* of 61 abdominal wounds observed during seven months at an advanced surgical post Of the 43 submitted to operation only 28 were found to have wounds penetrating the viscera and were retained at the post Among these 28 treated by immediate laparotomy there were 15 recoveries and 13 deaths The patient with an abdominal wound generally arrives in a state of shock, he is placed at once in a very warm room, where pulse and respiration are counted and arterial pressure determined At the same time morphine, camphor, and intravenous injections of camphor and adrenalin are administered The stay in this room is made as short as possible M Barnsby shows his preference for chloroform as an anæsthetic, finding that when ether is used chills often result, leading too often to pulmonary complications No hesitation, he says, should be felt in making an extensive opening at the outset Warm saline should be used to irrigate in order to avoid chill to the viscera and fall of blood pressure Perforations of the small intestine he holds, should be sutured in two planes after refreshing the edges of the wound Drainage should be for as short a time as possible, and the abdominal wall united in one plane with metal stitches The patient may be moved from the first or second day, but should be under observation and kept still from the fifth to the seventh day

Treatment of Discharged Soldiers in Hospital Annexes

At the beginning of 1916 the municipality of Paris, on the proposition of MM Dausset and Henri Rousselle, voted a sum 5¼ million francs for the isolation and treatment of discharged soldiers suffering from tuberculosis or affections of the respiratory passages In spite of the difficulties occasioned by lack of material and labour 700 beds are now available in ten temporary buildings erected as annexes to the following hospitals Laënnec Saint-Antoine, Cochin Lariboisière, Tenon Broussais, Salpêtrière La Rochefoucauld and Debrousse By the end of this year 1400 other beds will be available for patients at the institutions of Brévannes, Lagache Ivry, and Bicêtre

August 11th

THE SERVICES

ROYAL NAVAL MEDICAL SERVICE

Surg Gen D T Hoskyn is placed on the Retired List

Staff Surgeons to be Fleet-Surgeons: T B Shaw A. T Gillleton G S Davidge P T Nicholls

The following appointments have been notified:—Surgeon General P B Handyside to Chatham Hospital Fleet-Surgeons K. A Jones to *Victory* to *Pembroke* J Whelan to *Royal Arthur* and R L. Jones to Chatham Hospital, Temporary Surgeons K B A. Aikman to *Victory* and W Everett to D Southerland and J A. Hadfield to Plymouth Hospital.

ARMY MEDICAL SERVICE

Temp Col M MacLaren C M G Canadian A M C to be Deputy Director of Medical Services

Temp Lieut. Col C E Doherty Canadian A.M C to be Assistant Director of Medical Services

Temp Major J S Jenkins, D S O Canadian A.M C and Temp Capt H B Logie Canadian A.M C to be Deputy Assistant Directors of Medical Services

ROYAL ARMY MEDICAL CORPS

Hon Lieut-Col A S Woodwark to be temporary Lieutenant-Colonel

Temp Hon Lieut. Col Sir John Collie to be temporary Honorary Colonel

Sir Alexander MacCormick to be temporary Colonel

J F O Carroll to be temporary Honorary Lieutenant *Colonel*

Hon Major S W Woollett to be temporary Major

Lieut.-Col. W T F Davies D S.O late Imperial Light Horse, and Temp Capt H D Gillies to be temporary Majors

The undermentioned officers T F to be granted temporary rank:—As Lieutenant-Colonels: Lieut -Cols J Godding London Regiment J W H Brown Royal Engineers As Majors Majors H T Jenkins Royal Welsh Fusiliers S G Ogilvy Royal Scots J Gott Hampshire Regiment T W Mead Royal Engineers J A Wait, Royal Garrison Artillery W E M Corbett Devon Regiment W Murray Royal Field Artillery As Captains Capts C W Milner Notts and Derby Regiment F R Lucas Royal Scots As Lieutenant: Lieut R G Oram London Regiment.

Major W L Bennett is placed on Half pay List

Temp Capt R H Bremridge to be temporary Major

Temp Capt R. J McEwen Canadian A.M C to be acting Major while specially employed

Temp Capt. E M Lithgow Royal Highlanders to be temporary Captain

Temporary Lieutenants to be temporary Captains D N Knox E G D Milsom E G H Weir E Rommel, R Maclean E W H Cruickshank R. Massie W P Wippell, J J Anning D McC Aitken J F Sandilands

To be temporary Captains J J Boyd T R St Johnston W P H Munden C A Moseley G E Manning R F Gill J M. Renton R Milne, J S Joly O R M Kelly (temporary Captain from the General List) J W McIntosh (Canadian A M C) E Fidlar (Canadian A.M C)

R F Yencken and A E Lyster late temporary Captains to be Honorary Captains

R S Moon to be Lieutenant

To be temporary Lieutenants H L. Clift, J R Watson W J Stephens H. A. Des Brisay (Canadian A M.C) A T MacKenzie S Bree, S G Corner D A Dewar W J D Bromley T Winning A. Davies R Davidson E R Wade J W Simon K R C Hallowes, W L English C U Whitney T B Mitchell E Banks P T J O'Farrell C A Joll A. S M Palmer E E Cassidy L D Stamp H P Dawson, A M Laurie J Donaldson F U Williams H. M Reeve M F Emrys Jones S M Vassallo W G Riley J F Hornsey A Morton A Barker D Purdie R L. T Kewer F Coates F D Parbury S L O Young N McC Hutchison F D Nicholson

G Hodge to be temporary Honorary Lieutenant

Officers relinquishing their commissions: Temp Capts H G Gillissie (Canadian A.M C) N E MacDougall M C. Burke F J Brodie G M Gregoire S J C Fraser and H J M Adams (on account of ill health) Temp Lieut A H McCandlish G C March and D North (on account of ill health) and E Fidlar

Temp Hon Capt C F R McDowall having ceased to be employed with the Moss Side Military Hospital relinquishes his commission

SPECIAL RESERVE OF OFFICERS

To be Lieutenants: A B Platt E N P Martland W T G Boul and N Kletz (from Manchester University Contingent O T C) W Fidinow A G F McArthur R D Aylward (from the University of London Contingent O T C) S H de G Pritchard F W A. Watt W M Jones (from Manchester University Contingent O T C) H M Holt (from Leeds University Contingent O T C)

TERRITORIAL FORCE.

To be acting Lieutenant Colonels whilst commanding a Field Ambulance: Major F W Johnson and Capt L. A Dingley

Major (acting Lieut Col) G Ashton relinquishes the acting rank on ceasing to command a Field Ambulance.

Capt H F Humphreys is seconded whilst holding an appointment as Deputy Assistant Director of Medical Services

Capt B H C Lea Wilson remains seconded for duty with the Egyptian Army

Captain W Seymour is restored to the establishment

Capts. (temp. Majors) A. Young and L G J Mackey relinquish their temporary rank on alteration in posting and are restored to the establishment

Capt J P Fagan relinquishes his commission on account of ill health

Lieut D H Burleigh from Special List to be Lieutenant

VOLUNTEER FORCE.

W F Bond 2nd Battalion Derbyshire Volunteer Regiment and W R Paton 3rd Battalion to be Lieutenants and Medical Officers

DEATHS IN THE SERVICES

Lieutenant Colonel Alfred F S Clarke late R.A M C died at his residence at Bexhill-on Sea on August 11th aged 73. He joined the Army in 1861 as staff assistant surgeon and was appointed later assistant surgeon to the Black Watch in India. He was afterwards assistant surgeon subsequently reaching the rank of surgeon major in the Royal Artillery and was at one time attached to the famous A Battery A Brigade of the Royal Horse Artillery The Chestnut Troop" Later he became surgeon to the Royal Military and Staff College Sandhurst where he served for 22 years. In 1876 he received the thanks and praise of the Duke of Cambridge then Commander in Chief for his prompt and energetic action in preventing the spread of an epidemic of diphtheria in the Sandhurst College

---

THE LATE MR JAMES MCCULLOUGH L R C P & S EDIN —The death is announced of Mr James McCullough which took place on August 2nd in the Royal Victoria Hospital Belfast where he underwent an operation on July 11th He succumbed owing to heart failure A native of Saintfield Mr McCullough practised for years in Belfast where for a time he was a member of the board of guardians One of his sons is a member of the medical profession and one of his daughters is a nurse

THE LUMLEIAN LECTURES AND MEDICAL RESEARCH

THE RENAISSANCE OF MEDICINE

To the Editor of THE LANCET

SIR —The intervention of Sir Clifford Allbutt[1] in this discussion emphasises the difference between the old and new schools Hitherto the description and investigation of disease have been left mainly in the hands of hospital and consulting physicians and laboratory workers, who have dominated the profession and have believed that their methods and opportunities were such as enabled them to survey the whole field of medicine They have not realised that on entering on their work they put on blinkers which restricted their outlook, so that their field of experience has been extremely limited, and that there were whole fields essential to the progress of medicine outside their ken For instance there is one great field that needed investigation which the events of to-day have forced us to consider—the amount of work a man in impaired health is capable of undertaking This is a matter which every general practitioner has to consider, and no precise information is to be found anywhere When the enlightened management of the London Hospital asked me to organise a cardiac department I seized the opportunity to start a clinic with the specific purpose of finding out how much work an individual with a damaged heart could undertake and the best means for keeping him or her at work My reason for doing this was that when in general practice I had forced on me the importance of the subject, and although for many years I had studied the subject, I found it too big a problem for me to solve

To-day the importance of a knowledge of what amount of effort an individual in impaired health can undertake is realised The State in its hour of necessity has called upon the medical profession to undertake the recruiting of impaired individuals for military work The military medical authorities took up this work utterly unconscious of the fact that they did not possess the necessary knowledge Suppose a man whose life had been spent in navigating boats in a canal was suddenly asked to take charge of a sea going ship Suppose such a man was ignorant of the laws of navigation, and, worse still, did not know that he was ignorant—it requires no prophet to tell that his ship would likely meet with disaster Is there then any need to be surprised that the attempts made by the military authorities met with disaster? Had even the College of Physicians taken charge of the recruiting the same disastrous result would have followed, because the knowledge necessary for the undertaking does not exist

This failure has come about because the teachers of medicine have never properly studied the question, and the reason probably is that they never realised there was such a problem but foolishly thought that their limited experience had given them the necessary knowledge. Many, like Sir Clifford Allbutt, do not realise that a life spent in a narrow sphere has dimmed their vision, so that they can neither appreciate the necessity for other methods nor understand their results I say, with all respect to such an erudite man and eminent clinician, that he has totally failed to grasp the significance of the movement which is gradually beginning to affect the whole field of clinical medicine This is shown in his letter, for it is evident that he has failed to grasp the significance of the principles which should guide the clinical investigator—viz., to search for the mechanism by which a symptom is produced and to find out the effect which the cause of the symptom has on the patient's future Doubtless he fancies such principles trite and commonplace and to have been employed continually by him and his fellows Yet if the matter be looked into it will be found that the old school never really understood their significance nor their application

I could turn to numerous instances in the writings of Sir Clifford Allbutt to demonstrate this but let the following instance suffice In Allbutt and Rolleston's "System of Medicine," vol vi, p 502, discussing irregular action of the heart, he makes the following statement "I once found this kind of intermittence in two brothers who came together to me for life insurance, both of them were very angry with me for refusing them, or rather for stating the facts that led to their refusal" It is manifest from this statement and from the context that he had no idea of the nature of the intermission of the pulse in these cases During the years he had been a hospital physician and a consultant he *must have come across hundreds of these cases*, and yet it never occurred to him that it was necessary to find out how this abnormal sign arose so as to distinguish this particular sign from others that resembled it That is to say, he neglected to take the first step in prognosis—differentiation In rejecting the candidate he gives no reason for doing so, and it is manifest that he could have no accurate knowledge to guide him, so that he falls back on guess work, oblivious of the harm he may do the individual whose medical examination was committed to his care, and oblivious of the harm done to those who read his book and would be guided by his authority

---

[1] THE LANCET August 4th 1917 p 172.

When I say he does not realise the importance of these principles I have enumerated I do so because in his reference to my polygraph work he shows that he has not realised that this is but an infinitesimal part of my work, and that all graphic methods merely help to find out the mechanism by which some sign is produced He has failed to understand not only the methods of my work but the need for these methods Clinical medicine is a large field, and some employ one method and others employ other methods. Sir Clifford Allbutt has studied heart affairs from his point of view, and I have studied them from mine When he tells us as a result of his methods that "kinetic energy lost at each beat equals *3600 n* per hour," or that "eddies change linear into turbulent stream motion," I frankly confess I don't understand him and refrain from criticising When I on my part give the results of my observations he plainly does not understand, but he is not deterred from criticising When, for instance, he criticises my statement that the first sign of heart failure is the sensation produced by a limitation of the heart's power to respond to effort it is at once apparent he does not understand what I have said

When a patient consults a doctor and the doctor detects an abnormal sign in the heart the question that should guide the doctor to a clear issue is, *Does this sign indicate* heart failure or does its presence foreshadow its oncoming? This implies a knowledge of what is heart failure I have read the works of ancient and modern writers to find out what was their conception of heart failure, and though I searched the writings of English, French, and German authors I failed completely to get from any one of them a clear conception of what they meant by heart failure Recognising that this might be due to my stupidity, I asked an able colonial doctor who came to work in my department to look into the matter He wished to follow out a line of investigation, and I suggested to him to study heart failure, but first of all to read up the authorities After three months' careful study he stated that he could not find in a single book an intelligent description of heart failure I have looked through Sir Clifford Allbutt's writings and can find no help in this matter When I began my work in following patients up to see what happened to them I really was on the look out for heart failure I therefore was able in many cases to detect the early signs of heart failure Without exception the very first sign was a sensation indicating a limitation of the field of cardiac response to effort This involved a prolonged inquiry into the nature of the sensations and their differentiation—a field of inquiry of the utmost difficulty It may seem to the superficial observer that to find out whether a man's powers are limited or not is an easy matter, but I found it a very difficult matter, and the first thing I realised was that I was not sufficiently educated to understand the meaning of the symptoms These sensations of exhaustion were so varied, provoked in so many different ways, were simulated by so many other conditions that it took me many years before I saw daylight Sir Clifford Allbutt's remarks upon "effort-tests" are quite beside the mark and show that he has failed completely to comprehend the line of investigation as he has failed to comprehend the significance of the results I have elsewhere explained my view of heart failure, the result of such a patient inquiry that neither Sir Clifford Allbutt nor any of the old school has ever undertaken I do not for one moment say that this view is correct, I merely put it forth as representing a provisional conclusion reached at this stage of investigation

When following out the second of the principles of investigation—finding out what happened to people who showed an abnormal sign—I had necessarily to watch great numbers of people through many years In doing this I observed frequently the onset of heart failure and watched its progress, carefully noting all the signs and symptoms I could detect In doing this my attention was directed to many phenomena which had either been overlooked or neglected It was in the course of this inquiry that I realised the importance of a patient's sensations Now there is a widespread belief that it is the simplest thing in the world to find out a patient's sensations and estimate their value Indeed it is supposed to be so simple that learned authors in treatises on diagnosis barely mention the subject, it being what is called "common knowledge." On the other hand, I found it one of the most difficult matters in the examination of a patient Every genuine sensation has a physical cause in its production, and these sensations have a connexion direct or indirect with the disease from which the patient is suffering In a great many cases they are the only signs of the presence of a disease, so that if we would find out what was the matter with our patient we have to understand the nature of the patient's sensations. Would it be believed that up to recently no serious attempt had ever been made to investigate a patient's sensations! Take, for instance, the simple sensation of an unusual beating of the heart, which the patient may call palpitation. Hitherto the clinician might make a note that the patient had palpitation, unaware that if he understood the meaning of that single sensation he would get the clue to the man's trouble. But no physician in the past had any conception of how to *bring to light the information behind the patient's sensations*, and he did not know how so set about acquiring that knowledge This is how I attempted to get a knowledge. As a general practitioner I had the opportunity on many occasions of seeing patients when they had an attack of what they called palpitation I carried with me a sphygmograph and obtained a record of the pulse during the attack. I carefully inquired of the patient what his sensations were during the time he was suffering from an attack. I found from my *records that the heart acted in a* variety of ways during the palpitation, and as time went on I was able to refer the different ways of acting to different abnormal states. I was able to co-relate the sensations of the patient with these different states, so that now when a patient tells me he has attacks of palpitation I put such questions to him which bring out certain peculiarities which enable me to recognise, in the majority of cases, the nature of the attack and its cause As the causes of palpitation are varied, some directly due to affection of the heart, others due to affections of other organs, and others due to the general state of health, I learnt to differentiate many of them, and was led to detect obscure disease in other organs I cite this as an example of the methods I had to pursue to understand the meaning of each individual sensation, and the reader will surely recognise that in no other way could we get the necessary knowledge But it will be seen before I was able to understand the sensations I had to go through a long preliminary education Now what I did with palpitation I did with other sensations, as the sense of exhaustion, breathlessness, pain, and so forth I was always careful to note the condition of the heart and accompanying phenomena, so that when I describe my view of heart failure it will be understood that my conclusions were not based upon superficial and casual observations

There was another point that came out of this method of investigation—viz, that the onset of disease is first heralded by the patient's sensations Long before physical signs are evident the patient is conscious there is something amiss It follows, then, that if we are ever to be able to recognise the early stages of disease we must be able to interpret the patient's sensations In order to acquire that knowledge we must go through a preliminary education after the fashion I have described in my attempt to understand palpitation When Sir Clifford Allbutt enumerates a number of diseases on which great strides have been made in the knowledge of the early stages, I reply with conviction that this so-called progress is more apparent than real, and that no such progress can take place until the patient's sensations are understood, and towards that end no physician has ever educated himself or been educated to be able to appreciate the significance of a patient's sensations. Take gastric ulcer for instance—a patient's sensations here are the earliest guide. He may have heart burn. What is heartburn? Neither Sir Clifford Allbutt nor any other physician has the remotest idea of the mechanism underlying its production. Or take pain—the elementary knowledge for understanding pain is not yet known to the profession. We even do not know what tissues are capable of producing pain. So long as we are so profoundly ignorant of the meaning of this sensation, so long will we fail to make the slightest progress in our knowledge of the early stages of disease. The man who says we possess sufficient knowledge wilfully shuts his eyes to the light and the truth is not in him.

This leads on to a still more important matter calling loudly for a new conception and practice in the teaching of medicine. What I have said about the patient's sensations being the earliest sign of disease will, I think, scarcely be contested. Now it is the earnest desire of everyone to detect disease at the earliest possible moment, as it is then most amenable to treatment. From what I have said it will be gathered that the recognition of the patient's sensations is the most difficult part of the examination and the knowledge can only be acquired after a great deal of experience and years of study.

Consider the attitude of the hospitals towards this subject. Disease in its earliest and most curable stages, before there is a physical sign, while yet there is but the patient's sensation to tell he is ill, is practically relegated to the out-patient department. Disease when it is so far advanced as to produce a physical sign, which means usually damage to the tissues, and is therefore beyond the stage of cure, is admitted to the hospital wards. I put the matter broadly, though here and there exceptions may be found, but any observing person will admit its truth. To recognise a physical sign is comparatively easy, to recognise the patient's sensations is extremely difficult. To whom does custom allocate the division of work? The easily recognised stage of disease is given to the experienced physician, whereas that stage most hopeful for treatment but where the symptoms are the most difficult of recognition, is handed over to the young and inexperienced junior!

Does not such a glaring anomaly call for a reform? Can the ideas which countenance and permit such a condition of affairs be right? Does it not show clearly that the present-day conception of clinical medicine is altogether wrong, and that a renaissance in medicine is urgently called for?

How is this to come about? I must confess I have no hope whatever in the old school. They have been so long in the bonds of tradition that it is impossible for them to understand a new conception. My hope is in the younger men who are not yet crippled. If the younger teachers will take as their guide this principle: Never teach things which are given you only on authority. Before you teach your students a simple fact verify it from your personal experience or search in the writings of your authorities for their reasons in making a statement. Weigh these reasons carefully and let not the weight of the reputation of the authority affect the balance, but be guided dispassionately by the facts he produces in evidence.

I am, Sir, yours faithfully,

London, August 11th, 1917. J. MACKENZIE.

THE ACTIVITY OF CERTAIN FERMENT PREPARATIONS

To the Editor of THE LANCET.

SIR,—In the course of a research on the coagulation of the blood I was necessary to use various preparations of ferments. Some eight preparations of trypsin, five of papain and two of rennin were tested and found to possess varying degrees of activity. The [illegible] four trypsins were Messrs. [illegible] Pancreatin [illegible] and Pancreatin (solid) and Messrs. Allen and Hanburys' [illegible] Trypsin Co. and [illegible] (solid). All samples of these four extracts were found to be [illegible] active preparations, the different methods of extraction conferring on each special advantages. On the other hand, a solid trypsin bearing a well known American name and purchased from a leading pharmaceutical chemist in London had little activity, while three other specimens of solid trypsins bought locally were practically without tryptic action. Four papain powders, for which large prices were charged, were found to have no digestive activity, and a papaw fruit which was obtained from Durban and arrived in a slightly mouldy condition also proved to be without action when tested. Of the two rennins, one was Messrs. Benger's and was an exceedingly active coagulant of milk, but a tabloid preparation of this ferment, bearing the name of the American firm already referred to in connexion with a trypsin, was found to be inactive. This is remarkable when one remembers how easily a rennin effect is obtained and how many ferments can coagulate milk. The experience, as a whole, shows how necessary it is to test preparations of ferments before assuming that they have the characteristic activity. I learned from one large firm that they had found most papain preparations on the market to be without action, and my own limited experience bears this out.

The research referred to dealt with the coagulation of the blood and was not concerned directly with the estimation of the value of various ferment preparations. It will appear in the *Journal of Physiology*.

I am, Sir, yours faithfully,

August 9th, 1917. W. NEVILL HEARD.

AGGLUTINATION TESTS IN TYPHOID FEVER, ETC.

To the Editor of THE LANCET.

SIR,—May a humble and undistinguished searcher after pathological truth venture to interpose in the agglutination controversy which enlivens your columns from time to time? There can be no doubt that the Oxford School has done valuable service to clinical pathology in pointing out the errors of those who condemn any agglutination method as useless in the diagnosis of the enterica group in these days of T.A.B. inoculations, and of those who maintain that a single positive reaction is diagnostic even in inoculated persons. It has also substantiated the value of the drop-pipette method as against the more tedious volumetric method with graduated pipettes. But there, I am inclined to think, their real service has come to an end. Whether standard agglutinin unit estimation has any future in more exact research work (as Captain Ainley Walker suggests in THE LANCET of Nov. 25th, 1916) I will not judge, but in my opinion it is, for many reasons, unsuitable and unnecessary where a large number of sera have to be tested, and especially as a method for use outside the laboratory. Agglutination tests should be within the scope of every practitioner who wishes to do some at least of his own clinical pathology, but it is obvious he will acquire the simplest technique which will give reliable results. In the laboratory some pathologists habitually turn over all the agglutination work, and even the readings, to an attendant; others prefer to take the responsibility only of their own work. In the laboratory work of a general hospital—at any rate a military hospital—there is no time for ultra elaborate technique. Only the proved unreliability of all other methods could justify the use of the Oxford technique as a general method.

Has the Oxford School proved all other methods to be unreliable? Not at all. After all, the essential point of the Oxford technique—not the only one, but the essential one—is the repeated examination of the patient's serum by the same technique. The personal equation comes in in the reading of "the highest dilution in which marked agglutination (without sedimentation) can be detected" (which is *standard agglutination* according to the Oxford directions) just as in any other method. And when it comes to nine possible readings[1] followed by mathematical calculations from an arbitrary key of values and averages struck from these, then I think the possibility of error must be much increased, and in any case the burden becomes intolerable. This is surely wholly unnecessary. "Agglutinin units" are in danger of becoming a fetish. A rise or fall of agglutinin content is the same whether in units or litre if the same method is used by the same observer, and if the serum dilutions are not too widely separated (which applies to any method) a curve can be plotted out equally well in both cases The important matter is to use the same technique and the same emulsion of known sensitiveness in each case There is no difficulty about this if a good strain of organism is kept properly subcultured and a fresh batch of emulsion made about every two months, such fresh emulsion being tested at intervals against a known high titre serum

---

THE ADMINISTRATION OF EMETINE

To the Editor of THE LANCET

SIR,—Emetine is being utilised so largely in treatment that it may be worth while to draw attention to a better method of administering it than that generally employed at present Since emetine was first advocated by Sir Leonard Rogers in the treatment of amœbic dysentery, it has always been given hypodermically Dixon ("A Manual of Pharmacology," fourth edition) states —

> If ipecacuanha is injected subcutaneously pain and inflammation followed by suppuration and the formation of an abscess are produced at the seat of inoculation The action of cephaeline and emetine is the same as that of ipecacuanha

In actual practice, the subcutaneous injection of emetine and its allied alkaloids does not produce abscesses at the sites of inoculation except in a small percentage of cases There is always, however, great pain, with redness, swelling, and induration, which is often so deep-seated that muscular movement becomes an agony Local tenderness is often very acute, and I have had several cases where the patient refused further emetine injections after the first one or two because of the pain, and I sympathised with them It has also to be remembered that dysentery is sometimes followed by neurasthenia, and the patient is not disinclined in these cases to put the blame for his woes on the emetine

The method of administration that I have adopted and find most satisfactory is intra muscular injection The best sites are on the upper arm over the deltoid and in the gluteal region A prolonged course of treatment can be given in this way without causing any inconvenience to the patient There is no pain and sometimes only a little tenderness at the site of injection 24 hours afterwards Injections can be given on alternate arms day by day Summarised briefly, the advantages of the intra muscular method are as follows 1 Pain during inoculation is limited to the prick of the needle 2 After pain is generally absent, and when present disappears within 24 to 48 hours 3 There is no tenderness, swelling, induration or discolouration of the skin, and scarring is minimal or absent 4 The efficacy of the drug may be increased as there is probably less precipitation through more rapid absorption 5 The same site of inoculation may be used repeatedly at intervals of 48 hours

I am, Sir, yours faithfully,

P FIGDOR, M B Ch.B Glasg,
Temporary Captain, R A M C; Late Temporary Physician to Out patients City of London Hospital for Diseases of the Chest, and Assistant Medical Officer North Eastern Hospital

Lucknow India, July 24th

THE EXPECTATION OF LIFE IN AORTIC REGURGITATION

To the Editor of THE LANCET

SIR,—In his letter to THE LANCET of August 4th Sir Clifford Allbutt, referring to a statement by Sir James Mackenzie that a man with aortic regurgitation may reach his "normal span," exhibits his scepticism of the accuracy of that statement by remarking that were Sir James Mackenzie a writer of less authority he would boldly answer "Never" It seems that the case of longest duration of life from the establishment of an aortic regurgitation which he (Sir Clifford Allbutt) has witnessed was 23 years and that the patient died quite suddenly at the age of 55 It may therefore be of interest to your readers to know that I am now in attendance on a lady who is 72 years of age, and has in all probability had aortic regurgitation for the last 50 or 60 years She had a mild attack of rheumatic fever at the age of 14, and a second, which she describes as a bad attack, at the age of 18 She was then under the care of the late Dr Robinson, of Newbury, who informed her of the fact that she had a weak heart," a statement which was subsequently confirmed by the late Dr Wilks, of Ryde, Isle of Wight, "40 years or more ago" For the last 10 years she has been under the care of my partner, Dr W H Fawcett, who has observed the condition of the heart on many occasions, and who is thus able to confirm the diagnosis of aortic regurgitation, a condition which has led to only a very moderate degree of hypertrophy and dilatation of the left ventricle, and which has given rise to no symptoms other than occasional attacks of giddiness and faintness I might add that the only other illness from which the patient has suffered was an attack of diphtheria at the age of 22, but, as Sir William Osler remarks, "Simple endocarditis in diphtheria is rare," whilst in rheumatic fever it is exceedingly common She probably owes the immunity which she has enjoyed hitherto to the fact that she has remained single, and has never been obliged to undertake any hard physical exertion Needless to say, I look upon this case as the exception which proves the rule, and the rule is too well known to need reiteration

I am, Sir, yours faithfully,

J STANLEY AVERY

Bournemouth, August 8th, 1917

URBAN VITAL STATISTICS

(Week ended August 4th, 1917)

English and Welsh Towns —In the 96 English and Welsh towns, with an aggregate civil population estimated at nearly 17 000,000 persons, the annual rate of mortality was 10 3 per 1000 which is 0·9 per 1000 less than that recorded in the previous week In London, with a population exceeding 4 000 000 persons the death rate was 10 3, or 0·1 per 1000 below that in the previous week among the remaining towns the death rates ranged from 3 9 in Ilford 4 4 in Enfield and in Great Yarmouth and 5·2 in Grimsby to 15·7 in Blackpool, 16·8 in Carlisle, 17 3 in Rotherham and 17 5 in Southampton The principal epidemic diseases caused 287 deaths which corresponded to an annual rate of 0·9 per 1000 and included 107 from infantile diarrhœa, 95 from measles, 39 from diphtheria 37 from whooping-cough, 4 from scarlet fever, and 5 from enteric fever The deaths from diarrhœa were 12 above the number in the previous week and included 28 in London 13 in Liverpool 11 in Manchester and 10 in Birmingham. Measles caused the highest death rates of 2 4 in Northampton and 2·7 in York The 625 cases of scarlet fever under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital were 25 fewer than the number in the previous week; the 1111 cases of diphtheria showed an increase of 30 Of the 3357 deaths from all causes in the 96 towns 133 resulted from violence The causes of 29 deaths were uncertified of which 7 were registered in Birmingham, 6 in Liverpool, and 2 each in Warrington Barrow in Furness and Gateshead.

Scotch Towns —In the 16 largest Scotch towns, with an aggregate population estimated at nearly 2,500,000 persons, the annual death-rate was 10 8 against 12 5 and 12·9 per 1000 in the two preceding weeks The 240 deaths in Glasgow corresponded to an annual rate of 11 2 per 1000 and included 14 from whooping-cough 8 from infantile diarrhœa and 6 from measles The 75 deaths in Edinburgh were equal to a rate of 11·5, and included 2 from measles and 1 each from whooping cough, diphtheria, and infantile diarrhœa.

Irish Towns —The 113 deaths in Dublin corresponded to an annual rate of 14 8 or the same as the rate in the previous week and included 14 from infantile diarrhœa 2 from whooping-cough, and 1 from enteric fever The 84 deaths in Belfast were equal to a rate of 11 1 per 1000 and included 2 from infantile diarrhœa, and 1 each measles and whooping-cough

(Week ended August 11th 1917)

English and Welsh Towns —In the 96 English and Welsh towns, with an aggregate civil population estimated at nearly 17 000,000 persons, the annual rate of mortality was 10 4 per 1000 and was 0·1 more than that in the previous week In London with a population exceeding 4 000 000 persons the death rate was 10 3, and coincided with that recorded in the previous week among the remaining towns the death rates ranged from 4 1 in Walthamstow 4 4 in Barrow in Furness 4·9 in Willesden, and 5·5 in Wakefield to 16 1 in Dewsbury 16 7 in Dudley 17·6 in Oxford and 17 7 in Hastings The principal epidemic diseases caused 328 deaths which corresponded to an annual rate of 1·0 per 1000 and included 180 from infantile diarrhœa, 78 from measles, 31 from whooping-cough 29 from diphtheria, 6 from scarlet fever and 4 from enteric fever The deaths from diarrhœa were 221 in excess of the number in the previous week and included 67 in London 16 in Liverpool, 10 in Manchester 9 in Birmingham and 8 in West Ham Measles caused the highest rates of 2·7 in Stockton-on Tees and 3·6 in Northampton The 633 cases of scarlet fever under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital were 8 above the number remaining at the end of the previous week the 1071 cases of diphtheria showed a decrease of 40 Of the 3394 deaths from all causes in the 96 towns 111 resulted from violence. The causes of 29 of the deaths were uncertified of which 6 were registered in Birmingham 4 in Liverpool, 3 in St. Helens, and 2 each in Leicester and Manchester

Scotch Towns —In the 16 largest Scotch towns with an aggregate population estimated at nearly 2,500,000 persons, the annual rate was 11 2, against 12 9 and 10 8 per 1000 in the two preceding weeks The 242 deaths in Glasgow corresponded to an annual rate of 11 3 per 1000, and included 17 from infantile diarrhœa 9 from whooping-cough and 7 from measles. The 71 deaths in Edinburgh were equal to a rate of 11 2 per 1000 and included 1 each from whooping-cough and infantile diarrhœa

Irish Towns —The 115 deaths in Dublin corresponded to an annual rate of 15·0 per 1000 and included 18 from infantile diarrhœa 2 from diphtheria and 1 each from measles and whooping cough The 88 deaths in Belfast were equal to a rate of 11 7 per 1000, and included 1 each from measles whooping cough and infantile diarrhœa

The War.

THE CASUALTY LIST

THE following names of medical officers appear among the casualties announced since our last issue —

Killed

Capt H A. Harris, R.A M C, attached Royal Field Artillery, was educated at Cambridge and at St Bartholomew's Hospital London, and qualified in 1910 He was in practice at Putney, London, prior to joining the R.A.M C

Capt A S Taylor, R.A.M C attached Highland Light Infantry, qualified at Edinburgh in July, 1914, and joined the R A.M C soon after the outbreak of war

Capt B M Hunter, R A.M C, attached Cambridge Regiment qualified at Glasgow in 1909, and for a time practised at Consett Co Durham, and afterwards at Stevenston, Ayrshire

Capt W R Aspinall, M C, Australian Army Medical Corps

Major W D Kirkland, M.C, Australian Army Medical Corps

Surgeon Probationer A. M Horsey, R N V R

Died of Wounds

Capt R W Shegog, R A.M C, qualified at Dublin in July, 1915, and joined up shortly afterwards

Capt N G Chavasse V C, M C R.A.M C, attached to the Liverpool Regiment was educated at Oxford and at Liverpool University, and qualified in 1912 He was a well known athlete at Oxford and prior to the war he was medical officer at the Royal Southern Hospital, Liverpool The award of the M C was recorded in THE LANCET of Jan 22nd, 1916 p 215 and of the V C in THE LANCET of Nov 4th 1916, p 805

Died

Fleet Surg E C Ward R N, was educated at Queen's College, Cork and at Edinburgh University, and qualified in 1853 He died at the Royal Naval Hospital, Chatham

Wounded

Capt W B Allen V C M C R A.M C

Capt H P Partridge, M C R A M C

Lieut D S Pracy R A M C, attached Liverpool Regiment

Capt H Robinson, R A M C attached Liverpool Regiment

Capt T D Renwick R.A M C

Capt D D Craig M C R A M C attached E Lancs Regt

Capt W F David M C, R A M C, attached Cameron Highlanders

Capt E Evans R.A M C

Lieut G L Gall R A M C

Capt D McVickers R A.M C, attached Coldstream Guards

Capt J Ross R A M C attached King's Royal Rifle Corps

Capt F B Chavasse R A M C attached Liverpool Regiment

Capt F S Fletcher R A M C

Capt I C MacLean M C, R A M C attached Rifle Brigade

Capt G C Robinson R A M C attached Liverpool Regt

Capt J Warwick R A M C attached Liverpool Regiment

Capt C W Treherne R.A M C

Capt I P Charles, R A M C attached Herts Regiment

Capt W S Wallace R A M C

Missing

Lieut J Rickards, R A M C attached Royal Scots

CASUALTIES AMONG THE SONS OF MEDICAL MEN

The following additional casualties among the sons of medical men are reported —

Capt P F C d E Wheeler Dorset Regt attached to the Royal Flying Corps killed whilst flying in England eldest son of Capt P C F d E Wheeler R A M C of Worthing

Second Lieut T M O'Neill Royal Flying Corps severely injured whilst flying in France son of the late Dr H O'Neill J P of Belfast

Capt J F Swain Royal Garrison Artillery killed in action, eldest son of Dr W L Swain of Wimbledon hill London and formerly of São Paulo Brazil

Capt H Chronnell M C Loyal North Lancs Regiment killed in action only son of Dr J Chronnell of Hindley, Lancs

Second Lieut W F Francis Hertfordshire Regiment killed in action third son of Dr L A Francis of Uxbridge Middlesex

Second Lieut J J F Shand Royal Garrison Artillery killed in action only son of Fleet Surgeon J Shand R N

Second Lieut A H V Beatty Manchester Regiment killed in action eldest son of Dr T B H Beatty of Harrow Middlesex

OBITUARY OF THE WAR

EDWARD RAYNER, M.B, B C CAMB F R C S ENG

SURGEON ROYAL NAVY

Surgeon E Rayner, who was killed in the explosion which destroyed the *Vanguard*, aged 31 years, was elder son of the late Edward Rayner of Wadhurst Sussex Educated at Heddon Court and the South Eastern College, Ramsgate, at both of which he was conspicuous in sports he entered Pembroke College Cambridge taking a first-class in the Natural Science Tripos in 1908 and completing his medical studies at St Thomas's Hospital After taking his M B B C Camb, in 1912 he acted as house surgeon and casualty officer at his hospital while working for the F R C S When war broke out he offered his services to the Admiralty and was sent to Gallipoli with the R N Divisional Engineers He saw the campaign through from start to finish suffering himself from epidemic jaundice and becoming seriously ill after the evacuation Last autumn, after his recovery he was appointed surgeon to the *Vanguard*, where he remained until his death

A consulting surgeon with the armies writes of Surgeon Rayner I knew him well and had a high opinion of his ability and sound surgical judgment I heard from various sources of his fearless and devoted conduct ' Others speak of his cheery outlook on life—one who never complained of the monotonous life on board a battleship but was always an excellent messmate and companion

MARIAN ELIZABETH WILSON, M B, CH B EDIN

SURGEON TO THE SCOTTISH WOMEN'S HOSPITAL AT ROYAUMONT

Dr Marian Wilson who died on August 1st, was surgeon to the Scottish Women's Hospital Hopital Auxiliaire 301 Royaumont France Her death was due to an attack of acute appendicitis occurring at St Martin Vésubie Alpes Maritimes where she was taking a few weeks rest Miss Wilson belonged to a Scottish family, studying medicine at Edinburgh where she graduated in 1906 After holding the post of medical officer to York Dispensary she spent several years in Palestine as a medical missionary at Jaffa and Hebron On the outbreak of hostilities Miss Wilson went to Lausanne where she had already lived for several years thus acquiring a complete mastery of the French language and in November 1915 she joined the staff of the Royaumont hospital where her surgical experience and conscientious work made her a most valuable colleague Her devoted services to the French wounded were recognised in February 1917 when the French Government awarded her the Médaille des Epidémies en vermeil.

Her chief at the Royaumont hospital writes of Miss Wilson 'Her personal charm and her solicitude for her patients gained her their affection in an unusual degree and after their return to the front they not infrequently walked many miles and spent many hours of their short leave in paying her a visit In spite of a frail physique, with an admirable spirit Miss Wilson rose to the occasion during many periods of stress and fatigue The news of her untimely death has caused the deepest sorrow to her friends and comrades, in whose ranks her loss has created an irreparable gap "

THE HONOURS LIST

The following awards to and promotions of, medical officers are announced —

Distinguished Service Order

Staff Surgeon Gilbert Bodley Scott, R N

In recognition of his services with a Naval Armoured Car Squadron in France Russia Turkey and Roumania On active service he has shown a devotion to duty and a forgetfulness of self which cannot be too highly praised

THE CENTRAL MEDICAL WAR COMMITTEE AND THE COMMITTEE OF REFERENCE OF THE ENGLISH ROYAL COLLEGES

The Forthcoming Committee of Inquiry into the Working of the Army Medical Service

The following resolution was passed by the Central Medical War Committee on August 15th, 1917, for transmission to the Prime Minister, the Secretary of the War Cabinet, the Secretary of State for War, and the Director General of the Army Medical Service —

> The Central Medical War Committee understands from reports of the proceedings in Parliament that the Government has in contemplation the appointment of a small Committee of Inquiry into the practical working of the Army Medical Service in the field The Committee welcomes this announcement believing from statements made to it that such an inquiry is certainly advisable and is calculated to allay much unrest. The Committee trusts however that the inquiry will be extended to include the working of the Service in this country The Committee suggests that in view of the difficulty of supplying from the civil community more doctors for the Army the reference to the Committee of Inquiry should include the duty of instituting a careful comparison between the medical needs of the civil community and the Army respectively The Central Medical War Committee would venture to urge that, in view of the responsibility which has rested on it of selecting from civil practice the bulk of the doctors now serving in the Army the Committee of Inquiry should include representatives of the Central Medical War Committee.

The Constitution of Recruiting Boards

The constitution of recruiting boards and the future requirements of the civil and military medical services were the subjects debated by a special joint meeting of the Central Medical War Committee and the Committee of Reference of the English Royal Colleges on the same day A report of the joint committee upon the constitution of these boards was submitted, which assumed that whatever Government Bureau became the authority the whole organisation of recruiting for the Army would be handed over to a civil department, and which laid stress on the importance of providing that the personnel of the medical recruiting boards should consist of doctors whose position and experience gave some assurance that the medical examinations were conducted in an efficient and uniform manner The meeting decided that the report and the scheme, which is a most carefully thought-out document, should be sent to the Prime Minister, the War Office, the Local Government Board, the National Insurance Commission, and the Chairman of the Select Committee of the House of Commons now taking evidence about recruiting

PERMANENT COMMISSIONS IN THE R.A.M.C

WE have received a letter from a correspondent signing himself "Pater," criticising the present system of granting commissions in the R A.M C Born and bred himself in the old Army Medical Department his eldest son entered the profession with the hope of following in his father's and grandfather's footsteps The letter goes on —

> He became qualified from my old hospital in September, 1914, and in the ordinary course of events would have entered for the R A M C examination in November of that year, hoping thus to make a good start when young He was told then that the examination for commissions in the R.A.M C was suspended, and that his only way of entering the Service was by accepting a commission in the Special Reserve This he did and has been serving with a Field Ambulance in France for over two years now with the rank of Captain. He has repeatedly tried to obtain a regular Commission but so far without success I have written more than once to the War Office explaining the circumstances but the reply has always been that no commissions are being given in the ordinary way during the war And yet commissions *are* being given. It really appears to come to this, that during the war the old system of examination has been superseded by a system of selection in which of course interest of all sorts is bound to have weight. But it seems rather hard that a young man who had from his school days devoted all his energy to entering the R.A.M.C and might have gained his commission by examination three years ago should still be waiting *and losing seniority* because he joined up at once in the only possible way and has been on active service ever since

Our correspondent's disappointment will, we feel sure, meet with a sympathetic hearing, but it is not in our experience that interest is now the chief factor in securing regular commissions A fair number of young officers have been selected for permanent commissions on the grounds of work, age, and other objective considerations The number is, however, greatly larger from which selection has to be made, and individual disappointment can hardly be avoided

ANKYLOSTOMA IN THE AMERICAN ARMY

IN the *Military Surgeon* (Washington, D C) for July is an interesting paper by Major J F Siler and Major C L Cole, both of the Medical Corps of the United States Army, on the prevalence of ankylostoma in one cavalry and two infantry regiments from the Southern States The fæces of 2704 soldiers were examined A dozen bowls were issued. In each was placed a square of glazed paper On this the fæces were deposited, and with a small spoon attached to the cork, which stoppered a glass tube, a specimen was taken, and returned to the glass tube on which was written the name of the soldier The glazed paper, with the fæces on it, was caught up by its four corners and dropped into the latrine trench The fæces were microscopically examined If the first slide proved negative, a second was examined This very neat method greatly facilitated the valuable research these officers made, for they could do up to 250 examinations in a day They found that a Texas infantry regiment had 6 per cent infected and an infantry regiment from Mississippi 32, while in a cavalry regiment from Alabama 54 per cent of the personnel were harbouring the ankylostoma It is concluded that the cases in the Texas regiment had come from outside the State, and that the others had probably incurred infection at home The parasite was more often found in men from rural districts Nothing is said about the condition of these men as regards anæmia, or of any evidence of the disease they presented to the naked eye, but it was found that the two regiments most affected were the two mentioned in the *Military Surgeon* for June[1] as suffering exceptionally from measles through want of patient precaution Perhaps their neglect of sanitary precaution was due to the helminthiasis and its consequent anæmia having reduced the moral energy of these commands At any rate in these two regiments the men who had hookworms were attacked by measles twice as numerously as the others, and also suffered far more from complications This is an observation of great importance, for it gives statistical support to the popular impression that liability to infectious disease is greater for contacts already out of health If all United States Southern troops are similarly affected with ankylostoma they will be an anxiety to any country in which they go campaigning, and the greatest care must be taken in disposing of their excreta.

THE SUPPLY OF MEDICAL MEN IN NEW ZEALAND

A New Zealand Special Correspondent writes New Zealand, in common with the Old Country and the other oversea dominions has been since the beginning of the war exercised as how best to use the medical men practising in the dominion. A large number of men volunteered at the outset of the war and, alas many have been killed The desire of the doctor to get to the front and to help in the great struggle has brought about hardship in some of the country districts and quite recently the Government has undertaken the task of allotment of medical material between the military authorities and the civil population

The National Efficiency Board here has classed the medical profession as one of the most essential of occupations Already out of 723 men on the Register at the beginning of the war 257 are on military service at home or abroad. Among the recommendations made were the following —

> That a board be set up of representative medical men from all the Dominion to hear all appeals against military service made by medical men and to make recommendations to the Government
>
> That the services of any applicant for registration under the Medical Acts should be placed first at the disposal of the Defence Minister and if not needed by him then at that of the Health Department, and that agreement to such disposal should be a condition of registration
>
> That during the war men should not be allowed to change their location

The Minister proposes to introduce an Act of Parliament to give power to the Government to mobilise the whole profession so that they may be sent to any part of the Dominion which the Minister of Public Health may think fit This is regarded as being unfair to the profession, in that no other trade or calling has up to now, been mobilised for *home service* There is no doubt that in some of the outlying districts there is a scarcity of medical men but this scarcity has obtained for long before the war and the Government has been in the habit of offering premiums to men to settle in these places It is suggested by the medical profession that the Government should extend this system and grant say an honorarium of £560 (captain s pay) per annum with travelling allowances Where a medical man is called up by a ballot from a district that would be unduly denuded of medical help if he went into camp his place might be taken by a man from a better supplied centre At one of the recent sittings of the Military Appeal Boards the inspector of hospitals appeared in support of an appeal for exemption by a medical man in one of the country districts Asked by the military assessor "May we take it that you will appeal whenever you think that the safety of the outlying places is likely to be jeopardised by the doctor being take from the district ' Yes ' And if you do not appear we may take it that the man can be spared ? 'Yes It would seem from this that agreement between the medical profession and the Government has in a measure been anticipated but it is to be hoped that the *pourparlers* which are taking place will result in a way that will at once be fair to the country and the profession

DOCTORS OF MILITARY AGE —The Local Government Board of Ireland has now sanctioned doctors of military age for civil work in the sanitary service and the appointment of Dr D F Murnaghan as temporary medical officer of Omagh No 11 Dispensary District is allowed at a rate of payment of 4 guineas weekly

NOTES ON CURRENT TOPICS

Sir W Watson Cheyne

SIR W WATSON CHEYNE took his seat in the House of Commons on Monday, August 13th, as Member for the Universities of Edinburgh and St. Andrews

Select Committee on Medical Examinations

Mr MACPHERSON, Under Secretary for War, appeared as a witness on Thursday, August 9th, before the Select Committee of the House of Commons, which is inquiring into medical examinations and re examinations for the Army in particular under the Military Service (Review of Exceptions) Act, 1917 Mr SHORTT was in the chair

Mr MACPHERSON stated that he had held the office of Under Secretary since December last He had assured the House of Commons on more than one occasion that no secret instructions had been issued with regard to the number of rejections of recruits He had on those occasions addressed inquiries on the subject to a department at the War Office, which obtained the requisite details, and he had to rely on that department He was assured that no instructions oral or other, were issued except under Army Council instructions

The CHAIRMAN You have undoubtedly read the secret instructions?

Mr MACPHERSON I have since this Committee began its sittings I first saw the confidential letter sent out by General Sir Alfred Keogh in print It was not based on an Army Council instruction It was a confidential document sent out by Sir Alfred Keogh, acting, no doubt, upon some instructions or other I never heard of the document before I saw it in print Such a document would not come before the civilian side of the War Office The facts on which he based his replies in the House of Commons were invariably signed by the head of the department concerned He was entitled to assume that the information had been got from the proper department

The CHAIRMAN If you had known that this document existed would you have given the same answer?

Mr MACPHERSON admitted that he would not He would not assent to the proposition that he had been misled It all depended on the view which the military authorities took They distinguished between a secret document and a confidential document The instructions sent out to heads of departments were not looked upon by the military as secret instructions A department had a perfect right to send out any instructions it liked so long as they dealt with the work of the department

Mr NIELD I understand that your replies given in the House are based on facts supplied by the departments, you wording them in your own phraseology?

Mr MACPHERSON That is so

Mr REES To the military mind secret instructions would only have regard to Army Council instructions?

Mr MACPHERSON I think so

Education and the Health of School Children

In his speech in introducing the Education Bill for England and Wales on Friday August 10th Mr HERBERT FISHER (President of the Board of Education) made striking reference to the need of conserving the health of school children and young persons and of promoting their physical efficiency The Bill is a comprehensive measure It proposes, amongst other matters to encourage the establishment of nursery schools to abolish all exemptions from school attendance up to the age of 14, to insist upon attendance at continuation day classes up to the age of 18 when full time education has not been received up to the age of 16 Dealing with the regulation of child labour, Mr FISHER said We desire a full period of school life unimpaired by the competing claims of employment for all children of the working population At the present moment the effect of our elementary school education is greatly harmed by the work which is imposed on children out of school hours They are liable to be employed for three hours before the school opens and for some hours after the school closes, and the general opinion of my inspectors is that of all the reforms affecting elementary education there is none more vital than the enforcement of strict limitation of the employment of children in their school going days This is not merely a question of scholastic efficiency It affects the physical welfare of the race We have now an overwhelming mass of evidence to the effect that the health of our children suffers from premature or excessive employment. You may trace the evil effects in diminished height and weight in curvature of the spine in cardiac affections, and in deficiency of the senses especially the sense of vision and in the bad dentition of our working classes The reports of our school medical service are full and spent many hours of their short leave in paying her a visit In spite of a frail physique, with an admirable spirit Miss Wilson rose to the occasion during many periods of stress and fatigue The news of her untimely death has caused the deepest sorrow to her friends and comrades, in whose ranks her loss has created an irreparable gap '

NOTES ON CURRENT TOPICS

Sir W Watson Cheyne

Sir W WATSON CHEYNE took his seat in the House of Commons on Monday, August 13th, as Member for the Universities of Edinburgh and St. Andrews

Select Committee on Medical Examinations

Mr MACPHERSON, Under Secretary for War, appeared as a witness on Thursday, August 9th, before the Select Committee of the House of Commons, which is inquiring into medical examinations and re examinations for the Army in particular under the Military Service (Review of Exceptions) Act, 1917 Mr SHORTT was in the chair

Mr MACPHERSON stated that he had held the office of Under Secretary since December last He had assured the House of Commons on more than one occasion that no secret instructions had been issued with regard to the number of rejections of recruits He had on those occasions addressed inquiries on the subject to a department at the War Office, which obtained the requisite details, and he had to rely on that department He was assured that no instructions, oral or other, were issued except under Army Council instructions

The CHAIRMAN You have undoubtedly read the secret instructions?

Mr MACPHERSON I have since this Committee began its sittings I first saw the confidential letter sent out by General Sir Alfred Keogh in print It was not based on an Army Council instruction It was a confidential document sent out by Sir Alfred Keogh, acting, no doubt, upon some instructions or other I never heard of the document before I saw it in print Such a document would not come before the civilian side of the War Office The facts on which he based his replies in the House of Commons were invariably signed by the head of the department concerned He was entitled to assume that the information had been got from the proper department

The CHAIRMAN If you had known that this document existed would you have given the same answer?

Mr MACPHERSON admitted that he would not He would not assent to the proposition that he had been misled It all depended on the view which the military authorities took They distinguished between a secret document and a confidential document The instructions sent out to heads of departments were not looked upon by the military as secret instructions A department had a perfect right to send out any instructions it liked so long as they dealt with the work of the department

Mr NIELD I understand that your replies given in the House are based on facts supplied by the departments, you wording them in your own phraseology?

Mr MACPHERSON That is so

Mr REES To the military mind secret instructions would only have regard to Army Council instructions?

Mr MACPHERSON I think so

Education and the Health of School Children

In his speech in introducing the Education Bill for England and Wales on Friday August 10th Mr HERBERT FISHER (President of the Board of Education) made striking reference to the need of conserving the health of school children and young persons and of promoting their physical efficiency The Bill is a comprehensive measure It proposes, amongst other matters, to encourage the establishment of nursery schools, to abolish all exemptions from school attendance up to the age of 14, to insist upon attendance at continuation day classes up to the age of 18 when full time education has not been received up to the age of 16 Dealing with the regulation of child labour, Mr FISHER said We desire a full period of school life unimpaired by the competing claims of employment for all children of the working population At the present moment the effect of our elementary school education is greatly harmed by the work which is imposed on children out of school hours They are liable to be employed for three hours before the school opens and for some hours after the school closes, and the general opinion of my inspectors is that of all the reforms affecting elementary education there is none more vital than the enforcement of strict limitation of the employment of children in their school going days This is not merely a question of scholastic efficiency It affects the physical welfare of the race We have now an overwhelming mass of evidence to the effect that the health of our children suffers from premature or excessive employment You may trace the evil effects in diminished height and weight, in curvature of the spine in cardiac affections and in deficiency of the senses, especially the sense of vision, and in the bad dentition of our working classes The reports of our school medical service are full of them Accordingly, we propose that no child under 12 shall be employed for profit, and here we have already been anticipated by bylaws passed in some of our large municipalities, and we further provide that no child under 14 shall be employed on any day on which he is required to attend school before the close of school hours or after 8 P M on that day, and on other days before 6 A.M or after 8 P M The House will observe that under this provision a child between 12 and 14 may be employed between 6 A M and 8 P M on Saturdays and during school holidays and although we have come to the conclusion that there is something to be said for a little employment on days on which the school provides no regular work, we are fully sensible that this liberty may be abused in the future as it has been in the past, and the Bill accordingly provides that the local education authorities, if they are satisfied, on the report of the school medical officer or otherwise, that the child is being employed in such a way as to be prejudicial to health or education, may forbid or regulate that employment We have also come to the conclusion that if the local education authority should decide that it would be wise to continue the elementary education in elementary schools either of the boys or the girls in their area or of boys or girls following particular occupations in that area, up to the age of 15, they shall be empowered to do so

In regard to physical training, the right honourable gentleman said The Government is desirous of taking this opportunity of assisting the physical education of the people in every possible way Physical training is already an element, although perhaps not a sufficient element, in our elementary school curriculum, and grants have recently been sanctioned for organisers of physical training in our public elementary schools The present Bill gives physical training a place in our continuation schools Every boy and girl in those schools will receive physical training It goes even further It empowers the local education authority to establish nursery schools for young children, to maintain playing fields, school baths or school game centres, and equipment for physical training, and it extends the powers and duties with regard to medical inspection now possessed by the local education authorities in the case of elementary schools and secondary schools under their control Let us consider what this means to a girl drawn from a slum in one of our great manufacturing towns She will be under the continued inspection and supervision of the School Medical Service She will have the advantage of physical exercise and remedial training as well as the practical training, which will be part of the work of the continuation schools

Colonel YATE Is physical training provided for in the continuation school for boys?

Mr FISHER Certainly The right honourable gentleman proceeded to deal with the other details of the Bill The State, he said, had need to secure for its juvenile population conditions under which mind, body, and character might be harmoniously developed

Welfare of the Blind

The Departmental Committee on the Welfare of the Blind has issued its report It states that the intervention of the State is required to secure (1) central control, organisation, and assistance for the existing agencies of voluntary help, which could be utilised with far greater effect if centrally directed, and (2) additional assistance for the blind It is recommended that a general department whose function shall be the general care and supervision of the blind shall be set up in the Ministry of Health whenever such a Ministry shall be created, and that in the meantime it shall be set up in the Local Government Board The report also recommends that steps should be taken to assure uniform and more effectual notification of the disease of ophthalmia neonatorum, and that immediate treatment of all cases should be secured

---

HOUSE OF COMMONS

WEDNESDAY, AUGUST 8TH

Sir William Babtie

MAJOR DAVID DAVIES asked the Under Secretary for War whether the contents of the Vincent-Bingley Report of the Mesopotamia Expedition had been considered by the Army Council before the appointment of Sir William Babtie as Deputy Director General of Army Medical Services, and, if so, what reasons could be given for his selection for this post—Mr MACPHERSON replied Sir William Babtie was appointed Director of Medical Services, and not, as stated in the question, Deputy Director General Medical Service, at the War Office on March 18th 1916 The Vincent-Bingley report is dated "Simla, 29th June, 1916"

Mr HOGGE Does he retain his Indian pay?—Mr MACPHERSON All that I can say is that the War Office has suspended him On the question of his pay I refer the honourable Member to the India Office

The Army Medical Service

SIR GARROD THOMAS asked the Under Secretary for War whether he would state what salary was paid to members of the Medical Advisory Board of the Army Medical Service how many civilian doctors had a seat on it and how many times this Board had sat since August, 1914—Mr MACPHERSON answered There are 11 members, seven military and four civilian The civilian members are paid £200 a year each for their services on the Board Two military members receive extra pay of £150 a year and five receive nothing for this duty The number of meetings of the board was in 1913 ten and in 1914 seven No formal meetings have been held since August, 1914, but all the paid members have been constantly consulted and have given very valuable advice through the war

Mr PRINGLE Is it not advisable to have the opinions of these men in concert as a council as they were intended to be?—Mr MACPHERSON I am informed that most of these members are serving in various theatres of war

Sir GARROD THOMAS asked whether the honourable gentleman was aware that, although the number of civilian doctors now in the Army Medical Service outnumbered members of the regular Royal Army Medical Corps by more than ten to one, the civil doctors held none of the higher administrative posts which would give them power to introduce reforms or otherwise increase the efficiency of the Army Medical Service, and whether he would consider the desirability of taking action in this direction—Mr MACPHERSON replied At the present moment there are a large number of consultant medical men of the highest attainments employed both at home and abroad with the Army, and these distinguished men are in constant touch with the Army medical authorities with a view to introducing reforms and increasing the efficiency of the Army Medical Service in such ways as experience may prove beneficial Territorial and Reserve medical officers and civilians who have been granted commissions in the Royal Army Medical Corps during the war hold a fair share of the administrative posts in the Army Throughout the war the line that has been invariably taken is that the best man should be employed where his abilities had the most scope, but it must be remembered however eminent a civilian medical man's attainments may be, he would be out of place in certain high administrative posts in the Army through his want of knowledge of the administration and organisation of the Army as a whole Where this experience has been gained through service during the war these officers are equally available with Regular medical officers to posts of responsibility The whole subject has recently been under investigation by a Committee, the report of which may be shortly expected

Sir GARROD THOMAS asked whether the honourable gentleman was aware that owing to the uneconomical use of medical men by the Army Medical Service a number of hospitals in this country were understaffed that the supply of medical men to the civilian population was such that they could not hope to cope with a serious epidemic, that owing to this shortage a number of resident posts in hospitals had been filled by unqualified medical students, Chinese, Indian, and other coloured doctors, and that in many instances His Majesty's soldiers and their relations, including women during childbirth, depended largely on these for medical assistance, and whether he proposed to take any action in the matter—Mr MACPHERSON said in reply I would refer my honourable friend to answers which I have already given on this subject There is a committee in existence to safeguard the needs of the civilian population so far as medical men are concerned I may add that the Secretary of State is contemplating the appointment of a small committee to consider the use which is being made of medical men in France

Medical Equipment and Indian Troops

Mr MONTAGU (Secretary for India) informed Mr KING that the future scale of medical equipment for Indian troops was under the consideration of the Indian Government

Declarations under the Vaccination Act

Answering Mr SNOWDEN Mr HAYES FISHER (President of the Local Government Board) stated that the figures in regard to vaccination for 1915 were as follows declarations of conscientious objectors 293 315, births, 814 537, primary vaccinations, 375,330 The information for 1916 was not yet available

In reply to Mr WILKIE, Mr MUNRO (Secretary for Scotland) stated that the following were the figures in regard to vaccination in Scotland —

	1914	1915
Declarations of conscientious objection to vaccination	38,673	35,231
Births registered	123 934	114,181
Children vaccinated	63 433	61,456

Housing in Scotland

Mr MUNRO informed Mr DUNCAN MILLAR that the report of the Scottish Housing Commission was expected to be finished by the end of this month

In Committee of Supply on the note for the Local Government Board for Scotland, Mr DUNCAN MILLAR drew attention to the need for further housing accommodation in Scotland

In the West of Scotland particularly in the middle ward of Lanarkshire, the conditions of housing were very serious indeed and in fact, at present they constituted a serious menace to public health

Mr T B MORISON (Solicitor General for Scotland) replied that it was impossible to go into the details of housing policy for Scotland until the report of the Housing Commission had been received and considered That report, he understood, would deal not merely with city problems but also with problems which specially bore on certain country districts as well as upon those engaged in the fishing industry It would further deal with the compulsory acquisition of land by local or other authorities The most valuable portions of the report would be the recommendation of the provision of funds for carrying out a scheme of that kind a proportion of the cost to be borne by the State and a proportion to be borne by the local authorities In the meantime the Government had not been idle in regard to making preparations for dealing with the housing question in its general aspect Deputations had been received by the Secretary for Scotland and the matter had been before the Cabinet who had come to the decision that it was necessary to afford substantial financial assistance from the public funds to local authorities who were prepared to provide houses for the working classes and for those engaged in work connected with the war He thought a circular[1] had just been issued by the Local Government Board for Scotland from Edinburgh to the local authorities in which they were asked what their requirements were and the amounts necessary for their various districts, and the Local Government Board hoped that by Oct 15th they would be in possession of all the facts which were material to this matter

THURSDAY, AUGUST 9TH

Neurasthenic Cases in the Service

Answering Mr KING, Mr BARNES (Minister of Pensions) said There are 50 members of the Special Medical Board dealing with neurasthenic cases The board sits at Lancaster Gate daily and at numerous centres in the provinces once in three weeks or more frequently if necessary The fact of a man's discharge has been approved by the board is an absolute exemption under the Review of Exceptions Act The board have of course, the power to refuse discharge, but that power is exercised sparingly They have refused 50 cases out of 5000 They have no power to compel a man to re-enter the Army who has been discharged and they are always glad to have and frequently apply for, the opinion of medical men acquainted with the patient's previous history

MONDAY AUGUST 13TH

Medical Examinations in the Army

Mr HOGGE asked the Prime Minister whether he had observed in the Report of the Select Committee on the Military Service (Review of Exceptions) Act that in spite of the Army Council instruction issued by him when he was Secretary for War secret instructions were issued by officials under his control which destroyed the value of his own instructions, and whether he intended to take any disciplinary action —Mr MACPHERSON (Under Secretary for War), who replied, said My noble friend the Secretary of State for War declines to accept the description of this incident in the terms of my honourable friend's question and is not prepared to regard it as calling for any disciplinary action As a matter of fact the letter referred to was issued by Sir Alfred Keogh under proper superior authority It was intended to deal with what all those responsible agreed was a real danger Whether as the result of the issue of the Army Council instruction of Sept 7th or not wholesale rejections especially in certain parts of the country were taking place of men who were useful for Army service though admittedly not up to the standard required in combatant units It was therefore necessary to point out to the officials responsible for such rejections that Army service comprises a great variety of occupations answering roughly to those found in civil life, and that men capable of performing such service in the Army must not be rejected This was regarded as a perfectly legitimate corrective to administer to those by whom the mistake was being made and it was quite properly addressed to them direct by their immediate official superior The recipients of the letter already had the Council instruction and obviously the two were to be read together The letter was marked 'confidential" and not "secret" and if anyone takes the trouble to read the rules in paragraphs 1857-1864 of the King's Regulations dealing with the military distinction between these terms he will realise that no official would have marked as confidential a letter intended by him to secure what I gather my honourable friend alleges to be the sinister purpose of securing by a subterfuge a modification of the declared policy of superior authority

TUESDAY, AUGUST 14TH

Army Medical Service

On report of the note of £'000 for Army Medical Service,

Mr PETO raised the question of "manipulative surgery" He asked that there should be no further delay in giving injured soldiers the benefit of the treatment offered by Mr Barker and others who had proved that they could treat injuries to the joints successfully He alluded to the opposition of medical men to "manipulative surgery" and to the refusal of Sir Rickman Godlee and Sir F Taylor to give evidence to an informal committee which was investigating the subject It was because of the opposition of the medical profession that the War Office would not give an opportunity to manipulative surgery"

Sir JOHN SIMON said that he was one of the informal committee, which looked into the question from a legal point of view and not from that of medicine or surgery If the Army Council saw fit in any given case to authorise the soldier to consult one of these unqualified medical advisers—it might or might not be wise from a medical standpoint—it was a perfectly legal thing to do

Sir W WATSON CHEYNE in a maiden speech, said that he felt he could speak freely on this subject because he had made up his mind that from the time he took his seat in the House he should give up private practice but he had asked that he should be allowed to continue his work in a naval hospital If they made an exception in regard to this individual gentleman honourable Members had to remember that there were a great many bonesetters in London, and he did not think that they could be kept out. However excellent Mr Barker might be, the granting of facilities to these others would have the result of flooding the Army Medical Service with a set of irregular practitioners who were absolutely incompetent Where were they to stop? Let him say a few words about bonesetters generally The average bonesetter did not know even the names of the bones He had only one diagnosis and one method of treatment, and that was to wrench and twist the limb The human frame was a very delicate organism It should not be meddled with by people who did not know it as thoroughly as they ought to know it. There was no doubt that in many cases bonesetters had given relief and for some time it was puzzling to know how this was brought about The honourable gentleman proceeded to deal with surgical questions involved in the treatment of injuries to the joints A good surgeon would treat these much more safely than a bonesetter could do He had known a case where a bonesetter had broken a malignant tumour with a tragic sequel for the patient He was afraid that he was giving a surgical lecture Matters like this deserved very careful consideration, and the House must not be led by the success of one man in a small department of surgery to upset a whole organisation

Sir GARROD THOMAS in a maiden speech, called attention to medical arrangements generally in connexion with the Army He agreed with what had been done in regard to the supply of doctors in Mesopotamia, Egypt and Salonika In France, however which was near at hand, it was a great waste to keep medical men there who were employed only two or three hours a day or who were employed on work which others than medical men could do He cited several cases of this wastage of valuable material in France There was also shocking waste in employing specialists in surgery in some other department or even in sanitary work There was enough material to go round both for the Army and the civil population if it was properly used But as things were, owing to bad Government organisation he knew of a case where only one doctor was left to look after a population of 11 000 He suggested that the Government should institute an inquiry to determine the relative needs of the Army and the civil population for doctors

After further discussion Mr MACPHERSON (Under Secretary for War) said that his department had done everything possible to meet the civilian need for doctors There was a Central Medical War Committee composed of representatives of the Local Government Board, the National Insurance Department and the War Office, which considered the claims of the military and civil populations That Committee had done its work very well But the War Office must have first consideration for the treatment of the soldiers at the front It was a regrettable fact that there were cases where there was difficulty in getting doctors to meet the civilian needs but many regrettable facts had to be admitted Even assuming however, that there had been a waste of medical men at the front, the Secretary for War had stated that he would send a committee of distinguished men to France to inquire into the matter He hoped to be able to announce the names of the committee in a few days It must be remembered however that even if doctors were partially idle at the front it was most necessary to provide all medical men necessary for times when there was a large number of casualties In regard to the charge that the Army Council refused to utilise the services of a distinguished man because he was not a qualified practitioner he said that the inefficient treatment of the soldier was a thing which would make the Government quake There were two bodies to be considered The first was the Army Council They must consider whether it would be right or wrong to ask any soldier to undergo treatment except by a man who had passed the statutory test Then as to the other responsibility, he understood that there was no objection to a soldier on his own responsibility going, if he chose, to have treatment from an unqualified man He did not think he could be asked in the public interest to make any concession

STUDENTS' NUMBER OF THE LANCET

INFORMATION intended for the Students' Number of THE LANCET must be sent WITHOUT DELAY, addressed to the Sub-Editor, and marked on the envelope "Students' Number Only"

"THE CAUSATION OF SEX"

To the Editor of THE LANCET

SIR,—In the book by Mr E R Dawson, reviewed in your columns on July 7th, there is no mention of the interesting work of R Robinson,[1] who found that adrenalised guinea-pigs gave birth to a preponderance of males, and cholinised animals to a preponderance of females He concluded that the sex of mammals is determined by the degree of activity of the mother s adrenals, hypoadrenalism giving female births, and hyperadrenalism male births He found that by a study of the reaction of Fränkel Allers (acid iodate of potassium) one can detect the presence of minimal quantities of adrenalin in the urine or blood of guinea pigs By this test, applied to the urine of four pregnant women he was able to forecast correctly the sex of their coming offspring If the woman's urine gives the reaction of adrenalin she will have a son, if not, a daughter In 1914 Bram took up the subject in 30 of his patients who wished to have a son[2] The treatment which he adopted successfully was ' the outcome of a combination and modification of the following two most plausible theories" of sex-determination —(1) that of Weill,[3] that sex depends on a contest between spermatozoon and ovum if the former be predominantly active the outcome is a male, and *vice versa* and (2) Robinson's theory Bram began treatment directly the period was missed kept it up till the fourth or fifth month, and then stopped it. If a boy was wanted, the patient was put on cereals fruits, potatoes, milk, butter milk, and butter, and plenty of water to drink She was forbidden eggs meat, fish, cheese After each meal a capsule was given containing 2 grs of adrenal extract and 4 grs. of lecithin, Bram believes that lecithin stimulates insufficient adrenals, and possibly also normal ones

Although there is room for much exact experimental study of this subject, yet there is something to say for Robinson's theory for any satisfactory theory of sex-determination must apply even far down in invertebrata We know by the work of Dr J F Gaskell[4] that the chromaffin system of the leech has a very marked action on its contractile vascular system But at the same time it seems unlikely that sex depends solely on the state of the mother's adrenals during pregnancy And we are still in the dark whether sex is determined soon after spermatozoon and ovum come to grips, or at a later period.

I am, Sir, yours faithfully,

London, N W., August 4th, 1917 LEONARD J KIDD

PLAGUE IN EGYPT DURING 1916

THE Department of Public Health of the Ministry of the Interior Egypt, has issued through the Government Press Cairo, a statistical summary of the cases of plague occurring in Egypt during the year 1916 and a comparison with the two previous years In 1914 181 cases were admitted to hospital, in 1915 188 cases and in 1916 1361 cases. The increased incidence began in December, 1915 and was at its maximum in April 1916, while by August the normal morbidity was reached again The percentage of deaths in hospital to admissions was 35 8 in 1916, against 38 8 in 1915 and 40·3 in 1914

HELPS TO FOOD ECONOMY

THE National Food Economy League, 3 Woodstock street Oxford street, London W, which is conducting an educational campaign throughout the country for the prevention of waste of the national food resources, has issued at the price of 6d a useful little pamphlet giving war time receipts for households where servants are employed Over 100 examples are given many of them being what may be called type receipts"—that is those which are applicable at discretion to other materials than those mentioned. As the book is intended for those who are able to afford the more expensive kinds of foods receipts are included which are economical in the sense that they save food rather than money For while the strictest economy of consumption should be exercised in all cases, everybody who can afford it should eat the more expensive kinds of food so as to leave the cheaper kinds for the poor Bread can be saved not only by using a smaller quantity but also by using substitutes This is a valuable cookery book in miniature, dealing with soups, stocks, fish, meat savouries, vegetables, sweets, sauces, and salads, with hints on breads and cakes which are of practical use at a time when there is urgent need of conserving our wheat supply.

HONEY

A LITTLE pamphlet on bees and honey by Mrs Grieve, of Chalfont St Peter, Bucks, gives the views of an expert, which will prove of interest not only to bee-keepers but to all gardeners and allotment-holders Notes on the natural history of bees are given, together with information as to the quality and quantity of honey that may be expected from bees feeding on particular flowers Honey as a food is discussed, with recipes for cake, bread, and sweets made from it

THE EMPLOYMENT OF WOMEN IN WAR TIME

THERE is no lack of employment for capable women at the present time Those who possess a training in one of many directions or are willing to undergo training can find immediate occupation if they know where to turn and to provide them with such information a useful book has been published entitled "Women's Work in War Time,"[1] enumerating the various posts open to women along with the qualifications required, the hours of work remuneration offered, and so on Among the occupations appealing to women of education are those of doctors, factory inspectors, health visitors infant protection visitors under the London County Council inspectors under the Local Government Board, creche matrons, dental mechanics, masseuses midwives, nurses organisers of care committees pharmacists sanitary inspectors, welfare superintendents, clerks, and secretaries A supplement contains a series of chapters from different pens describing in more detail the vocations enumerated in the first part

THE LANCET.

LONDON SATURDAY AUGUST 25, 1917

Students' Guide Session 1917–1918

THE ranks of the medical students are still sorely depleted, although, fortunately, not in the same measure as was the case a twelvemonth ago Many of the men who, in the ordinary course, would be entering upon a medical career are gaining in the bitter school of war an experience which cannot fail to stand them in good stead when they commence their studies, for there is no profession that requires more than medicine the qualities of self reliance and independent judgment But the same foresight which brought back the fourth and fifth year student from the trenches to complete his studies now ensures that those in earlier years shall remain at their work unless of first-class physique The increase of women students which was the novel feature of medical education in the last two years has now become an accepted commonplace when the proportion of women to men entering on medical studies is about as one to two The promise that a useful responsible, and successful career was offered to women in medicine has been perfectly clear for some time, and in the great organised movement to combat infantile mortality which is opening before us they will find more than sufficient scope for their special gifts But large as the number of women students actually is, there are doubtless many others who have been restrained from entering on their medical studies by the reluctance to give up the immediate patriotic work upon which they are engaged It is therefore to a public larger than last year, but still small, that the Students Number of THE LANCET is directed this year, and those who are pursuing their medical studies need no admonition to diligent and concentrated effort

In previous issues of this Guide we have been in the habit of giving a full account of the regulations for candidates desiring commissions in the Naval, Military, and Indian Medical Services with notes on rank pay, promotion, retirement allowances, and pensions All such information would now, however, be of passing interest The sections on Special *Training in Public Health* and in Tropical Medicine appear as usual Though the public health work of the country has been necessarily modified, the way in which our domestic and school hygiene has been guarded during the war remains most satisfactory An account is included of the Colonial Medical Service, whose activities have not been curtailed Dental education is dealt with as usual, although here, too, both students and facilities have suffered temporary curtailment

The General Council of Medical Education and Registration, conveniently known as the General Medical Council, is the controlling authority, under the Privy Council, of the medical education of the land Under the provisions of the Medical Acts various universities and corporations are recognised as being examining bodies whose degrees or diplomas entitle to medical registration and it is among the duties of the General Medical Council to keep the official register and to ensure by periodical visitations that the tests of the various examining bodies are maintained at a due standard During the past year the Council has reviewed the changes required to fit the course of medical studies to the exceptional times in which we live, and amongst other lesser changes has finally banished Latin from the list of compulsory subjects in the medical entrance examination We begin in the Students' Guide, which follows, by describing the powers of the General Medical Council, and go on to give in detail the regulations of the examining bodies

The systems under which the medical student obtains instruction do not conform to one pattern The curriculum falls into two parts, the preliminary subjects and the professional subjects, and the two cannot be sharply divided especially now when medicine is more than ever dependent on its handmaids of chemistry and physics The important preliminary subjects are chemistry pharmacology, physics, biology, anatomy, and physiology, and they are taught in the school proper, the professional subjects, medicine, surgery, and obstetric medicine —under which headings all forms of specialism are included—must be learned in the wards of a hospital All schemes of medical education require a school and a hospital, and end in the award to the student of a degree or diploma, but with this their uniformity ends

Information concerning the facilities for medical study, and the regulations for examinations at the various teaching centres, together with the names of the staffs[1] of the hospitals are so given that a student desiring to obtain a medical degree at any university will in general find under the same heading an account of the medical faculty of that university, and of the hospitals which form its field for clinical instruction. It is impossible to adhere rigidly to this plan without some cross reference, for, as is well known, the medical schools of some universities are served chiefly by hospitals in other centres Thus the majority of the medical students of Oxford and Cambridge pursue their clinical studies in London, and take the diplomas of the English Colleges, whilst any student who has gone through all his statutory training in a provincial centre may sit for a medical degree at the University of London The corporations which grant diplomas qualifying for the practice of medicine usually have no schools attached to them, but are content with examining students who have gone through the curriculum at any recognised metropolitan or provincial school

The Guide is divided into the three headings of England and Wales, Scotland, and Ireland, and the medical education in each country is dealt with as a separate entity The medical faculties of the universities in each country are first described, and then follows an account of the medical corporations having powers to grant diplomas by examination Under the heading of each university we give a general description of its arrangements for conferring medical degrees, of its facilities for preparing its students for those degrees, and particulars of those hospitals affording clinical instruction which are situated in the neighbourhood of the university buildings

---

[1] A large majority of the staffs of the general hospitals serving with the Army as [illegible] officers or as consultants have military titles, but in a compendium of medical education we have considered it simpler to omit them

GENERAL COUNCIL OF MEDICAL EDUCATION AND REGISTRATION OF THE UNITED KINGDOM

POWERS, DUTIES, AND CONSTITUTION OF THE GENERAL MEDICAL COUNCIL

THE powers and duties of the General Medical Council or "General Council of Medical Education and Registration of the United Kingdom" to give the Council its full title, have been set out in detail in many previous Students' Numbers of THE LANCET It is first a registering body no person, even though his qualifications have been *obtained*, *is a* legally qualified medical practitioner unless his name appears on the Medical Register Secondly, it is a standardising body, ensuring that the education of medical men is kept up to an efficient standard by scientific examination Thirdly, it is a penal and disciplinary body, having power to remove from the Register any practitioner adjudged guilty of conduct "infamous in a professional respect" Fourthly *to the* Council is committed the codification of pharmaceutical remedies

The duties of the Council are thus primarily of a public nature, and its construction shows its fitness for its fourfold responsibilities

The Council at present consists of 38 members, of whom, as will be seen by the annexed list, all but 11 are official representatives of some corporate body Five members *are chosen by the Crown on the advice of the Privy* Council, and six others are elected by the members of the medical profession as Direct Representatives

President of the General Council Sir Donald MacAlister, Members of the General Council Dr Norman Moore, chosen by the Royal College of Physicians of London, Mr Holburt Jacob Waring, Royal College of Surgeons of *England*, *Dr George Wilks, Apothecaries'* Society of London, Dr Arthur Thomson, University of Oxford, Sir T Clifford Allbutt, University of Cambridge, *Sir George Hare* Philipson University of Durham, Sir Frederick Taylor, University of London, Dr Grafton Elliot Smith, Victoria University of Manchester, Mr Harry Gilbert Barling University of Birmingham, Dr Richard Caton, *University of Liverpool*, Dr Alfred George Barrs, University of Leeds, Mr Rutherfoord John Pye Smith, University of Sheffield, Sir Isambard Owen, University of *Bristol, and Dr David Hepburn*, University of Wales Dr William Russell, chosen by the Royal College of Physicians of Edinburgh, Mr James William Beeman *Hodsdon Royal College of Surgeons of* Edinburgh, Dr David Neilson Knox, Royal Faculty of Physicians and Surgeons of Glasgow, Dr H Harvey Littlejohn University of Edinburgh, Sir Donald MacAlister, University of Glasgow, Dr John Theodore *Cash, University of* Aberdeen, and Dr John Yule Mackay, University of St Andrews Sir John William Moore, chosen by the Royal College *of Physicians* of Ireland, Sir Arthur Gerald Chance, Royal College of Surgeons in Ireland, Dr Edward Magennis Apothecaries' *Hall of* Ireland, Dr Arthur Francis Dixon, University of Dublin, Sir Bertram Coghill Alan Windle, National University of Ireland, and Dr Johnson Symington, Queen's University of Belfast Nominated by His Majesty, with the advice of his Privy Council Mr Charles Sissmore Tomes, Sir Arthur Newsholme, Sir Francis Henry Champneys Dr John Christie McVail, and Dr Edward Coey *Bigger* Elected as Direct Representatives Dr Langley Browne, Dr H A. Latimer, Dr J A MacDonald, *Mr Thomas* Jenner Verrall, Dr *Norman* Walker and Dr Leonard Kidd. Treasurers of the General Council Mr Charles Sissmore *Tomes* and Sir Frederick Taylor

THE EDUCATIONAL CURRICULUM[1]

Professional Education —The course of professional study after registration occupies at least five years The Final Examination in Medicine, Surgery, and *Midwifery* must not be passed before the close of the fifth academic year of medical study

Registration and Preliminary Examination of Medical Students —The following are the General Medical Council's Regulations in reference to the registration of students in medicine —

Every medical student should be registered in the manner prescribed by the General Medical Council The registration of medical *students* is placed under the charge of the Branch Registrars Every person desirous of being registered as a medical student should apply to the Branch Registrar of the division of the United Kingdom in which he is residing, and should produce or *forward to the Branch* Registrar a certificate of his having passed a preliminary examination as required *by the General Medical* Council, and evidence that he has attained the age of 16 years, and has commenced medical study at an institution approved by the Council. The Branch Registrar shall enter the applicant's name and other particulars in the Students Register and shall give him a certificate of such registration Each of the Branch Registrars shall supply to the several licensing bodies, medical *schools, and hospitals, in that part of the* United Kingdom of which he is registrar, a sufficient number of blank forms of application for the registration of medical students The commencement of the course of professional study recognised by any of the qualifying bodies should not be reckoned as dating earlier than 15 days before the date of registration In addition to the universities and schools of medicine there are many institutions where medical study may be commenced Applications for *special exceptions* are dealt with by the Students Registration Committee, which reports all such cases to the Council

Regulations for the Maintenance of the Register of Medical Students

The following examinations have been approved by the Council —(*a*) The final examinations for the degrees in Arts and Science of any University of the United Kingdom or of the British Dominions (*b*) All examinations which are accepted for Matriculation in the Faculties of Arts and Science in any University of *Great* Britain, provided the pass certificate includes English, Mathematics, and at least two *other subjects* named in the following list —Latin Greek Arabic, Persian, French, German, Spanish, Italian, Russian, or any approved modern language, History, Geography Natural Philosophy or Physics, Chemistry Biology, Physical Geography and Geology (*c*) All examinations not included under the foregoing section (*b*), which are accepted for Matriculation in the Faculty of Medicine in any University of the United Kingdom of Great Britain and Ireland provided the examination is completed at not more than two *periods* of examination, *and that the* pass-certificate includes English with Geography and History, Mathematics Latin, and at least one other subject named *in the* following list —Greek Arabic Persian, French, German Spanish, Italian Russian (*d*) The Council may grant special recognition to the following examinations not included under the foregoing sections (*a*) (*b*), and (*c*) —(1) The final examina*tions for the degrees in Arts* and Science of any specially recognised Foreign University (2) Examinations conducted by approved Examining *Bodies* within the United Kingdom under the provisions set forth in the foregoing section (*c*). (3) Examinations conducted by approved Examining Bodies out of the United Kingdom under the provisions set forth in the foregoing section (*c*), and under such other conditions as the Council may impose in each case

List of Bodies whose Examinations are accepted under the Foregoing Regulations

I *Examinations in Great Britain*

(1) The Matriculation Examinations in the Faculties of Arts of Science of and all examinations accepted in lieu thereof by, the following Universities Oxford (including Responsions and Moderations) Cambridge (including the Previous Examination and the General Examination), Durham, London, Manchester Birmingham *Liverpool* Leeds, Sheffield, Bristol Wales, Edinburgh, Glasgow Aberdeen, St Andrews These examinations are *accepted subject to the conditions* set forth under *Section* 2 (*b*) above (2) The Preliminary Examinations in the Faculty of Medicine of and *all examinations* accepted in lieu thereof by the Universities of Durham, Edinburgh Glasgow Aberdeen St Andrews *These* examinations are accepted subject to the conditions of Section 2 (*c*) above (3) Specially recognised Examinations conducted by approved *bodies*

The examinations named below conducted by approved bodies in so far as they are not included in any of *the foregoing* sections, are specially recognised by the Council under Section 2 (*d*) (2) —University *of* Oxford Senior *Local* Examinations ; Higher Local Examinations. University of Cambridge : Senior Local *Examinations* ; *Higher Local* Examinations Oxford and Cambridge Schools Examination Board

---

[1] A special leaflet showing the Council s requirements will be sent on application

Higher Certificate Examination[2] the School (or Leaving) Certificate Examination University of London: Senior School Examination Universities of Manchester Liverpool Leeds Birmingham and Sheffield Senior School Certificate (to include (*a*) English Language and Literature (*b*) Latin (c) Mathematics (*d*) Greek or a Modern Language and (*e*) and (*f*) any two other subjects as set out in the Regulations of the Board) School Certificate Higher Certificate University of Bristol: School Senior General Examination University of St. Andrews Final Examination for Diploma of L.L.A. Scotch Education Department Leaving Certificate Examinations passes in Lower Grade Leaving Certificate Examinations Intermediate Certificate Central Welsh Board: Senior Certificate Examinations College of Preceptors Examinations for the Senior Certificate Preliminary Examination for Medical Students Educational Institute of Scotland; Preliminary Medical Examination The examinations included in this list which do not fall within the groups accepted by the Universities in lieu of their Matriculation Examination in Arts or Science are recognised by the Council subject to the conditions set forth in Section 2 (*c*) above

II *Irish Examinations*

University of Dublin: Matriculation Examination: (*a*) Junior Freshman Term Examination (exclusive of Trigonometry) (*b*) Special Preliminary Examination to be held in March the standard and subjects of which shall be those of a Junior Freshman Examination (exclusive of Trigonometry) (c) Junior Exhibition Examination on obtaining marks of sufficient merit in the subjects of (*a*) or (*b*) (*d*) Examinations for the First, Second Third or Fourth Year in Arts (Certificate to be signed in the approved form by the Medical Registrar of the University) Queen s University of Belfast: Matriculation Examination National University of Ireland: *Matriculation Examination* Intermediate Education Board of Ireland Middle Grade Examination with Honours in three subjects Senior Grade Examination Royal Colleges of Physicians and Surgeons in Ireland: Preliminary Examination These Examinations are accepted subject to the conditions set forth in Section 2 (c) above

Further particulars are given in the Students' Regulations, which can be obtained at the offices of the Council, price 6*d*

The remainder of the curriculum, though all under the supervision of the Council, is in detail in the hands of the various degree and diploma granting bodies whose representatives are members of the General Medical Council In the next pages we give the regulations of the various examining bodies, but it must always be remembered that the examinations are under the supervision of the General Medical Council, who visit the various centres in turn and closely inspect the *procedure*

These examinations are accepted subject to the conditions set forth in Section 2 (*c*) above

Indian, Colonial, and Foreign Universities and Colleges

Every Certificate from Indian, Colonial, and Foreign Universities and Colleges must contain evidence that the Examination has been conducted by or under the authority of the Body granting it, must include all the subjects required by the General Medical Council, and must state that all the subjects of Examination have been passed in at not more than two examinations, copies of the form of the required Certificate are supplied by the Registrar of the Council for the purpose In the case of Natives of India or other Oriental countries whose vernacular is other than English an Examination in a Classical Oriental Language (e g, Sanskrit Arabic, Chinese) may be accepted instead of an Examination in Latin The German Abiturienten Examen of the Gymnasia and Real Schulen and the examinations entitling to the French diplomas of Bachelier ès Lettres and Bachelier ès Sciences and other corresponding Entrance Examinations to the Universities in Europe are recognised by the General Medical Council

The Officers of the Council

Norman C King Registrar of the General Council and of the Branch Council for England, 44, Hallam street, Portland place W —James Robertson, Registrar of the Branch Council for Scotland, 54, George square Edinburgh —Richard J E Roe Registrar of the Branch Council for Ireland 35 Dawson street, Dublin All communications should be addressed to 'The Registrar" and not by name

POSTPONEMENT OF THE ELECTION OF DIRECT REPRESENTATIVES

By an Order in Council dated August 10th the provisions of the Parliament and Local Elections Act, 1917 have been extended to the election of members of this Council by registered practitioners resident in the United Kingdom, the effect of which is to extend the term of office of the existing Direct Representatives until Dec. 31st 1918 Accordingly no election of Direct Representatives will fall to be held in the present year

---

For particulars see Regulations issued by the Board.

THE
MEDICAL EXAMINING BODIES
AND
SCHOOLS OF THE UNITED KINGDOM

A GUIDE TO THE FACILITIES FOR OBTAINING THE VARIOUS MEDICAL DEGREES AND OTHER QUALIFICATIONS FOR THE BRITISH MEDICAL REGISTER

I —ENGLAND AND WALES
THE UNIVERSITIES

UNIVERSITY OF OXFORD

THERE are two degrees in Medicine, *B M and D M*, two degrees in Surgery, *B Ch and M Ch*, and two diplomas, *Public Health* and *Ophthalmology*

Graduates in Arts (B A. or M A) are alone eligible for the degrees The most convenient course for the B A degree for intending graduates in Medicine is to take Responsions, the Preliminary Science Examinations mentioned below, and the Final Honour School of Physiology In order to obtain the degrees of B M and B Ch the following examinations must be passed —1 Preliminary subjects Mechanics and Physics, Chemistry, Animal Morphology, and Botany 2 Professional (*a*) First Examination Subjects—Organic Chemistry, unless the candidate has obtained a first or second class in Chemistry in the Natural Science School, Human Physiology, unless he has obtained a first or second class in Animal Physiology in the Natural Science School, Human Anatomy (*b*) Second Examination Subjects—Medicine, Surgery, Midwifery, Pathology, Forensic Medicine with Hygiene, Materia Medica and Pharmacology The approximate dates of the examinations are as follows —Preliminaries—Mechanics, Physics, and Chemistry, December and June, Animal Morphology, December and March, Botany, March and June, Professional (First and Second B M), June and December

The First Examination for the degrees of B M and B Ch may be passed as soon as the Preliminary Scientific Examinations have been completed Anatomy and Physiology are to be passed together, and Organic Chemistry may be taken before or after these have been passed

The Second Examination may be passed after the completion of the first, but Pathology, Hygiene, and Materia Medica and Pharmacology may be taken before or with the remaining subjects Before admission to the Second Examination candidates must present certificates of attendance on a course of laboratory instruction in Practical Pathology and Bacteriology and of having acted as post-mortem clerk for three months, surgical dresser for six months, and clinical clerk for six months Also they must produce certificates of instruction in Infectious and Mental Diseases, and of attendance on Labours, of proficiency in the practice of Vaccination and Anæsthetics and of having attended a course of Practical Pharmacology Also in respect of the First Examination candidates must present certificates showing that they have dissected the whole body once and have attended courses of laboratory instruction in Practical Histology and Practical Physiology

The degree of D M is granted to Bachelors of Medicine of the University provided they have entered their thirty ninth term and have composed on some *medical* subject a dissertation which is approved by the professors in the Faculty of Medicine and examiners for the degree of B M whose subject is dealt with A book published within two years of the candidate s application for the degree may be substituted for a dissertation The Regius Professor may direct the dissertation to be read in public The degree of M Ch. is granted to Bachelors of Surgery of the University who have entered their twenty seventh term, who are members of the surgical staff of a recognised hospital, or have acted as Dresser or House Surgeon in such a hospital for six months, and who have passed the M Ch examination in Surgery, Surgical Anatomy, and Surgical Operations This examination is held annually, in June at the end of the Second B M Examination

Diploma in Ophthalmology —There is an examination once in each year in the Theory and Practice of Ophthalmology for the purpose of granting certificates of proficiency therein styled Diplomas in Ophthalmology The examination is under the supervision of the Board of the Faculty of Medicine, which has power to make regulations as to the subjects of the examination, the time at which the examination is held, and the conditions of admission No candidate is admitted to the examination for the diploma who has not pursued at Oxford a course of study in Ophthalmology approved by the Board of the Faculty of Medicine, and extending over a period of at least three months The fee for admission to the examination is £15, unless the candidate is a graduate of the University, in which case it is £10 only

Travelling Fellowship, Scholarships and Prizes — A Radcliffe Travelling Fellowship is awarded annually after an examination held in February It is tenable for three years and is of the annual value of £200 The examination is in Physiology, Pathology, and Hygiene, and is partly "practical" Candidates must be graduates in Medicine of the University The holder must travel abroad for the purpose of medical study Application should be made to the Radcliffe Examiners, Radcliffe Library, University Museum A Rolleston Memorial Prize is awarded once in two years to members of the Universities of Oxford and Cambridge of not more than ten years' standing for an original research in some Biological subject, including Physiology or Pathology The Radcliffe Prize, founded by University College (1907), is of the value of £50 and is awarded biennially for research in some branch of medical science The Theodore Williams Scholarships of the value of £50 each are awarded annually in the subjects of Anatomy, Physiology, and Pathology A King's College Hospital Burney Yeo Scholarship of £80 is awarded each year The Scholarships in Science which are offered by several Colleges are open to those who intend to pursue Medicine The value of these scholarships is usually £80 a year for four years

More detailed information may be obtained from the University Calendar, from the Examination Statutes, 1915, from the *Student's Handbook to the University* (all of which are published by the Clarendon Press), from the Regius Professor of Medicine, and from the Professors in the several departments of medical science Certain special conditions as regards students who have served for two years with the British Expeditionary Force may be obtained on application to the Registrar of the University, Clarendon Building

Professors — Botany (Sherard) S H Vines, M A. Chemistry (Waynflete) W H Perkin, D Sc Comparative Anatomy (Linacre) G C Bourne, D Sc Human Anatomy A. Thomson, M A Lecturer in Applied Anatomy A P Dodds Parker, B M Medicine (Regius) Sir W Osler, Bart, D M Litchfield Lecturer W Tyrrell Brooks, M B Surgery, Litchfield Lecturer E O Bevers, B M Natural Philosophy (Sedleian) A E H Love, D Sc Physics (Wykeham) J S E Townsend, M A Physiology (Waynflete) C S Sherrington, M D Zoology E B Poulton, D Sc Pathology G Dreyer M D Lecturer E W A Walker, D M Morbid Anatomy A G Gibson, D M Pharmacology (Reader) James Gunn, M D

In addition to the University lectures and classes the several *Colleges provide their undergraduates* with tuition for all *examinations* up to the B A. degree

In the Radcliffe Infirmary and County Hospital clinical instruction is given by the Regius Professor of Medicine, the Litchfield Lecturers in Medicine and Surgery, *and the other* physicians and surgeons Instruction is also given in post-mortem work and Clinical Pathology in connexion with the courses in Pathology

UNIVERSITY OF OXFORD RADCLIFFE INFIRMARY AND COUNTY HOSPITAL —Courses of instruction are given in connexion with the Oxford University Medical School These include (1) a course in Practical Medicine by the Regius Professor of Medicine, (2) Clinical lectures by the *Litchfield* Lecturers in Medicine and Surgery, and (3) tutorial instruction and *demonstrations in special* Regional Anatomy (medical and surgical), methods of Medical and Surgical Diagnosis, and Surgical Manipulation (4) Pathological demonstrations and instruction in post mortem work are given by the Assistant Pathologist Practical Pharmacy is taught in the Radcliffe Dispensary Opportunities are offered to students who wish to act as surgical dressers and clerks The Hospital contains 170 beds Honorary Surgeon Mr H P Symonds *Active Consulting* Physician Professor Sir William Osler, Bart Active Staff —*Honorary* Physicians Dr W Tyrrell Brooks, Dr W Collier, and Dr F Mallam Honorary Assistant Physician and Medical Registrar Dr A Waters Electro-Therapeutic Physician Dr W J Turrell *Honorary Surgeons* Mr R H A Whitelocke, Mr A P Dodds Parker, and Mr E O Bevers Honorary Assistant Surgeon and Surgical Registrar (Vacant) Consulting Ophthalmic Surgeon Mr P E H Adams Honorary Consulting Pathologist Professor Georges Dreyer Honorary Assistant Pathologist Dr A G Gibson Consulting Dental Surgeon Mr E A. Bevers Honorary Radiographer Mr R H Sankey House Physician *(Vacant) House Surgeon Mr W G Bendle Casualty* House Surgeon (Vacant)

UNIVERSITY OF CAMBRIDGE

The student must enter at one of the Colleges, or as a non collegiate student, and keep nine terms (three years) by residence in the University He must pass the *Previous Examination* in *Classics*, Mathematics &c., if possible, before he comes into residence in October, or he may obtain exemption through the Oxford and Cambridge Schools Examination Board, the Oxford or Cambridge Senior Local Examinations, the London *Matriculation Examination*, the *Scotch Education* Department, Responsions at Oxford, and the Joint Matriculation Board of the Universities of Manchester, Liverpool, Leeds, and Sheffield, the Matriculation Examination of the University of Birmingham, or by being graduates of certain other Universities in the United Kingdom He may then devote himself to medical study in the University, dissecting, attending the hospital and the medical lectures, &c. Or he may, as nearly all students now do, proceed to take a degree in Arts by passing either (*a*) the General Examination and one Special Examination or (*b*) two Special Examinations for *the ordinary* B A *degree, or going out* in one of the Honour Triposes The Natural Sciences Tripos is taken most frequently, *as some of the subjects* are practically the same as those for the first and second M B

For the degree of *Bachelor of Medicine* (*M B*) five years of medical study are required either in Cambridge or at one of the recognised Schools of Medicine. The first *three or four years are usually spent* in Cambridge, the student remaining in the University till he has passed, say, the examination for Part I of the Natural Sciences Tripos and the first and second examinations for M B Hospital practice and many of the requisite lectures may be *attended in Cambridge, and a* certain number of students remain to attend lectures and hospital practice until they have passed the second part of the second examination for M B The laboratories for Botany, Chemistry Physics Biology, Zoology, Human Anatomy, Physiology Biochemistry, Pathology, Bacteriology, Pharmacology, Psychology, and Public Health are well equipped. *Addenbrooke's* Hospital, the Infectious Diseases Hospital the Cambridge Research Hospital, and the Field Laboratories are utilised for study and research

There are three examinations for M B The *first* includes (1) Chemistry and other branches of Physics, and (2) Elementary Biology These parts may be taken together or separately The *second* is divided into two parts—viz, (1) Human Anatomy and Physiology, and (2) Pharmacology and General Pathology The *third* is also divided into *two* parts (1) *Principles* and Practice of Surgery (including Special Pathology and Midwifery and Diseases Peculiar to Women), and (2) Principles and Practice of Physic (including Diseases of Children, Mental Diseases, Medical Jurisprudence) Pathology (including Hygiene and Preventive Medicine), and Pharmacology (including Therapeutics and Toxicology) The examinations are partly in writing, partly oral, and partly practical *in the hospital*, in the dissecting *room*, and in the laboratories An Act has then to be kept in the Public Schools, by the candidate reading an original dissertation composed by himself and being examined orally on *some* subject approved by the Regius Professor of Physic

Candidates who have passed both parts of the third M B examination are admitted to the registrable degree of *Bachelor of Surgery* (*B Ch*) without separate examination and without keeping an Act

The degree of *Doctor of Medicine* (*M D*) may be taken three years after that of M B or four years after that of

M A. The candidate is required to produce certificates of having been engaged in Medical Study for five years, and if an M A. some certificates of attendance on Lectures, and of attendance on Hospital Practice, and to pass the same examinations as are required for the degree of M B An Act has to be kept, consisting of an original Thesis sustained in the Public Schools with *viva voce* examination, and a short extempore essay has to be written on a topic taken from the general subject of his thesis, whether it be Physiology, Pathology, Pharmacology the *Practice* of Medicine, State Medicine, or the History of Medicine

For the degree of *Master of Surgery* (*M. Ch*) the candidate must have passed all the examinations for B C , or, if he is an M A., have obtained some other registrable qualification in surgery He is required either (1) to pass an examination in Principles and Practice of Surgery, Surgical Anatomy and Surgical Operations, and Pathology, and to write an extempore essay on a Surgical Subject, or (2) to submit to the Medical Board original contributions to the advancement of the Science or Art of Surgery Before he can be admitted to the examination two years at least must have elapsed from the time when he completed all required for the degree of B C Before submitting original contributions he must have been qualified at least three years

An abstract of the Regulations and Schedules of the range of the examinations in Chemistry, Physics Biology, Pharmacology, and General Pathology may be obtained upon sending a stamped directed envelope to the Registrary, the Registry, Cambridge

The Professors, Readers, and Lecturers in the various subjects are as follows Professors—Anatomy A. Macalister, M D Biology (Quick) G H F Nuttall, Sc.D Botany A C Seward M A Chemistry W J Pope, M A. Natural Philosophy (Jacksonian) Sir James Dewar, M.A. Pathology G Sims Woodhead, M A. Physic (Regius) Sir T Clifford Allbutt, M D Physiology J N Langley, Sc.D Surgery (Vacant) Therapeutics (Downing Professor of Medicine) J B Bradbury, M D Zoology, &c. J Stanley Gardiner, M A. Readers—Botany F F Blackman, M.A Chemical Physiology F G Hopkins, M A. Zoology A. E Shipley, Sc.D Lecturers—Bacteriology Louis Cobbett, M D Hygiene G S Graham Smith, M D Botany A. G Tansley, M.A., and R P Gregory, M A Chemistry H. J H Fenton, Sc D Organic Chemistry S Ruhemann, M.A. Chemistry and Physics as Applied to Hygiene J E Purvis, M A. Advanced Morphology of Vertebrates H Gadow, M A. Pathology (Huddersfield) T S P Strangeways M.A. Physics G F C Searle, Sc.D , and C T R Wilson, M A Pharmacology W E Dixon, M A Advanced Physiology L E Shore M D Physiology W B Hardy, M A. Neurology H K Anderson, M D Physiology of the Senses W H R. Rivers, M A. Experimental Psychology C S Myers, M D , Sc D Physical Anthropology W L H Duckworth M D , Sc.D

Women Students —Increased facilities have been offered to students of Girton and Newnham Colleges and they are admitted to the Final and Second M B Examinations under certain conditions

University Prize in Medicine —The one University Prize in Medicine the Raymond Horton Smith Prize (value £19) is awarded to that candidate for the degree of M D who presents the best thesis for the degree during the academical year, provided that he has taken honours in a tripos examination Medical Studies are endowed by the numerous Natural Science scholarships at the various colleges, information about which can be obtained from the respective Tutors

---

ADDENBROOKE S HOSPITAL —Clinical Lectures in Medicine and Surgery, in connexion with Cambridge University Medical School, are given at this hospital twice a week during the academical year, and practical instruction in Medicine and Surgery is given in the wards and out-patients rooms by the physicians and surgeons daily during the term time and vacations The fee for pupilship is 3 guineas a term Physicians Professor Sir Clifford Allbutt Professor Bradbury Dr L. Humphry Dr Lloyd Jones and Dr Aldren Wright Surgeons Mr G E Wherry, Mr F Deighton, Dr Griffiths and Mr Arthur Cooke All communications by students should be made to Dr Aldren Wright

UNIVERSITY OF LONDON

The University of London was established by Royal Charter in 1836 as an examining and degree conferring body with affiliated colleges but no direct teaching functions In 1900 it was reconstituted under the Act of Parliament 1898 and became a *teaching* as well as an examining body Many schools already existing became constituent colleges, including all the metropolitan medical schools Teachers were also appointed in special subjects to give lectures at the University

Teaching Staff —The teaching staff of the University is organised under two heads 1 Appointed teachers—i e , such as are appointed by, and are paid out of the funds of, the University 2 Recognised teachers—i.e , those who have been appointed and are paid by the several schools of the University and other institutions at which instruction is given under the auspices of the University, and who have been recognised by the Senate as conducting work of University standard Courses by non recognised teachers may also be approved in schools of the University The lecturers in the Medical Sciences and the professors in the Faculties of Medicine in University College, London, and King s College, London, will be found enumerated under their respective medical schools

Internal and External Students —All the examinations of this University are open to men and women alike Matriculated students of the University may be either internal or external Internal students of the University are students who have matriculated at the University and who are pursuing a course of study approved by the University, either (*a*) under the direct control of the University or a committee appointed thereby, or (*b*) under one or more of the appointed or recognised teachers of the University Centres for preliminary and intermediate medical studies have been established by the University at University and King s Colleges Internal students must pursue their studies at one of the above centres or at one of the medical schools connected with the University These are St Bartholomew's Hospital, Charing Cross Hospital St George's Hospital, Guy's Hospital, King s College Hospital, the London Hospital, St Mary's Hospital, the Middlesex Hospital, St Thomas's Hospital, University College Hospital, Westminster Hospital and the London (Royal Free Hospital) School of Medicine for Women The London School of Tropical Medicine and the Lister Institute of Preventive Medicine are also recognised as schools of the University in special departments External students are all other matriculated students, and may pursue their studies at other universities and medical schools presenting themselves for examination at the University of London

Faculty of Medicine —The Faculty of Medicine grants the joint degrees of M B , B S (*Bachelor of Medicine and Surgery*), and the higher separate degrees of M D (*Doctor of Medicine*) and M.S (*Master of Surgery*)

The curriculum for the medical degrees is now five and a half years from the time of matriculation, except in the case of students who have passed the Preliminary Scientific Examination or the First Examination for Medical Degrees before July, 1910 and the examinations formerly known as the Preliminary Scientific, the *Intermediate*, and the Final Examination in Medicine are now respectively entitled the First Second, and Third Examinations for Medical Degrees Part II. of the former Preliminary Scientific Examination has now been made Part I. of the Second Examination

A. *Internal Students* —In order to be admitted to the Bachelor s degrees a student must [illegible] after registration as an internal student, have [illegible] attended [illegible] prescribed courses of study for five and a [illegible] more schools of the University (2) [illegible] ing examinations, under the conditions [illegible] (*a*) The First Examination for Medical Degrees [illegible] Chemistry Physics and General Biology [illegible] mination for Medical Degrees Part I [illegible] Chemistry, Part II Anatomy, Physiology [illegible] cology, including Pharmacy and Materia Medica [illegible] Third Examination for Medical Degrees [illegible] Examination in Medicine including [illegible] Mental Diseases Surgery Midwifery [illegible] Women, Pathology Forensic Medicine and [illegible]

B *External Students* —To be admitted to [illegible] degrees an external student must (1) have [illegible] culation examination or have been exempted therefrom under Statute 116 not less than five and a half years previously, (2) have passed subsequent examinations similar to those required of an internal student, and (3) have been engaged in professional studies during the five and a half years subsequently to Matriculation and four and a half years subsequently to passing the First Examination for Professional Degrees at one or more of the medical institutions or schools recognised by this University for the purpose, one year at least of the four and a half years to have been spent in one or more of the recognised institutions or schools in the United Kingdom

The First Examination for Medical Degrees (*Inorganic Chemistry, Physics, and General Biology*) will take place twice in each year, commencing on the Monday following Dec 10th and on the second Monday in July It must as a rule be passed by internal students not less than one academic year after matriculation and by external students not less than nine months after matriculation

The Second Examination for Medical Degrees (Part I) Organic Chemistry —This examination will take place twice in each year, commencing on the Thursdays following the third Monday in March and the second Monday in July No candidate will be admitted to this examination within six months of having passed the First Examination [During the continuance of the war only this examination will be held in December as well as in March and July]

The Second Examination for Medical Degrees (*Part II*) takes place twice in every year, commencing on the third Monday in March and on the first Monday in July The subjects of the examination are Human Anatomy and Embryology, Physiology, and Pharmacology, including Pharmacy and Materia Medica No candidate shall be admitted to the examination unless he has passed the First Examination for Medical Degrees at least 18 months previously, and has passed Part I of the Second Examination for Medical Degrees

The Third or M B , B S Examination —The M B , B S examination takes place twice in each year, commencing on the fourth Monday in October and on the first Monday in May No candidate except those who pass the Preliminary Science or First Examination for Medical Degrees before July will be admitted to this examination within three academic years from the date of passing in Anatomy and Physiology at the Second Examination (Part II), nor unless he has completed that examination together with prescribed courses of study or practice summarised below (1) Principles and Practice of Medicine, (2) Clinical Methods and Physical Diagnosis, (3) Insanity (with clinical demonstrations at a recognised Asylum), (4) Therapeutics, (5) Vaccination, (6) Principles and Practice of Surgery, (7) Operative Surgery, Surgical Anatomy, Practical Surgery, and the Administration of Anæsthetics, (8) Diseases of the Eye Ear, and Throat, (9) Lectures and Demonstrations on Midwifery and Diseases of Women, (10) Practical Midwifery, the conduct of at least 20 Labours, and practice as a Clinical clerk in Gynæcological work, (11) Pathology and Bacteriology, (12) work of the Post-mortem room, (13) Forensic Medicine, and (14) Hygiene He must also have attended the Medical and Surgical practice of a recognised hospital for two years and a course of instruction at a recognised Fever Hospital for two months [1] He must have had clinical instruction and must have held the posts of medical clinical clerk and surgical dresser for periods of six months each Candidates will be examined in Medicine (including Therapeutics and Mental Diseases), Pathology, Forensic Medicine and Hygiene, Surgery, Midwifery, and Diseases of Women The subjects may be divided into two groups—namely (1) Medicine, Pathology, Forensic Medicine, and Hygiene, and (2) Surgery, Midwifery, and Diseases of Women These groups may be taken either separately or together The list of candidates who have passed will be published in two parts—namely, an Honours list and a Pass list. Bachelors of Medicine of this University who graduated in or before May, 1904, may obtain the B S degree by passing the Surgical part of the M B , B S examination.

Doctor of Medicine —The examination for this degree takes place twice in each year, commencing on the first Monday in December and on the first Monday in July Candidates may present themselves for examination in one of the following branches, namely (1) Medicine, (2) Pathology, (3) Mental Diseases, (4) Midwifery and Diseases of Women, (5) State Medicine, and (6) Tropical Medicine. Any candidate for the degree of M D may transmit to the Registrar a thesis or published work having definite relation to the branch of Medicine in which he is a candidate, and if the thesis be approved by the examiners the candidate may be exempted from the written examination in that subject

Master in Surgery —The examination for the degree of Master in Surgery takes place twice in each year and commences on the first Monday in December and on the first Monday in July

Fees —Matriculation £2, which will be returned if the candidate withdraws his name before the last day of entry Should he fail to present himself an additional £1 will be charged on subsequent presentation within eight months £2 will be charged on each subsequent entry At provincial examinations an additional fee of £1 to £3 is charged by the local authorities at the time of examination. First M B B S Examination £5 for each entry to the entire examination, or £2 each subject if the examination is taken in parts Second M B , B S Examination Part I £2, repeated on each subsequent entry, Part II £8 for the whole examination For re examination in one subject £4 Third (Final) M B , B S Examination £10 for each entry to the whole examination and £5 for examination or re-examination in each group M D Examination £20, for re examination £10 M S Examination As for M D

Full details of the prescribed curricula of study and the names of the recognised Internal and External Schools of the University, can be obtained free on application to the Academic Registrar, University of London, South Kensington S W

MEDICAL SCHOOLS OF THE UNIVERSITY OF LONDON [1]

ST BARTHOLOMEW S HOSPITAL AND COLLEGE.—The hospital contains 757 beds, of which 687 are for patients in the hospital at Smithfield and 70 for convalescent patients at Swanley It receives over 8000 in patients annually and its out-patients and casualties amount to more than 78,000 annually Special departments have been organised for Diseases of Women and Children, the Eye, Ear, Larynx, and Skin, as well as for Orthopædic and Dental Surgery, and for Electro therapeutics and X Ray work Surgical operations take place every day at 1 30 P M and Surgical Consultations are held on Thursdays at the same hour Medical Consultations are held on Thursdays at 3 15 P M The physicians and surgeons deliver clinical lectures weekly during both the winter and the summer sessions Clinical Lectures on all special subjects are also given The visits of the physicians and surgeons are made at 1 30

Ten house physicians and ten house surgeons are appointed annually and are provided with rooms by the hospital authorities and receive £80 a year as salary A resident midwifery assistant, an ophthalmic house surgeon, and a house surgeon for diseases of the throat, nose, and ear are appointed every six months, and are provided with rooms and receive a salary of £80 a year Three resident anæsthetists are appointed annually, and receive salaries of £120, £100, and £100 respectively, with rooms An extern midwifery assistant is appointed every three months and receives a salary of £80 a year The clinical clerks, the obstetric clerks, the clerks to the medical out-patients, the dressers to the surgical in patients and to the out-patients and the dressers in the special departments are chosen from the students A residential college is attached to the hospital

---

[1] During the continuance of the war students who have not passed the Second Examination for Medical Degrees in Anatomy and Physiology, but who have completed one year's study after passing the First Examination for Medical Degrees will be allowed to count not more than six months service as clinical clerk or not more than six months service as surgical dresser in a recognised hospital as if they had so passed the examination in question Clinical service during the continuance of the war for any period of not more than twelve months in a medical Unit of the Regular or Territorial Forces, or in a hospital or detachment of the Red Cross Society or in any hospital recognised by the military or naval authorities for war purposes, will be accepted by the University as equivalent to the medical and surgical practice in a recognised hospital for an equal period and further any portion or the whole of the time so spent will be accepted as equivalent to time spent either as a clinical-clerk or as a dresser at the choice of the candidate Clinical service during the continuance of the war as set forth above will be similarly accepted for a period not exceeding six months from students who have not passed the Second Examination for Medical Degrees in Anatomy and Physiology but who have completed one year of study after passing the First Examination for Medical Degrees as if they had so passed the examination in question

[1] For Ancillary Metropolitan Medical Schools see p 293

New Buildings —The new buildings comprise residential quarters for the resident staff, casualty, medical, surgical, and special out-patient departments, casualty wards, dispensary, and clinical lecture theatre A new chemical laboratory has been added to the Medical School and a laboratory devoted to instruction in Public Health A second new block is devoted to Pathology, and contains the post-mortem room as well as extensive laboratories for bacteriology clinical pathology pathological histology, and pathological chemistry *The Medical School Buildings* include three large lecture theatres a large dissecting room, a spacious library (containing 13,000 volumes), a well-appointed museum of anatomy, physiology, comparative anatomy materia medica, botany, and pathological anatomy The pathological museum is the most complete in the kingdom There are laboratories for chemistry, physiology, pharmacology, physics, public health, and biology, giving ample accommodation in every department.

Special Classes for the Primary and Final F R C S are held twice yearly *Instruction in Preliminary Science* is given to University of London students in chemistry, biology, and physics throughout the year *Laboratory Instruction for the D P H* is provided during the winter and summer sessions

The recreation ground of 10 acres is at, Winchmore Hill for the use of the members of the Students Union, which all students are expected to join The Students' Union contains a large reading and smoking room, a committee and writing room, luncheon and dining hall, and a miniature rifle range

Staff —Consulting Physicians Sir William Church, Dr Hensley, Sir Dyce Duckworth, Dr N Moore, Dr S West, and Dr Ormerod. Consulting Physician Accoucheur Sir Francis Champneys. Consulting Surgeon Mr H. Cripps Consulting Aural Surgeon Mr Cumberbatch Physicians Sir Wilmot Herringham, Dr Tooth, F.R.S Dr Garrod F R S, Dr Calvert and Dr H M Fletcher Surgeons Sir Anthony Bowlby Mr D Arcy Power Mr Waring Mr McA. Eccles, and Mr Bailey Physicians with charge of Out-patients Dr Drysdale and Dr Hartley Assistant Physicians Dr Horder, Dr Langdon Brown and Dr Thursfield Surgeons with charge of Out-patients Mr Rawling, Mr Gask, and Mr G Watson Assistant Surgeons Mr H. W Wilson and Mr W G Ball Physician Accoucheur Dr Griffith Physician Accoucheur with charge of Out-patients Dr Williamson Assistant Physician Accoucheur Dr Barris Ophthalmic Surgeon Mr Holmes Spicer Assistant Ophthalmic Surgeon Mr Foster Moore. Surgeon for Diseases of the Throat and Nose Mr Harmer Assistant Surgeon for Diseases of the Throat and Nose Mr Rose. Aural Surgeon Mr C E West Assistant Aural Surgeon Mr S R Scott Dental Surgeons Mr Ackland and Dr Austen. Assistant Dental Surgeons Mr F Coleman and Mr J G A. Fairbank. Orthopædic Surgeon Mr Elmslie Physicians for Diseases of Children Dr Fletcher and Dr Thursfield Physician for Diseases of the Skin Dr Adamson Medical Officer in charge of Electrical Department Dr Cumberbatch Medical Officer to the X Ray Department Dr Walsham Pathologist Dr F W Andrewes F R.S Assistant Pathologist Dr Gordon. Administrators of Anæsthetics Mr Cross Mr Boyle, and Mr Trewby Medical Registrars Dr C M H. Howell and Dr Gow Surgical Registrars Mr Blakeway and Mr Roberts Casualty Physicians Dr Feiling and Dr Trevan. The staff deliver the lectures and demonstrations in their subjects

Other lecturers and demonstrators are —Practical Midwifery Dr M Donaldson Chemical Pathology Mr Wallis Practical Pathology Dr Stansfeld Mr Vick, Dr Canti Mr Davis Dr T H G Shore, and Mr Just Mental Diseases Sir R Armstrong-Jones Forensic Medicine Dr R A. Lyster Anatomy Dr Macphail Practical Anatomy Mr Stanley and Mr Moreton General Anatomy and Physiology Dr F A Bainbridge Practical Physiology Dr Trevan. Materia Medica, Pharmacology, and Therapeutics Dr Hamill Biology Dr Shore and Dr Cunnington Chemistry Dr Hurtley Practical Chemistry Dr Hurtley and Mr Cahen Physics Mr Womack Practical Physics Mr Womack and Mr Hopwood Public Health Dr Lyster Museum Curator Dr Andrewes Junior Curator Mr Armstrong Dean of the Medical School Dr Shore. Warden of the College Mr W G Ball

Scholarships given in aid of Medical Study —At this school various Scholarships, prizes, &c, are given. For five of the Scholarships and the Exhibition—namely, (*a*), (*b*), (*c*), three Entrance Scholarships of the respective values of £75, £75 and £150, (*d*) Entrance Scholarship in Arts, £100, (*e*) Jeaffreson Exhibition £50, and (*f*) Shuter Scholarship, £50—a full or University course at St Bartholomew s Hospital is required The awards of (*a*), (*b*), and (*c*) are made after examination in selections from the subjects of Chemistry, Physics, Zoology, Botany, Physiology, and Anatomy, (*d*) and (*e*) are awarded after examination in Latin, Mathematics, and Greek or French or German, (*f*) is awarded after competitive examination among Cambridge Graduates in Anatomy and Physiology These remaining Scholarships and prizes are as follows —Four Junior Scholarships (*g*) No 1, £30, Anatomy and Physiology, (*h*) No 2, £20, Anatomy and Physiology, (*i*) No 3, £25, Chemistry, Physics and Biology, (*j*) No 4 £15, Chemistry, Physics, and Biology (*k*) Senior Scholarship £50, Anatomy, Physiology, and Chemistry, (*l*) Kirkes Scholarship, £30 and medal, Clinical Medicine, (*m*) and (*n*) two Brackenbury Scholarships, £39 each, one in Medicine and one in Surgery, (*o*) Sir G Burrows Prize, £10, Pathology, (*p*) Skynner Prize, 13 guineas, Regional and Morbid Anatomy, (*q*) Matthews Duncan Medal and Prize, £20, Midwifery and Gynæcology, (*r*) Luther Holden Research Scholarship in Surgery awarded by election, £105, and (*s*) Lawrence Research Scholarship and gold medal in Pathology, awarded by election, £115

CHARING CROSS HOSPITAL.—The Hospital, to which the School is attached, contains 300 beds Over 3000 cases pass through its wards each year, and some 24,000 out-patients and casualties are treated There are special departments for Mental Diseases, Midwifery, Diseases of Women, of Children, of the Skin, Eye, Ear, Throat, Nose, and Teeth for Orthopædic Cases X Ray work, and for Electrical Examination and Treatment

Appointments —In the Medical School Demonstratorships and Assistant Demonstratorships are open to students of the School. Medical, Surgical, and Obstetric Registrars to the Hospital are appointed annually Six House Physicians, six House Surgeons, and two Resident Obstetric Officers are appointed each year after competitive examination

Primary and Intermediate Studies —By an agreement with the University of London the School sends its Primary and Intermediate Students to receive their lectures and practical work at King s College which is situated within four minutes walk. This arrangement has proved most successful

Final Studies —These are taken in the school and hospital where systematic lectures, demonstrations, and tutorial classes are arranged to cover all the subjects necessary for qualifying examinations Departments are also available for other final subjects of Bacteriology, Clinical Pathology, Materia Medica, Toxicology Public Health, and Operative Surgery and also for Research Work and Post-graduate Work

The *Museum* contains over 4000 specimens including a notable collection of over 800 gynæcological specimens, The Cuthbert Lockyer Collection."

Students Club —The social comfort and convenience of students are met by library, reading and smoking rooms refreshment-room &c The Club which is under the control of a Committee of Students provides needful athletic recreation and includes the Medical Society

Women Students —Women students are accepted by the School and Hospital upon the same terms and conditions as men and after qualification are eligible for resident Hospital appointments A separate common room and a female attendant are provided but beyond this no further distinction is made This system of co-education, under which men and women are placed on terms of complete equality throughout the whole of the curriculum has been found to work successfully and to their mutual advantage

Fees —An entrance fee of 10 guineas and 8 guineas is payable by full course and final course students respectively, culation examination or have been exempted therefrom under Statute 116 not less than five and a half years previously, (2) have passed subsequent examinations similar to those required of an internal student, and (3) have been engaged in professional studies during the five and a half years subsequently to Matriculation and four and a half years subsequently to passing the First Examination for Professional Degrees at one or more of the medical institutions or schools recognised by this University for the purpose, one year at least of the four and a half years to have been spent in one or more of the recognised institutions or schools in the United Kingdom

The First Examination for Medical Degrees (*Inorganic Chemistry, Physics, and General Biology*) will take place twice in each year, commencing on the Monday following Dec 10th and on the second Monday in July *It must* as a rule be passed by internal students not less than one academic year after matriculation and by external students not less than nine months after matriculation

The Second Examination for Medical Degrees (Part I) Organic Chemistry —This examination will take place twice in each year, commencing on the Thursdays following the *third Monday in March* and the second Monday in July No candidate will be admitted to this examination within six months of having passed the First Examination [During the continuance of the war only this examination will be held in December as well as in March and July]

The Second Examination for Medical Degrees (*Part II*) takes place twice in every year, commencing on the third Monday in March and on the first Monday in July The subjects of the examination are Human Anatomy and Embryology, Physiology, and Pharmacology, including Pharmacy and Materia Medica No candidate shall be admitted to the examination unless he has passed the First Examination for Medical Degrees at least 18 months previously, and has passed Part I of the Second Examination for Medical Degrees

The Third or M B , B S Examination —The M B , B S examination takes place twice in each year, commencing on the fourth Monday in October and on the first Monday in May No candidate except those who pass the Preliminary Science or First Examination for Medical Degrees before July will be admitted to this examination within three academic years from the date of passing in Anatomy and Physiology at the Second Examination (Part II), nor unless he has completed that examination together with prescribed courses of study or practice summarised below (1) Principles and Practice of Medicine, (2) Clinical Methods and Physical Diagnosis, (3) Insanity (with clinical demonstrations at a recognised Asylum), (4) Therapeutics, (5) Vaccination, (6) Principles and Practice of Surgery, (7) Operative Surgery, Surgical Anatomy, Practical Surgery, and the Administration of Anæsthetics, (8) Diseases of the Eye Ear, and Throat, (9) Lectures and Demonstrations on Midwifery and Diseases of Women, (10) Practical Midwifery, the conduct of at least 20 Labours, and practice as a Clinical clerk in Gynæcological work, (11) Pathology and Bacteriology, (12) work of the Post-mortem room, (13) Forensic Medicine, and (14) Hygiene He must also have attended the Medical and Surgical practice of a recognised hospital for two years and a course of instruction at a recognised Fever Hospital for two months[1] He must have had clinical instruction and must have held the posts of medical clinical clerk and surgical dresser for periods of six months each Candidates will be examined in Medicine (including Therapeutics and Mental Diseases), Pathology, *Forensic Medicine* and Hygiene, Surgery, Midwifery, *and Diseases of Women* The subjects may be divided into two groups—namely (1) Medicine, Pathology, *Forensic Medicine*, and *Hygiene*, and (2) Surgery, Midwifery, and Diseases of Women These groups may be taken either *separately or together* *The list* of candidates who have passed will be published in two parts—namely, an Honours list and a *Pass list* Bachelors of Medicine of this University who graduated in or before May, 1904, may obtain the B S degree by passing the Surgical part of the M B , B S examination.

Doctor of Medicine —The examination for this degree takes place twice in each year, commencing on the first Monday in December and on the first Monday in July Candidates may present themselves *for* examination in one of the following branches, namely (1) Medicine, (2) Pathology, (3) Mental Diseases, (4) Midwifery and Diseases of Women, (5) State Medicine, and (6) Tropical Medicine. Any candidate for the degree of M.D may transmit to the Registrar a thesis or published work having definite relation to the branch of Medicine in which he is a candidate, and if the thesis be approved by the examiners the candidate may be exempted from the written examination in that subject.

Master in Surgery —The examination for the degree of Master in Surgery takes place twice in each year and commences on the first Monday in December and on the first Monday in July

Fees —Matriculation £2, which will be returned if the candidate withdraws his name before the *last* day of entry Should he fail to present himself an additional £1 will be charged on subsequent presentation within eight months £2 will be charged on each subsequent entry At provincial examinations an additional fee of £1 *to* £3 is charged by the local authorities at the time *of* examination. First M B B S. Examination £5 for each entry to the entire examination, or £2 each subject if the examination is taken in parts Second M B , B S Examination Part I £2, repeated on each subsequent entry, Part II £8 for the whole examination For re examination in one subject £4 Third (Final) M B , B S Examination £10 for each entry to the whole examination and £5 for examination or re-examination in each group M D Examination £20, for re-examination £10 M S Examination As for M D

Full details of the prescribed curricula of study and the names of the recognised Internal and External Schools of the University, can be obtained free on application to the Academic Registrar, University of London, South Kensington S W

MEDICAL SCHOOLS OF THE UNIVERSITY OF LONDON[1]

ST BARTHOLOMEW'S HOSPITAL AND COLLEGE.—The hospital contains 757 beds, of which 687 are for patients in the hospital at Smithfield and 70 for convalescent patients at Swanley It receives over 8000 in patients annually and its out-patients and casualties amount to more than 78,000 annually Special departments have been organised for Diseases of Women and Children, the *Eye*, *Ear*, Larynx, and Skin, as well as for Orthopædic and Dental Surgery and for Electro therapeutics and X *Ray work* Surgical operations take place every day at 1 30 P M and Surgical Consultations are held on Thursdays at the same hour Medical Consultations are held on Thursdays at 3 15 P M The physicians and surgeons deliver clinical lectures weekly during both the winter and the summer sessions Clinical Lectures on all *special* subjects are also given The visits *of the physicians and surgeons* are made at 1 30

[1] For Ancillary Metropolitan Medical Schools see p 293

New Buildings —The new buildings comprise residential quarters for the resident staff, casualty, medical, surgical, and special out-patient departments, casualty wards, dispensary, and clinical lecture theatre A new chemical laboratory has been added to the Medical School, and a laboratory devoted to instruction in Public Health A second new block is devoted to Pathology, and contains the post mortem room as well as extensive laboratories for bacteriology, clinical pathology pathological histology, and pathological chemistry *The Medical School Buildings* include three large lecture theatres, a large dissecting room, a spacious library (containing 13,000 volumes), a well appointed museum of anatomy, physiology, comparative anatomy, materia medica, botany, and pathological anatomy The pathological museum is the most complete in the kingdom There are laboratories for chemistry, physiology, pharmacology, physics, public health, and biology, giving ample accommodation in every department

Special Classes for the Primary and Final F R C S are held twice yearly *Instruction in Preliminary Science* is given to University of London students in chemistry, biology, and physics throughout the year *Laboratory Instruction for the D P H* is provided during the winter and summer sessions

The recreation ground of 10 acres is at Winchmore Hill for the use of the members of the Students' Union, which all students are expected to join The Students' Union contains a large reading and smoking room, a committee and writing room, luncheon and dining hall, and a miniature rifle range

Staff —Consulting Physicians Sir William Church, Dr Hensley, Sir Dyce Duckworth, Dr N Moore, Dr S West, and Dr Ormerod. Consulting Physician Accoucheur Sir Francis Champneys Consulting Surgeon Mr H Cripps Consulting Aural Surgeon Mr Cumberbatch Physicians Sir Wilmot Herringham, Dr Tooth, F R S Dr Garrod F R S, Dr Calvert, and Dr H M Fletcher Surgeons Sir Anthony Bowlby, Mr D'Arcy Power, Mr Waring Mr McA Eccles, and Mr Bailey Physicians with charge of Out-patients Dr Drysdale and Dr Hartley Assistant Physicians Dr Horder, Dr Langdon Brown, and Dr Thursfield Surgeons with charge of Out-patients Mr Rawling, Mr Gask, and Mr G Watson Assistant Surgeons Mr H W Wilson and Mr W G Ball Physician Accoucheur Dr Griffith. Physician Accoucheur with charge of Out-patients Dr Williamson Assistant Physician Accoucheur Dr Barris Ophthalmic Surgeon Mr Holmes Spicer Assistant Ophthalmic Surgeon Mr Foster Moore Surgeon for Diseases of the Throat and Nose Mr Harmer Assistant Surgeon for Diseases of the Throat and Nose Mr Rose Aural Surgeon Mr C E West Assistant Aural Surgeon Mr S R Scott Dental Surgeons Mr Ackland and Dr Austen Assistant Dental Surgeons Mr F Coleman and Mr J G A Fairbank. Orthopædic Surgeon Mr Elmslie Physicians for Diseases of Children Dr Fletcher and Dr Thursfield Physician for Diseases of the Skin Dr Adamson Medical Officer in charge of Electrical Department Dr Cumberbatch Medical Officer to the X Ray Department Dr Walsham Pathologist Dr F W Andrewes F R.S Assistant Pathologist Dr Gordon Administrators of Anæsthetics Mr Cross, Mr Boyle, and Mr Trewby Medical Registrars Dr C M H Howell and Dr Gow Surgical Registrars Mr Blakeway and Mr Roberts Casualty Physicians Dr Feiling and Dr Trevan The staff deliver the lectures and demonstrations in their subjects

Other lecturers and demonstrators are —Practical Midwifery Dr M Donaldson Chemical Pathology Mr Wallis Practical Pathology Dr Stansfeld Mr Vick, Dr Canti, Mr Davis, Dr T H G Shore, and Mr Just Mental Diseases Sir R Armstrong-Jones Forensic Medicine Dr R A. Lyster Anatomy Dr Macphail Practical Anatomy Mr Stanley and Mr Moreton General Anatomy and Physiology Dr F A Bainbridge Practical Physiology Dr Trevan Materia Medica Pharmacology, and Therapeutics Dr Hamill Biology Dr Shore and Dr Cunnington Chemistry Dr Hurtley Practical Chemistry Dr Hurtley and Mr Cahen Physics Mr Womack Practical Physics Mr Womack and Mr Hopwood Public Health Dr Lyster Museum Curator Dr Andrewes Junior Curator Mr Armstrong Dean of the Medical School Dr Shore Warden of the College Mr W G Ball

Scholarships given in aid of Medical Study —At this school various Scholarships, prizes, &c, are given For five of the Scholarships and the Exhibition—namely, (*a*), (*b*), (*c*), three Entrance Scholarships of the respective values of £75, £75, and £150, (*d*) Entrance Scholarship in Arts, £100, (*e*) Jeaffreson Exhibition £50, and (*f*) Shuter Scholarship, £50—a full or University course at St Bartholomew's Hospital is required The awards of (*a*), (*b*), and (*c*) are made after examination in selections from the subjects of Chemistry, Physics, Zoology, Botany, Physiology, and Anatomy, (*d*) and (*e*) are awarded after examination in Latin, Mathematics, and Greek or French or German, (*f*) is awarded after competitive examination among Cambridge Graduates in Anatomy and Physiology These remaining Scholarships and prizes are as follows —Four Junior Scholarships (*g*) No 1, £30, Anatomy and Physiology, (*h*) No 2, £20, Anatomy and Physiology, (*i*) No 3, £25, Chemistry, Physics, and Biology, (*j*) No 4, £15, Chemistry, Physics, and Biology, (*k*) Senior Scholarship, £50, Anatomy, Physiology, and Chemistry, (*l*) Kirkes Scholarship, £30 and medal, Clinical Medicine, (*m*) and (*n*) two Brackenbury Scholarships, £39 each, one in Medicine and one in Surgery, (*o*) Sir G Burrows Prize, £10, Pathology, (*p*) Skynner Prize, 13 guineas, Regional and Morbid Anatomy, (*q*) Matthews Duncan Medal and Prize £20, Midwifery and Gynæcology, (*r*) Luther Holden Research Scholarship in Surgery awarded by election, £105, and (*s*) Lawrence Research Scholarship and gold medal in Pathology, awarded by election, £115

CHARING CROSS HOSPITAL —The Hospital, to which the School is attached, contains 300 beds Over 3000 cases pass through its wards each year, and some 24,000 out-patients and casualties are treated There are special departments for Mental Diseases, Midwifery, Diseases of Women, of Children, of the Skin, Eye, Ear, Throat, Nose, and Teeth for Orthopædic Cases X Ray work, and for Electrical Examination and Treatment

Appointments —In the Medical School Demonstratorships and Assistant Demonstratorships are open to students of the School. Medical, Surgical, and Obstetric Registrars to the Hospital are appointed annually Six House Physicians, six House Surgeons, and two Resident Obstetric Officers are appointed each year after competitive examination

Primary and Intermediate Studies —By an agreement with the University of London the School sends its Primary and Intermediate Students to receive their lectures and practical work at King's College, which is situated within four minutes' walk. This arrangement has proved most successful

Final Studies —These are taken in the school and hospital where systematic lectures demonstrations, and tutorial classes are arranged to cover all the subjects necessary for qualifying examinations Departments are also available for other final subjects of Bacteriology, Clinical Pathology, Materia Medica, Toxicology, Public Health, and Operative Surgery and also for Research Work and Post-graduate Work

The *Museum* contains over 4000 specimens, including a notable collection of over 800 gynæcological specimens, "The Cuthbert Lockyer Collection"

Students Club —The social comfort and convenience of students are met by library, reading and smoking rooms refreshment-room, &c The Club, which is under the control of a Committee of Students provides needful athletic recreation, and includes the Medical Society

Women Students —Women students are accepted by the School and Hospital upon the same terms and conditions as men and after qualification are eligible for resident Hospital appointments A separate common room and a female attendant are provided, but beyond this no further distinction is made This system of co-education, under which men and women are placed on terms of complete equality throughout the whole of the curriculum, has been found to work successfully and to their mutual advantage

Fees —An entrance fee of 10 guineas and 8 guineas is payable by full course and final course students respectively, and an annual fee of 26 guineas covers all other expenditure, with the exception of 7 guineas for vaccination, dispensing, and fever hospital attendance, which must be taken outside the hospital Membership of the Students' Club is included in these fees

Staff —Consulting Physicians Dr T H Green, Dr J Mitchell Bruce, and Dr F W Mott, F R S Physicians Dr J Galloway, Dr W Hunter, and Dr W C Bosanquet Assistant Physicians Dr W J Fenton, Dr D Forsyth, Dr R C Jewesbury, and Dr G Holmes Consulting Obstetric Physicians Dr J W Black and Dr A Routh Consulting Surgeons Mr J A Bloxam and Mr J H Morgan Surgeons Sir H F Waterhouse, Mr C Gibbs, and Mr H S Clogg Surgeons to Out-patients Mr P L Daniel and Mr W S Fenwick Assistant Surgeon (Vacant) Consulting Dental Surgeon Mr J Fairbank Ophthalmic Surgeon Mr E T Collins Obstetric Physician Dr T W Eden Assistant Obstetric Physician Dr C Lockyer Physician for Diseases of the Skin Dr J M H MacLeod Consulting Physician for Mental Diseases Dr C Mercier Physician for Mental Diseases Dr E D Macnamara Orthopædic Surgeon Mr H A. T Fairbank. Nose and Throat and Ear Surgeons Mr E B Waggett and Mr E D Davis Medical Officer Roentgen and Electrical Department Dr W Ironside Bruce Surgeon Dentist Mr J F Colyer Anæsthetists Mr C C Braine, Dr B E Potter, Mr H Hilliard, and Mr A de Prenderville Curators and Pathologists Dr R C Jewesbury and Dr G Holmes Bacteriologist Dr W W C Topley Morbid Histology Dr J W McLeod Medical Registrar Dr A W Oxford Surgical Registrar Mr H Gardiner Obstetrical Registrar Mr G Ley Resident Medical Officer Mr F W Collingwood

The lectures and demonstrations are delivered by the Staff on their respective subjects Other lecturers and demonstrators are —Tropical Diseases Sir Patrick Manson and Mr J Cantlie Medical Jurisprudence Dr W A Brend Toxicology Dr H F Morley

Further information may be obtained on application to the Dean, Dr W J Fenton, Medical School, Charing Cross Hospital, London, W C

ST GEORGE'S HOSPITAL —This hospital has a service of 436 beds, of which 180 are allotted to surgical, 150 to medical cases, and 100 are at the Convalescent Hospital at Wimbledon One ward is set apart for Diseases Peculiar to Women Children's beds are placed in all the women's wards Two wards are allotted to ophthalmic cases

Entrance Scholarships and Endowed Prizes of a total value of £482 are awarded annually, a detailed list is placed below The entire teaching and laboratories are now devoted to purely clinical subjects and arrangements have been made with the University of London for students who enter during the first, second, or third year of the curriculum as students of St George's to carry out the necessary courses of instruction at either University College or King's College Students then complete their course, without payment of any entrance fee, in a school entirely devoted to Clinical work. The school is admitting a strictly limited number of women students during the war These women students will be allowed to continue their studies until qualification

Eight house physicians and eight house surgeons are appointed annually All house appointments are open without fee to every perpetual student of the hospital and are made strictly in accordance with the merits of the candidates Special attention is directed to the following paid appointments, among others, which are open to students after they have held house office —Medical Registrarship at £200 per annum, Surgical Registrarship at £200, Assistant Curatorship of the Museum at £100, Obstetric Assistantship (Resident) at £50, the post of Resident Anæsthetist at £100, the post of Senior Anæsthetist at £50; the posts (3) of Junior Anæsthetists, each at £30 Great attention is paid by members of the staff to individual teaching A number of special courses are given in which the requirements of university and other examinations receive careful attention Special classes are held by members of the staff for all examinations The St. George's Hospital Club, with smoking and luncheon rooms on the hospital premises, and an athletic ground at Wimbledon, is an amalgamation of the Hunterian Society, the *Gazette*, and the chess, lawn tennis, boxing, hockey, rifle, and golf clubs Students have the advantage of a library of medical and scientific books which is kept up to-date Further information may be obtained from the Dean of the Medical School.

Staff —Consulting Physicians Dr T T Whipham, Sir Isambard Owen, and Dr W Ewart. Consulting Surgeons Mr Pick, Mr Haward, Sir W Bennett, Mr Marmaduke Sheild, and Mr F Jaffrey Consulting Obstetric Physician Dr W R Dakin Consulting Ophthalmic Surgeons Mr. Brudenell Carter and Mr Adams Frost Consulting Aural Surgeons Sir William Dalby and Mr W C Bull Consulting Dental Surgeon Mr Winterbottom. Consulting Bacteriologist Dr Charles Slater Physicians Dr H. D Rolleston, Dr C Ogle, Dr A Latham, and Dr J S Collier Obstetric Physician Dr A. F Stabb Assistant Physicians Dr A. J Jex Blake, Dr Golla, and Dr Torrens Assistant Obstetric Physician Dr Darwall Smith Physician to the Skin Department Dr W S Fox Surgeons Mr G R. Turner, Mr Pendlebury, Mr T Crisp English, and Mr W F Fedden Ophthalmic-Surgeon Mr H B Grimsdale. Assistant Ophthalmic Surgeon Mr R R James Assistant Surgeons Mr I Back, Mr C H Frankau, and Mr G A Ewart Surgeons to the Throat and Ear Department Mr. H S Barwell and Mr L Colledge Dental Surgeon Mr N G Bennett Assistant Dental Surgeon Mr Morley Honorary Bacteriologist Dr H Spitta, M V O

The staff deliver the lectures in the respective subjects assisted by the following lecturers and demonstrators — Tropical Medicine Dr C W Daniels Vaccination Mr E Climson Greenwood Mental Diseases Dr J C Woods. Public Health Mr C M Fegen Hygiene Dr H Spitta. Toxicological Chemistry Mr Gardner Pathological Chemistry Dr Golla Pathology and Forensic Medicine Dr R S Trevor Bacteriology and Clinical Pathology Dr E L Hunt Teacher of Anæsthetics Dr Blomfield. Assistant Teachers of Anæsthetics Dr Powell, Dr Longhurst and Dr Horne Advanced Physiology and Histology Dr G A Buckmaster Obstetric Tutor Dr D W Roy Medical Tutor Dr Helen Ingleby Surgical Tutor Mr J Ellison Dean of the Medical School and Curator of the Museum Dr R Salusbury Trevor

Scholarships and Prizes —At this school two entrance scholarships are given, the money value and the subjects of examination being as follows (*a*) and (*b*) two University Entrance Scholarships, 70 guineas and £50 respectively, Anatomy and Physiology The others are as follows (*c*) William Brown Exhibition, tenable for two years and open to perpetual pupils having registrable qualifications, £112 per annum, Practice of Medicine, Midwifery, and Surgery, (*d*) William Brown Exhibition, tenable for three years and open to perpetual pupils qualified not more than three years previously, £42 per annum, Essay and Original Work, (*e*) Allingham Scholarship in Surgery for Students qualified not more than three years, £50, Competitive Essay, (*f*) and (*g*) two Brackenbury Prizes, one in Medicine and one in Surgery, £30 each, open to students of not more than five years' standing, (*h*) H C Johnson Memorial Prize, £15, Practical Anatomy, (*i*) Pollock Prize, £17, Physiology, Physiological Chemistry, and Histology, (*j*) Clarke Prize, £5, (*k*) Thompson Medal, £5, Clinical Reports, (*l*) Brodie Prize, £7, Clinical Reports, (*m*) Webb Prize, open to perpetual pupils, £30, Bacteriology

---

GUY'S HOSPITAL —This hospital, founded by Thomas Guy in 1721 for the reception of 400 patients, and enlarged through the aid of a large bequest from the late William Hunt, contains at the present time 643 beds The school buildings have been rebuilt and now offer very complete accommodation Within the grounds of the hospital are situated the residential college, with accommodation for 60 students the students' club with reading, smoking, luncheon, and dining rooms, a fives court, and swimming bath The athletic ground and club house is situated at Honor Oak Park, and can be reached in 20 minutes from the hospital

House physicians, house surgeons, out-patient officers and assistant house surgeons, obstetric residents, ophthalmic house surgeons, clinical assistants, clerks to anæsthetists, surgeons' and assistant surgeons' dressers, surgical and medical clinical clerks, post-mortem clerks, extern obstetric attendants, and dressers and clerks in the special departments are appointed from among the students upon the recommendation of the medical council according to merit

There is a Medical Section of the Officers' Training Corps of the University of London in connexion with the Hospital Drill is held in the grounds of the Hospital so that the senior students can carry out the necessary military training without any serious interruption of their work in the wards The establishment of a Venereal Clinic, in accordance with the Scheme of the Local Government Board and London County Council. Lectures and clinical instruction are given to which Medical Students and Practitioners are admitted without fee Residential College the rent of rooms remains the same, but the cost of board has increased

Medical and Surgical Staff and Lecturers —Consulting Physicians Sir F Taylor, Dr Newton Pitt and Sir Cooper Perry Consulting Surgeons Mr W H A Jacobson, Mr Golding Bird, Mr C J Symonds, and Sir W Arbuthnot Lane, Bart Consulting Physician for Mental Diseases Sir George Savage Consulting Aural Surgeon Mr W Laidlaw Purves Consulting Physician for Skin Diseases Sir Cooper Perry. Consulting Anæsthetists Mr Tom Bird and Dr H. F Lancaster Consulting Ophthalmic Surgeons Mr C Higgens and Mr W A. Brailey Consulting Dental Surgeons Mr Newland Pedley and Mr W A. Maggs Physicians and Assistant Physicians Dr W Hale White, Dr L E Shaw, Dr J Fawcett, Dr A. P Beddard, Dr H S French, Dr A. F Hurst Dr H. C Cameron, Dr G H Hunt, and Dr E P Poulton. Surgeons and Assistant Surgeons Mr L A. Dunn, Sir Alfred Fripp, Mr F J Steward Mr C H. Fagge, Mr R P Rowlands, Mr Philip Turner, Mr E C Hughes, Mr R Davies-Colley, and Mr L. Bromley Obstetric Physicians Mr G Bellingham Smith and Mr H. Chapple Ophthalmic Surgeons Mr H. L. Eason and Mr A W Ormond. Physician in Charge of Nervous Diseases Dr Hurst Physician in Charge of Children Dr Cameron. Physician in Psychological Medicine Dr Maurice Craig Surgeon in Charge of Genito-Urinary Department Mr A. R Thompson. Surgeons in Charge of Throat and Ear Department Mr W M. Mollison and Mr T B Layton. Surgeon in Charge of the Orthopædic Department Mr W H Trethowan. Surgeon in Charge of the Actino-Therapeutic Department Dr C E Iredell Dental Surgeons Mr R. Wynne Rouw, Mr H L. Pillin Mr M. F Hopson, and Mr J B Parfitt Anæsthetists Mr G Rowell, Mr C J Ogle, Dr F E Shipway Mr H M Page, Mr A. J McNair, and Mr A. M Zamora. Medical Registrars and Tutors Dr N Mutch, Mr H W Barber, and Mr Heaton Surgical Registrars and Tutors Mr A. H Todd, Mr G T Mullally, Mr R. C Ozanne, and Mr E G Schlesinger Radiographers Mr E W H Shenton and Dr Lindsay Locke. Bacteriologist to the Hospital Dr J W H Eyre. Resident Surgical Officer Mr W E Tanner Hon. Librarian Wills Library Dr H S French. Lying in Charity Mr Bellingham Smith and Mr Chapple. Dean of the Medical School Sir Cooper Perry Sub-Dean Dr Pembrey

Lecturers and Demonstrators in Special Subjects —Anæsthetics Mr Rowell. Hygiene and Public Health Dr R King Brown Pathology Dr P P Laidlaw Morbid Anatomy Dr French, Dr Cameron, and Dr Hunt Morbid Histology and Bacteriology Dr Eyre, Dr Laidlaw, and Dr Goodhart Medical and Surgical Pathology Classes Dr Hunt and Mr Davies-Colley Bacteriology Dr Eyre Practical Bacteriology Dr Eyre. Forensic Medicine Mr Ryffel. Anatomy Mr Rowlands and Mr Turner Practical Anatomy Mr Bromley and four Demonstrators Physiology Dr Pembrey Practical Physiology Dr Pembrey and two Demonstrators Materia Medica and Therapeutics Dr A F Hurst Pharmacology Dr A. J Clark. Practical Pharmacy the Hospital Pharmacist Chemistry Professor Martin Lowry, F R S Practical Chemistry Professor Lowry, and Demonstrators. Experimental Physics Dr Fison and Mr Abram Biology Mr Evans and Mr Reed. Psychology Dr Craig

Scholarships —Five entrance scholarships are awarded annually as follows —(*a*) one scholarship of £100 for students under 21 years of age Latin English, Greek or French or German, Arithmetic Euclid, and Algebra, (*b*) one scholarship for students under 21 years £120, Inorganic Chemistry, Physics, and Biology, (*c*) a Scholarship of £50, open to candidates under 21 years of age, to be awarded either in Arts or in Science, according to the discretion of the Examiners, and to the percentage of the marks obtained, (*d*) two scholarships, one of £75 and one of £35, for students under 25 years of age who have completed the curriculum for, or passed the examination in, Anatomy and Physiology for a medical degree in any University of the British Empire Subjects Any two of the following Anatomy, Physiology, Pharmacology, General Pathology, Organic Chemistry

In agreement with the practice of the Universities, an allowance will be made (1) for Military Service performed by candidates, the term ' military service" meaning service in the Naval or Military Forces of His Majesty or of His Majesty's Allies during the present War, or (2) in respect of other approved duties in connexion with national defence

---

UNIVERSITY OF LONDON KING'S COLLEGE.—The medical department (Faculty of Science, Medical Division) at this College only deals with Preliminary and Intermediate subjects, and instruction in these subjects is given in the College laboratories by university professors and their assistants The following four hospital schools prepare their students only for the final examinations—viz., King's College Hospital Westminster Hospital, St George's Hospital, and Charing Cross Hospital—sending them to King's College for the earlier part of the curriculum The department is open to both men and women

The following are the teachers in the subjects concerned — Anatomy Dr E Barclay Smith (Professor) Dr R. J Gladstone, F R.S E, and Demonstrators Physiology Dr W D Halliburton, F R S (Professor), Dr Rosenheim and Dr Locke (Readers), and Dr de Souza (Lecturer) Psychology Dr W Brown (Reader) Pharmacology Dr W E Dixon (Professor) Zoology Dr A. Dendy (Professor) Botany Dr W B Bottomley (Professor) Chemistry Mr H Jackson (Daniell Professor), Dr Crossley (Professor), Mr P H. Kirkaldy (Assistant Professor), with Lecturers and Demonstrators Physics Dr O W Richardson (Wheatstone Professor), with Lecturers and Demonstrators

Fees —For London University course For First examination for medical degrees, 25 guineas, for the Second examination 58 guineas, or two instalments of 30 guineas each. For Conjoint Board course For First examination, 20 guineas, for Second examination, 58 guineas, or two instalments of 30 guineas each. For prospectus and further information application should be made to the Dean of the department (Professor Halliburton)

KING'S COLLEGE HOSPITAL MEDICAL SCHOOL.—The advanced subjects in the curriculum are dealt with at the Medical School attached to King's College Hospital, which is situated at Denmark Hill, S E The hospital stands in the midst of a South London population, from which an immense amount of clinical material is forthcoming, an average of 3500 out-patients being dealt with weekly There are 350 beds available for in patients, and provision will ultimately be made for 600 beds Special departments are provided for the following diseases of women and children, the eye ear, throat and nose, skin, teeth, radiography, radio-therapy and radium therapy, massage, medical gymnastics and electro-therapeutics There are special operation theatres for diseases of women, for eye, throat, nose and ear cases, and a laboratory in the hospital where histological, bacteriological, hæmatological, and chemical investigations are carried out The appointments open to students are those of senior clinical assistant to the special departments, medical, surgical, and obstetric tutorships, resident casualty officer, resident anæsthetist, resident assistant pathologist, and medical, surgical, and obstetric registrarships There are 16 resident medical and surgical officers appointed yearly, and the usual senior surgical dressers medical and obstetric clinical clerks surgical dressers, clerks and dressers in all the special departments for in and out-patients, and post-mortem clerks

Hospital Staff —Consulting Physicians Dr Greville MacDonald, Sir David Ferrier F R.S, and Sir Hugh Beevor Consulting Surgeon Mr A. B Barrow Consulting Aural Surgeon Dr Urban Pritchard. Physicians Sir Nestor Tirard, Dr Norman Dalton, Dr Raymond Crawfurd Dr

Aldren Turner, Dr F W Tunnicliffe, and Dr J C Briscoe Assistant Physician Dr H W Wiltshire Surgeons Sir W Watson Cheyne, F R S, Mr A. Carless, Mr F F Burghard, and Mr G L Cheatle Assistant Surgeons Mr T P Legg and Mr Arthur Edmunds Obstetric and Gynæcological Surgeon Dr Hugh Playfair Assistant Obstetric and Gynæcological Surgeon Dr W Gilliatt. Physician for the Diseases of Children Dr George F Still Assistant Physician for Diseases of Children Dr R S Frew Surgeon for Diseases of the Throat Sir StClair Thomson Assistant Surgeon for Diseases of the Throat Dr C W M Hope Ophthalmic Surgeon Mr L V Cargill Assistant Ophthalmic Surgeon Dr H Willoughby Lyle Aural Surgeon Mr Arthur H Cheatle Assistant Aural Surgeon Mr G J Jenkins Physician for Diseases of the Skin Dr A Whitfield Physician for Tropical Diseases Sir Ronald Ross Dental Surgeon Mr C E Wallis Anæsthetists Dr J F W Silk and Dr G B Flux. Assistant Anæsthetist Mr Cecil Hughes Radiographer Dr Robert Knox Director of Department of Pathology Dr d'Este Emery Pathological Registrar Mr H A. Burridge Medical Tutor Dr A. S Woodwark Surgical Tutor Mr E G Gauntlett Obstetric Tutor Dr W Gilliatt Sambrooke Registrars Dr G W Shore and Mr J Everidge Obstetric Registrar Mr A C McAllister

Other lecturers are —Psychological Medicine Dr Steen Forensic Medicine Dr W R Smith Hygiene Dr W J R Simpson Surgical Applied Anatomy Mr G J Jenkins

Fees —The composition fee for Hospital work and Final subjects of the curriculum is 70 guineas if paid in one sum, or 72 guineas if paid in two instalments For information and prospectus application should be made to Dr H W Lyle, Dean of the Hospital, or to Mr S C Ranner, M A, Secretary of the Medical School, Denmark Hill, S E

Scholarships and Prizes —For the first two scholarships in the list here shown a complete course at King's College is required The money value and subjects of examination are as follows —(*a*) Two Warneford Scholarships, tenable for four years, £25 each per annum, (*b*) Sambrooke Scholarship, £50, (*c*) Rabbeth Scholarship, £20, (*d*) Medical Entrance Scholarships, £50, Anatomy and Physiology, and, £50, Pathology and Pharmacology, open to students who (1) propose to take a degree at any British University and have passed their University examination in Biology, Chemistry, and Physics, and who (2) will become students at King's College Hospital from date of entering upon Scholarship, (*e*) Two Medical Entrance Scholarships one in Arts and one in Science, £50 each, tenable for five years, successful candidates to study at King's College and King's College Hospital, (*f*) Three Medical Scholarships, £40 for fifth year students, £20 for third-year students, and £20 for second year students, (*g*) Two Sambrooke Registrarships, open to matriculated students who have filled certain appointments in hospital, £50 each, (*h*) Carter Prize, £15, Botany, (*i*) Tanner Prize, £10, Obstetrics and Diseases of Women, (*j*) Todd Prize, £4 4*s* and medal, Clinical Medicine, (*k*) Two Burney Yeo Entrance Scholarships, £80 each, open to students of Oxford and Cambridge

Athletics —The King's College Hospital Clubs and Societies Union was formed in 1908, and consists of the Listerian and Musical Societies, the Hospital Common Room, and the various athletic and sports clubs Admirable playing fields, over six acres in extent, have been provided for the use of the students on Dog Kennel Hill, Lordship-lane, S E, about ten minutes' walk from the hospital There are also Tennis Courts in the grounds of the Hospital and of "The Platanes," the hall of residence for students belonging to the hospital.

LONDON HOSPITAL.—The hospital has 922 beds in constant use and no beds are closed It is the only general hospital for East London—i e., for a million and a half people In patients last year, 17,637, out-patients, 130,831, accidents, 7814, major operations 6160 From the beginning of the war to the close of 1916 3947 military patients were admitted, while naval patients (who were first admitted at the end of September) totalled 384 Wards containing 15 beds have recently been provided for the treatment of syphilis, and 620 patients were admitted for treatment during 1916 Owing to the enormous number of patients more appointments are open to students than at any other hospital 141 qualified appointments are made annually and more than 150 dressers, clinical clerks, &c., appointed every three months. All are free to students of the College Holders of resident appointments have free board. Special classes are held for the degrees of the University of London, the Fellowship of the Royal College of Surgeons, and other higher examinations Special entries for medical and surgical practice can be made The Students' Hostel provides accommodation for 30 students The Clubs Union Athletic Ground is within easy reach of the hospital. The Metropolitan and other railways have stations close to the hospital and the college

Staff —Consulting Physician Dr F Warner Consulting Surgeons Mr Couper, Mr McCarthy, Sir Frederick Treves, Mr Warren Tay, Mr Mansell Moullin, Mr Hurry Fenwick, and Mr Dean Consulting Obstetric Physician Dr Lewers Consulting Dental Surgeon Mr Barrett Consulting Aural Surgeon Mr Mark Hovell. Physicians Dr Percy Kidd, Dr Frederick J Smith, Dr W J Hadley, Sir Bertrand Dawson, Dr Henry Head, F R S, Dr Robert Hutchison, Dr Lewis Smith, Dr Cecil Wall, Dr O Leyton, and Dr T Thompson Assistant Physician Dr C H Miller Surgeons Mr J Hutchinson, Mr T H. Openshaw, Mr P Furnivall, Mr Rigby Mr Sherren, Mr Lett, Mr Russell Howard and Mr R Warren Assistant Surgeons Mr Frank Kidd, Mr R Milne, Mr A. J Walton, and Mr H S Souttar Obstetric Physician Dr H R Andrews Assistant Obstetric Physician Dr. E L Holland Physician to Cardiac Department Sir James Mackenzie, F R S Demonstrator Dr J Parkinson. Physician to the Skin and Light Department Dr J H Sequeira. Ophthalmic Surgeons Mr A. B Roxburgh and Mr W T Lister Surgeon to the Throat Department Dr Lambert Lack Demonstrator Dr. N Patterson Aural Surgeon Mr Hunter Tod. Surgeon in charge of the Orthopædic Department Mr T H Openshaw Dental Surgeons Mr H Chapman, Sir Francis Farmer, Mr G Northcroft, Mr Paton Pollitt, Mr Evelyn Sprawson, and Mr Wilton Thew Medical Officer in charge of the Radiographic Department Dr Gilbert Scott Medical Officer in charge of the Electro- and Physico-Therapeutical Departments Dr R S Woods Analyst to the Hospital Mr Hugh Candy Demonstrator in Chemistry Mr J F Twort Bacteriologist to the Hospital Professor W Bulloch, F R S Assistant Bacteriologist Dr P Fildes Demonstrator Dr L. W Rajchman. Inoculation Department Dr G T Western. Pathological Institute Dr H M Turnbull, Director, Dr G B Bartlett, Assistant Director, Dr W W Woods, Junior Assistant Director Clinical Pathologist Dr P N Panton, Assistant, Dr H L Tidy Anæsthetists Dr Probyn Williams, Mr Clapham, and Mr Daly Assistant Anæsthetists Dr Austin Cooper and Mr J D Lyle

The staff deliver the lectures and demonstrations in their subjects Other lecturers and demonstrators are Anatomy Professor W Wright, Dr N C Rutherford, and Mr L J Austin Physiology and Histology Professor E. P Cathcart and Mr I Feldman Physics Dr A. H. Fison and Mr W A M Smart Biology Mr G P Mudge and Mr G T Cunningham Mental Diseases Dr. J Kennedy Will Materia Medica and Pharmacy Dr E. Mellanby and Mr F A. Hocking Aural Surgery Dr F F Muecke Obstetric Tutor Dr S G Luker Dean Professor William Wright, M B, D Sc, F R C S Secretary of College Mr E J Burdon

Scholarships and Prizes —At this school the successful candidates for the first items in the list here shown must enter as full students. The value and the subjects of examination are as follows —Price Scholarship £100, and one Entrance Scholarship of £50, subjects of First Medical Examination at the University of London, Epsom College Scholarship, free education, subjects of First Medical Examination as above, Price Scholarship, open to students of Oxford and Cambridge Universities, £52 10*s*, Human Anatomy and Physiology, Buxton Scholarship, £31 10*s*, subjects of Preliminary Examination in Arts, three Scholarships for Clinical Work, £20 each, Medicine, Surgery, and Obstetrics, Sutton Prize, £20, Pathology, Duckworth Nelson Prize, biennial, £10, Pathology, Practical Medicine, and Surgery, Letheby Prizes (2), £25, Chemistry, £25 in Anatomy and Physiology; eight Dressers' Prizes, amounting to £40, zeal efficiency, and knowledge of Elementary Clinical and Minor Surgery, Hutchinson Prize, triennial, £40, Clinical Surgery, two

Practical Anatomy Prizes, £6 and £4 respectively, Andrew Clark Prize, biennial, £26 Clinical Medicine and Pathology, James Anderson Prizes, £9, Elementary Clinical Medicine, Wynne Baxter Prize, £5 5*s*, Forensic Medicine, Arnold Thompson Prize, £5, and Liddle Prize, triennial £120

Medical Research Funds.—Research Funds of £23,000, including the Eliza Ann Alston Endowment Fund for Medical Research, provide valuable scholarships for men wishing to undertake research or desirous of preparing Theses for University degrees

The above arrangements are subject to revision in consequence of circumstances arising out of the war

---

ST MARY'S HOSPITAL.—305 beds The number of in-patients treated during 1916 was 3288 The number of out-patients was 14,746 with 19,158 casualty cases, a total of 33 904 The situation of the hospital and Medical School in the centre of the residential districts of Paddington, Bayswater, and North Kensington renders it exceptionally convenient for students' rooms, a register of which is kept by the authorities for the use of students

Laboratories, &c—The Medical School provides for the entire curriculum. Special laboratories are in use for Biology Chemistry, and Physics, a series of lecture theatres and laboratories for Anatomy and Physiology, and a spacious and well lighted dissecting room. The Pathological Department is under the direction of Dr B H. Spilsbury, and a block of consulting rooms and laboratories in the New Wing of the Hospital has been equipped for the department of Therapeutic Inoculation

Appointments—All clinical appointments in the hospital are free to students of the Medical School and the resident medical officers are chosen by competitive examination. Six house physicians, six house surgeons, four obstetric officers and two Resident Medical Officers for the Inoculation Wards are appointed in each year and receive board and lodging in the hospital. Two resident anæsthetists are appointed in each year and receive a salary at the rate of £100 per annum, with board and lodging Four casualty house surgeons are appointed in each year upon the same conditions Several assistants in the department of Therapeutic Inoculation are appointed annually at salaries of £100 per annum and upwards In addition to the above, the senior appointments medical, surgical, and obstetric registrar, casualty physician, demonstrator of anatomy, physiology, and biology are made annually Two assistant pathologists are also appointed annually and are eligible for re-election.

Clubs, &c—The amalgamated clubs include all the various athletic clubs as well as the medical society, &c. There is a students' club on the Hospital premises, the membership of which is included in the amalgamated clubs The athletic clubs ground is situated at Park Royal, Acton and is easy of access from the Medical School. At the present time the pavilion and the greater part of the ground have been commandeered by the War Office.

Special Tuition—Special tuition is provided for the Intermediate and Final Examinations of the Universities of Oxford, Cambridge and London and for the Primary and Final F R.C S

The composition fee for full students is £140 if paid in one sum, or £145 if paid in four instalments University students who have completed their examinations in Anatomy and Physiology are admitted on payment of a composition fee of 65 guineas (£68 5*s*) paid in one sum or by payment of two annual instalments of 40 guineas (£42) and 30 guineas (£31 10*s*) respectively A system of annual fees is also in force as an alternative to composition fees Separate courses of lectures laboratory work, or hospital practice may be taken. The School Calendar and full information can be obtained from the Secretary St Mary's Hospital Medical School Paddington, W

Staff—Consulting Physician Dr Luff. Consulting Surgeons Mr Herbert Page, Mr A. J Pepper Sir G Anderson Critchett and Mr H E Juler (Ophthalmic) Sir Malcolm Morris (Skin) Dr Scanes Spicer (Throat) and Dr M Handfield Jones (Obstetric) Consulting Anæsthetist Mr Henry Davis Physicians Dr Sidney Phillips Dr Wilfred Harris and Sir John Broadbent. Surgeons Mr J Ernest Lane Mr Warren Low, and Mr W H Clayton Greene. Physicians in charge of Out-Patients Dr W H Willcox, Dr R. H Miller, and Dr F S Langmead. Surgeons in charge of Out-Patients Mr Maynard Smith, Mr Fitzwilliams, Mr V Z Cope, and Mr C A. Pannett (supernumerary) Obstetric Surgeon Mr T G Stevens Obstetric Surgeon in charge of Out-Patients Mr A. W Bourne Physician in charge of Children's Department Dr Sidney Phillips Ophthalmic Surgeons Mr Leslie Paton, Mr F A. Juler Physician to the Skin Department Dr Graham Little Physician to Department for Nervous Diseases Dr Wilfred Harris Physician to Department for Mental Diseases Dr R H Cole Dental Surgeon Mr W H Dolamore Surgeons to the Ear, Nose, and Throat Department Dr G William Hill and Mr O I Graham (assistant) Administrators of Anæsthetics Mr Henry Chaldecott, and Mr Phillips Director in Medical Charge of Inoculation Department Sir Almroth Wright, C B Assistant Director Captain S R Douglas, I.M.S Medical Officer in charge of X Ray Department Dr Harrison Orton Dean Sir John Broadbent

The staff deliver the lectures in the respective subjects, assisted by the following lecturers and demonstrators — Pathology Dr Spilsbury and Dr Kettle Bacteriology Dr Freeman, Mr Fleming and Dr Nias Demonstrator in Pathological Chemistry Mr J Webster Descriptive and Surgical Anatomy Professor J Ernest Frazer, Demonstrators Dr R H Robbins and Mr Kenneth Lees Physiology and Histology Dr H E Roaf and Dr Ellison Biology Mr W Bushton Chemistry Dr P Haas demonstrator, Mr J O F Fletcher Physics Mr W H White. Mental Diseases Dr R H Cole Diseases of the Eye Mr Leslie Paton and Mr Juler Surgical Registrar Mr K. A. Lees Practical Pharmacy Mr E A. Andrews. School Secretary Mr B E Matthews

Scholarships and Prizes—The money value and subjects of examination of these are as follows (*a*) and (*b*) Entrance Scholarships in Natural Science, £100 and £50 respectively, awarded by competition in September, (*c*) the Frederic John Palmer Scholarship in Natural Science £25, (*d*) University Scholarship in Natural Science, open to members of Oxford or Cambridge University, £52 10*s*, (*e*) University Scholarship in Natural Science, open to members of any British University £52 10*s*, (*f*) Epsom Scholarship, awarded by nomination, £52 10*s*, (*g*) Gold Medal, £20 an Essay on Some Special Point in Clinical Medicine, (*h*) Meadows' Prize awarded in alternate years, £8, Obstetrics, (*i*) Wallace Memorial Prize and Medal, for work in Vaccine Therapy, £5 5*s*

MIDDLESEX HOSPITAL.—The Hospital and Medical School are situated in Mortimer street, at the top of Berners-street, and only a few minutes' walk from Goodge-street Station (Hampstead and Charing Cross Tube), Oxford Circus Stations (Bakerloo and Central London Tubes), and Great Portland street Station (Metropolitan Railway)

The hospital contains 449 beds, including special wards for Cancer Cases Maternity and Gynæcological Cases, and for Diseases of Children and the Skin and Eye.

The Cancer Charity, containing 92 beds and Special Investigation Laboratories, offers unrivalled opportunities for the study of Cancer, both in its clinical and pathological aspects

In the Electro-Therapeutical Department students obtain instruction in the Treatment of Lupus and Cancer by the X Ray method of treatment An Electrocardiograph Department has recently been established.

The Hospital and Medical School are fully equipped for the theoretical and practical teaching of all the subjects of the medical curriculum, and for the Diplomas in Public Health. Ample laboratory and class room accommodation is provided

The Bland Sutton Institute of Pathology contains a new lecture theatre and large pathological, bacteriological, and clinical laboratories where every facility is given for original research. The Anatomical and Pathological Museum is now part of the Institute Special classes are held to prepare students for the Intermediate examinations of the Universities and for the Primary and Final examinations for the F R.C S (England) Diploma. There is a Residential College in the hospital for students

Hospital Appointments—All appointments are made without fee of any kind, and the following are appointed at intervals annually six house physicians eight house surgeons, two obstetric and gynæcological house surgeons, two casualty medical officers, two casualty surgical officers, and two resident officers to the special departments The medical and surgical casualty officers are appointed twice a year The medical, surgical, and obstetric and gynæcological registrars are appointed as vacancies arise

Non resident qualified clinical assistants are appointed to assist in the various out-patient departments Clinical clerks and surgical dressers are also appointed in every department

Scholarships, Prizes, &c —(*a*), (*b*), and (*c*) Three Entrance Scholarships, value £100, £50, and £25, and (*d*) a University Scholarship, value £50 are awarded annually in September The successful candidates are required to become general students of the school (*e*) A Freer Lucas Scholarship for Students of Epsom College is awarded annually on the nomination of the Headmaster There are also, (*f*) and (*g*), two Broderip Scholarships, value £60 and £40 respectively, (*h*) the Lyell Gold Medal and Scholarship, value £55 5*s*, (*i*) the John Murray Medal and Scholarship, value £25 (awarded every third year), (*k*) the Freeman Scholarship, value £30, (*l*) the Hetley Clinical Prize value £25, (*m*) the Leopold Hudson Prize, value 11 guineas, and (*n*) the Second Year's Exhibition, value 10 guineas There are also numerous class prize examinations [2]

In connexion with the Cancer Investigation Department the following Scholarships are awarded —Richard Hollins Research Scholarship, value £105, Salters' Company Cancer Research Scholarship, value £100, Walter Emden Scholarship, value £100, and a Cancer Research Scholarship, value £60

Fees —The Composition Fee for the curriculum for the diplomas of the Conjoint Board or Society of Apothecaries is 135 guineas, for the curriculum for the degrees of the University of London 145 guineas, for students who have passed the First Examination for Medical Degrees (University of London) 120 guineas, and for those who have completed their Anatomical and Physiological studies, 70 guineas The fee for Dental students is 54 guineas The fees may be paid by instalments

The Amalgamated Students' Club includes the following the Medical Society, the Common Room Society, the cricket club, the football clubs, the athletic club, the rowing club, the musical society, the chess club, the lawn tennis club, and the hockey club The athletic ground, which is eight acres in extent, is situated within easy access of the hospital—at Park Royal There is a gymnasium within the precincts of the hospital. A subscription to the Amalgamated Students' Club is payable by all General and Dental students

Medical and Surgical Staff —Consulting Physicians Dr Sidney Coupland, Sir Richard Douglas Powell, and Sir James Kingston Fowler Consulting Surgeons Sir Henry Morris and Sir Alfred Pearce Gould Con sulting Obstetric Physician Dr W Duncan Consulting Physician to the Skin Department Dr Liveing Consulting Ophthalmic Surgeon Mr Lang Consulting Surgeon to the Ear and Throat Department Mr Stephen Paget Consult- ing Dental Surgeons Mr W Hern and Mr W S Nowell Physicians Dr Pasteur, Dr Wynter, Dr Voelcker, and Dr Wethered Surgeons Sir John Bland Sutton, Mr Murray, Mr Kellock, and Mr W Sampson Handley Physician and Assistant Physician to the Department for Skin Diseases Dr Pringle and Dr MacCormac Physician to the Department for Nervous Diseases Dr Campbell Thomson (Dean of the Medical School) Obstetric and Gynæ- cological Surgeon and Assistant Obstetric and Gynæcological Surgeon Mr Berkeley and Mr Bonney Physician to Out- patients Dr Young Surgeon to Out-patients Mr G Taylor Assistant Physicians Dr Lakin, Dr MacCormac, and Dr Cockayne Assistant Surgeons Mr Webb-Johnson and Mr C H S Webb Ophthalmic Surgeon and Assistant Ophthalmic Surgeon Mr Lawson and Mr Greeves Surgeon to the Ear, Nose, and Throat Department Mr Somerville Hastings Dental Surgeon and Assistant Dental Surgeon Mr Turner and Mr James Anæsthetists Mr T G A. Burns, Mr H Charles, and Mr R E Apperly Assistant Anæsthetist (Resident) Mr Mason Registrars Dr G E Beaumont, Mr A. W Woo, Mr R O Fisher, and Dr Morson Resident Medical Officer Dr D R C Shepherd

The staff deliver the lectures and demonstrations in their respective subjects Other lecturers are Psychiatry Dr James Chambers Bacteriology under the supervision of the director of the Bland Sutton Institute of Pathology, Dr C H Browning Anatomy and Embryology Dr Yeates Physiology and Biology Dr Strickland Goodall. Chemistry and Physics Dr A. M. Kellas.

ST THOMAS'S HOSPITAL —This hospital received its present charter from King Edward VI, but as a monastic institution was in existence prior to the year 1207 The building occupies a unique position by the river, opposite the Houses of Parliament, and contains 1014 beds, including 530 for military patients The in patients last year numbered 9659, whilst the number of attendances as out-patients, including the casualty and light departments, was 234,812 There are special departments for the treatment of women, children, the eye, ear, nose and throat, skin, and teeth The Tuberculosis Department forms a part of the Lambeth scheme for treatment of patients and for instruction The Venereal Department has been established as part of the London County Council scheme Departments for light treatment, X rays, and the Physicotherapeutic Department are also special features A speech clinic has recently been inaugurated in connexion with the Children's Department Exceptional facilities are offered in the hospital laboratories for the study of general pathology, clinical pathology, chemical pathology, cardiology, and of treatment by serums and vaccines Surgical operations take place in the main theatres every day except Saturdays at 2 P M Clinical teaching in the wards, out-patients' and special departments, is available every day of the week. Clinical lectures are delivered every Wednesday during the sessions All appointments in the hospital are open to students without extra fee Clinical assistants to all the special departments are appointed every three months A resident assistant physician and a resident assistant surgeon, at a salary of £150 each, are appointed biennially, also four hospital registrars (medical, surgical, obstetric, and ophthalmic), the two former receive a salary of £150 and the two latter £50 An assistant in the clinical laboratory and an assistant pathologist are paid at the rate of £200 per annum. Appointments open to students before qualification Clinical clerks and dressers for in and out-patients are selected from students who have completed their third year's work Every student acts as clerk in the post mortem room and in one of the pathological laboratories, takes his turn on maternity duty under proper supervision in the maternity ward, thus obviating any necessity for seeking instruction elsewhere. Students are instructed in the administration of anæsthetics by one of the hospital anæsthetists The Students' Club comprises a spacious restaurant and smoking and reading room There is no occasion for students to leave the hospital buildings during working hours The curriculum is arranged to meet the requirements of all the Examining Bodies. Special classes are held for the examinations at the Uni versity of London and for the First and Final Fellowship Examinations of the Royal College of Surgeons of England. Tutorial classes in all subjects precede the various exa- minations The hospital is easily accessible from all parts.

Fees —The annual composition fee is 30 guineas, covering all tutorial classes—in addition to a fee on en trance Qualified practitioners are permitted to attend the hospital practice on terms which may be ascertained from the secretary

Staff —Consulting Physicians Dr Harley, Sir Seymour J Sharkey, and Dr Acland Consulting Obstetrical Physician Dr Gervis Consulting Ophthalmic Surgeon Mr Lawford. Consulting Anæsthetist Mr W Tyrrell Consulting Dentist Mr C E Truman Physicians Dr Hawkins, Dr Mackenzie, Dr Turney, Dr Perkins, and Dr Box. Sur geons Sir G H Makins Mr Battle, Mr Ballance, Mr Robinson Mr Cuthbert Wallace, Mr E M Corner, and Mr Percy Sargent Physicians to Out-patients Dr Russell, Dr Buzzard, and Dr Cassidy Surgeons to Out-patients Mr C A R Nitch and Mr J E Adams Obstetric Physicians Dr Fairbairn and Dr Hedley Ophthalmic Surgeons Mr Fisher and Mr Hudson Phy sician for Diseases of Children Dr Box Surgeon for Diseases of Children Mr J E Adams Mental Diseases Dr R Percy Smith Surgeon for Diseases of the Throat

---

[2] Certain of these scholarships and those in connexion with the Cancer Investigation Department have been modified for the period of the war particulars of which can be obtained on application

Mr W G Howarth. Physician for Diseases of the Skin Dr E Stainer Surgeon for Diseases of the Ear Mr Marriage. Dental Surgeon Mr R McKay Resident Assistant Physician Dr G Hoffmann Resident Assistant Surgeon Mr S H Rouquette Anæsthetists Dr H Low, Dr Mennell, Dr Hedley, and Dr Dunkley Pharmaceutist Mr J A. Jennings Curator of Museum Professor S G Shattock. Director of Laboratories Mr L S Dudgeon Chemical Pathologist Dr Hugh Maclean Superintendent of X Ray Department Mr A. D Reid Physico-therapeutic Department Mr R Timberg, Dr J B Mennell, and Mr W R Bristow Tuberculosis Department Dr R C Wingfield. Cardiograph Department Dr M. A. Cassidy

The staff deliver the lectures in their respective subjects, assisted by the following lecturers and demonstrators — Anatomy Professor F G Parsons Chemistry Dr Le Sueur Physiology Dr J Mellanby Biology Dr O Donoghue and Mr W Rushton. Physics Mr Brinkworth Midwifery and Diseases of Women Dr Fairbairn Pharmacology and Therapeutics Dr Woolley Forensic Medicine and Toxicology Dr E Smith and Dr J C Withers Mental Diseases Dr W H. B Stoddart Public Health Dr H P Newsholme. Tropical Medicine Professor Sandwith. Instruction in Vaccination by Dr Cope

Dean of the School Dr E. Stainer Sub-Dean Dr C R Box Secretary Mr G Q Roberts, from whom any further information may be obtained

Scholarships and Prizes —At this school there are five Entrance Scholarships—namely, two in Arts equivalent to the tuition fees for the first medical examination, two in Natural Science of the value of £150 and £60 respectively, to be taken out in tuition fees, and the University Scholarship of £50 in Anatomy, Physiology, and Chemistry The money value and subjects of examination of the remainder are as follows (*a*) and (*b*) two College Prizes, one for second-year students and one for third year students £10 and £5 respectively, (*c*) William Tite Scholarship for second-year students, £25, (*d*) and (*e*) Musgrove Scholarship or (alternately) Peacock Scholarship, each for third-year students and tenable for two years, £35 each, (*f*) three College Prizes for fifth-year students of £10 each and three of £5 each, (*g*) Cheselden Medal, Surgery and Anatomy, (*h*) Mead Medal, Medicine, Pathology, and Hygiene, (*i*) Toller Prize, Medicine, Pathology, and Hygiene, (*j*) Bristowe Medal, Pathology and Morbid Anatomy (*k*) Solly Medal and Prize biennially, Surgical Reports, (*l*) Treasurer s Gold Medal for the most distinguished fifth year student, (*m*) Wainwright Prize, Medicine, Pathology, and Hygiene, (*n*) Hadden Prize, Pathology, (*o*) Beaney Scholarship £50 biennially, Surgery and Surgical Pathology, (*p*) Sutton Sams Prize, biennially, reports of cases in Obstetric Medicine, (*q*) Grainger Testimonial Prize, £31 10*s* Anatomy and Physiology, (*r*) Salters' Company Research Fellowship, tenable for three years, £100 annually, Pharmacology, (*s*) Louis Jenner Research Scholarship, tenable for two years, £60 annually, Pathology, and (*t*) Research Scholarship, tenable for two years, £200 per annum.

UNIVERSITY OF LONDON, UNIVERSITY COLLEGE.—University College has been constituted a University centre for the teaching of medical sciences The College Faculty of Medical Sciences comprises the Departments of Physics Chemistry Botany and Zoology (the Preliminary Medical Sciences), also the Departments of Anatomy, Physiology, and Pharmacology (the Intermediate Medical Sciences), and the Departments of Hygiene and Public Health, and of Pathological Chemistry (Post-graduate Study)

Faculty of Medical Sciences —Composition fees —For the courses required by the University of London. 1 For the First Medical Course, 26 guineas entitling to one attendance and to the privileges of the Union Society for one session 2. For the Second Medical (Intermediate) Course, 58 guineas if paid in one sum, 60 guineas if paid in two instalments of 30 guineas each. This fee entitles to attendance at Anatomy and Physiology during three years and to one attendance at Organic and Applied Chemistry, Pharmacology and Materia Medica, and to the privileges of the Union Society for two sessions

For the medical education required by the Examining Board in England and the Society of Apothecaries First examination Parts I II III, 21 guineas, entitling to attendance for the First and Second Terms and to the privileges of the Union Society for one session, 26 guineas, entitling to attendance throughout the session and to the privileges of the Union Society for one session First Examination, Part IV, and second examination, 58 guineas if paid in one sum, and 60 guineas if paid in two instalments of 30 guineas each This fee entitles to attendance during three years and to the privileges of the Union Society for two sessions

Professors and Lecturers —1. First Medical Course — Chemistry —Professors J N Collie F R.S, and F G Donnan, F R S, assistant professor Samuel Smiles D Sc, teachers of chemistry to medical students R H. Plimmer D Sc, and W B Tuck, D Sc., assistants Irvine Masson, M Sc, R E Slade, D Sc, Katharine A. Burke, D Sc and H Terrey, B Sc, demonstrator W W Reeve, B Sc. Physics —Professor W H Bragg, F R S, reader in thermo-dynamics A. W Porter F R S, assistants N Eumorfopoulos, B Sc, A. O Rankine, D Sc., F L Hopwood, M Sc, and D O Wood, M Sc Botany — Professor F W Oliver, F R S, reader in plant physiology T G Hill, A.R C S, assistant E M Cutting, M A. Zoology —Professor J P Hill, F R S, assistants C H O'Donoghue, D Sc., F J Bridgman, A.R C S, and Katharine M Parker, D Sc 2. Second Medical (Intermediate) Course.—Anatomy —Professor G D Thane, F R S, demonstrator and lecturer in surgical anatomy H T Mant, F R C S, demonstrator, lecturer in physical anthropology, and curator of the museum D E Derry, M B, demonstrator and lecturer in anatomy T B Johnston, M B, assistant demonstrators G V Anderson R B Green and N D Ball. Jodrell Professor of Physiology E H Starling, F R S Professor of General Physiology W M Bayliss, F R S. Readers G A. Buckmaster, M D, and R H Plimmer, D Sc Assistant and Sharpey Scholar C Lovatt Evans, D Sc Pharmacology —Professor A. R Cushny, F R S Assistant J W C Gunn, M B

Scholarships and Prizes —The first three items on the present list require a complete intermediate course at University College. The money value and subjects at examinations are as follows (*a*) The Bucknill Scholarship 135 guineas, (*b*) and (*c*) two Entrance Exhibitions, 55 guineas each, Chemistry, Physics, Botany, and Zoology, (*d*) Cluff Memorial Prize £15 biennially, Anatomy, Physiology, and Chemistry, (*e*) Schäfer Prize in Physiology, £18 triennially, (*f*) Sharpey Physiological Scholarship £105, Biological Sciences, (*g*) Morris Bursary for sons of deceased professional men by nomination, tenable for two years, £16 a year, and (*h*) five Gold and five Silver Medals awarded annually in various departments

Women students are admitted

UNIVERSITY COLLEGE HOSPITAL MEDICAL SCHOOL — Dean Dr G F Blacker Acting Secretary G E Adams Fees for Preliminary and Intermediate Course See under University *College* For the Final M.B, B S (London) Course, 80 guineas if paid in one sum, 82 guineas if paid in two instalments, as follows— first year, 50 guineas, second year, 32 guineas This fee entitles to attendance on Lectures and Hospital Practice during three years and to one attendance on Practical Pathology and Practical Surgery Vaccination and attend ance at a Fever Hospital are not included Students who obtain a medical qualification within three years of the time of commencing this course are not required to pay an additional fee for further attendance This course of instruction is also suitable for the corresponding examinations at the Universities of Oxford, Cambridge, and Durham and for the medical education required by the Examining Board in England and the Society of Apothecaries

There are over 300 beds in the hospital.

Special Departments, Clinical and Laboratory Facilities — Those who are desirous of carrying out original research in Pathology including Morbid Anatomy, Bacteriology, Experimental Pathology, and Chemical Pathology, are admitted to work in the laboratories of the school by the Director of Pathological Studies and Research, and under certain conditions can receive grants from the Charles Graham Medical Research Fund A special course of instruction is given for preparation for the examinations for Diplomas in Public Health of the various universities and examining bodies, also special courses of Lectures and

Demonstrations in Anæsthetics, Diseases of the Eye, Ear, Nose, and Throat, Skin, and Diseases of the Teeth, in Electrical and Radioscopic Diagnosis and Treatment, in Clinical and Tropical Pathology, and in Cardiac Pathology These courses are designed for senior students and graduates

Appointments tenable by Students —Clerkships and dresserships to the physicians, surgeons, anæsthetist, and pathologist are allotted amongst the students of the hospital Maternity students are appointed each month and reside in the Students' House connected with the Medical School and Hospital. Eight house physicians and house surgeons, four senior and four junior obstetric assistants are selected annually by examination from among the senior students who have a medical qualification The house physicians and house surgeons reside free in the hospital for six months, and the senior obstetric assistants for three months In addition to these posts there are certain special appointments which are vacant from time to time and are filled by senior students of the hospital 1. The Resident Medical Officer This officer is appointed for a period of two years and is chosen from amongst the more senior recent residents of the hospital 2 The two Surgical Registrars are also chosen from among the more senior recent residents of the hospital. 3 The Obstetric Registrar 4 Two Casualty Medical Officers and a Casualty Surgical Officer are appointed, each for a period of six months 5 Assistant in Ear and Throat Department, appointed for one year 6 Assistant in Ophthalmic Department, appointed for one year 7 Registrar in Anæsthetic Department, appointed for one year 8 Deputy Anæsthetists During the absence of one or another of the Anæsthetists in the summer months a senior qualified student is appointed as a substitute and is granted a special certificate

Museum of Pathological Anatomy —The Museum, a spacious and well lighted room, is open for study from 9 A M to 5 P M Microscopic sections of most of the specimens in the Museum have been prepared and are available for the use of students on application to the Curator The Museum contains 1100 admirable paintings by Sir Robert Carswell and Sir Charles Bell and a collection of old surgical instruments formerly belonging to Robert Liston

The Anatomical Museum of the University of London, University College, is open to all students of University College Hospital and Medical School on the recommendation of the School Committee

The Medical Library is open daily for the purposes of study to every student of the Medical School from 9 A M to 5 P M, Saturdays 9 A M to 1 P M It contains about 13,500 works on medical subjects including all the current text-books and works of reference required for study or research

The Medical Society of University College Hospital Medical School exists for the dual purpose (1) of promoting the study of Medical and Surgical Science, and (2) of promoting social intercourse among its members All Students of the Medical School are eligible for membership Meetings are held once a fortnight for the purpose of discussing subjects connected with the study of medicine In its social aspect the society includes various athletic clubs and superintends the gymnasium and squash racquet court in the Medical School The Athletic Ground, which is used in conjunction with the Union Society of the University of London University College, is situated near the Great Western Railway station at Perivale

Residence of Students —A register of boarding residences is kept in the office of the Medical School for the convenience of students, these residences are not under the control of the school authorities University College Hall, Ealing, is recognised by the Medical School authorities as a residential hostel The Students' House in University street contains large and comfortable rooms The Maternity Students occupy them on payment of a moderate charge Gentlemen who desire assistance in their studies should consult the Dean or Lecturers

Hospital Staff —Consulting Physicians Dr F T Roberts, Sir John Williams, and Sir Thomas Barlow Physicians Sir John Rose Bradford, F R S, Dr Sidney Martin, F R S, Dr H Batty Shaw, and Dr F J Poynton Assistant Physicians Dr C Bolton, Dr T R Elliott, and Dr T Lewis. Obstetric Physicians Dr H Spencer and Dr G F Blacker Physician to Skin Department Dr A M H. Gray Physician in charge of Mental Diseases Department Dr B Hart. Consulting Surgeons Sir John Tweedy (Ophthalmic), Sir Rickman Godlee, and Mr B Pollard Surgeons Mr Raymond Johnson and Mr Trotter, Assistant Surgeon Mr Gwynne Williams Ophthalmic Surgeons Mr P Flemming and Mr J H Parsons Ear, Nose, and Throat Department Mr Herbert Tilley Assistant Surgeon Mr G S Hett Anæsthetists Dr D W Buxton, Dr H J Shirley, and Dr A. B Kingsford Assistant Anæsthetist Mr F S Rood Dental Surgeons Mr P S Spokes and Mr H J Relph Surgical Registrars Mr E K Martin and Mr C E Shattock. Resident Medical Officer Dr H L Tasker Pathologist Mr T W P Lawrence Bacteriologist Dr F H Teale Assistant Physician in Charge of Cardiographic Department Dr T Lewis Officer in Charge of Electro-Radiographic Department Mr R H Cooper Pharmacist Mr C H Hampshire Other lecturers and demonstrators are Surgical Anatomy Mr H T Mant Diseases of Childhood Dr Dr C Bolton, Mr P Flemming, Mr Gwynne Williams, and Mr H Tilley General Pathology Dr A. E Boycott. Practical Pathology Mr D' Embleton, Mr S H. Warren, and Mr E Bach In the Dental Department in Great Portland street, formerly known as the National Dental Hospital, there is afforded the opportunity for attending lectures and practical instruction in diseases of the mouth and teeth

Scholarships and Prizes —At this School the first two Scholarships (*a*) and (*b*) require a complete course at University College and University College Hospital Medical School, the second two (*c*) and (*d*) require a final course at the Medical School The money value and subjects of examination are as follows —(*a*) Entrance Scholarship, Bucknill, 135 guineas, Chemistry, Physics, Botany, and Zoology, (*b*) Epsom Free Medical Scholarship, subjects of Preliminary Scientific Examination and Nomination by Epsom College, (*c*) and (*d*) two Goldsmid Entrance Exhibitions, 80 guineas each, Anatomy and Physiology, (*e*) Graham Scholarship in Pathology, £200 per annum for two years, awarded by the Senate of the University of London, (*f*) Atkinson Morley Scholarship, tenable for three years, £45 per annum, Surgery, (*g*) Atchison Scholarship, tenable for two years, £55 per annum, General Proficiency in Medical Studies (*h*) Magrath Clinical Scholarship, about £100, Clinical Cases, (*i*) Percival Alleyn Scholarship, about £60, Surgery, (*j*) Filliter Exhibition, £30, Pathology, (*k*) Erichsen Prize, £10 10*s*, Practical Surgery, (*l*) two Senior and two Junior Fellowes Clinical Medals for Clinical Medicine, (*m*) two Liston Gold Medals for Clinical Surgery, (*n*) Alexander Bruce Gold Medal for Pathology and Surgery, and (*o*) Tuke Silver and Bronze Medals for Pathology (*p*) Radcliffe Crocker Travelling Scholarship for Dermatology

---

WESTMINSTER HOSPITAL —The hospital contains 215 beds and affords relief to upwards of 2000 in patients and 30,000 out-patients annually There are separate departments for Diseases of the Eye, Ear, Skin, Teeth, and Throat, for Orthopædic practice, for Diseases of Women, for Diseases of Children, for Radiography, and for the Light Treatment. The Anatomical, Pathological, and Materia Medica Museums are open to all students of the school

A medical and surgical registrar, each with a salary of £50, are appointed annually Two house physicians, three house surgeons, and a resident obstetric assistant are appointed for six months after examination, and are provided with rooms and commons, also one assistant house physician and one assistant house surgeon with commons only Clinical assistants to the assistant physicians and assistant surgeons, and to the officers in charge of special departments, are appointed from among qualified students of the hospital

By a scheme for the concentration of the teaching of the preliminary and intermediate subjects of the curriculum, which has the support of the London University, an arrangement has been made by the Westminster School for the teaching of these subjects at King's College. Students, however, join the Westminster Medical School as formerly and may compete for Entrance Scholarships as heretofore

There is laboratory accommodation for practical work in Chemistry, Physics, Biology, Anatomy, Physiology, Histology, Pathology, and Bacteriology, and a new Clinical

Laboratory has recently been erected. Facilities for research are afforded in all the laboratories

For membership of the Clubs Union students are not required to pay, the expense being covered by the entrance fee to the school

Staff—Consulting Medical Staff Sir Bryan Donkin, Dr de Havilland Hall, and Dr Hebb (lecturer on general pathology with Dr Braxton Hicks) Consulting Surgical Staff Mr Richard Davy, Mr G Cowell, and Mr N C Macnamara. Medical In patient Staff Dr A M Gossage, Dr Purves Stewart, and Dr Carmalt Jones Obstetric Physician Dr G H. Drummond Robinson Surgical In patient Staff Mr W G Spencer, Mr A H Tubby, and Mr William Turner Medical Out-patient Staff Dr D H de Souza, Dr Kinnier Wilson, and Dr O K. Williamson. Physician for Diseases of the Skin Dr S E Dore Assistant Obstetric Physician Dr S Dodd. Medical Officer in Charge of Electrical Department Mr E S Worrall Surgical Out-patient Staff Mr Arthur Evans and Mr Rock Carling Surgeon in charge of the Throat Department Mr P R W De Santi Ophthalmic Surgeon Mr G T B James Surgeon in charge of the Orthopædic Department (Vacant) Surgeon-in-charge of the Ear Department Mr P R W De Santi. Dental Surgeons Mr C W Glassington and Mr E Gardner Administrators of Anæsthetics Dr N W *Bourns*, Dr V B Orr and Mr E W Gandy Physician Pathologist Dr R G Hebb Assistant Pathologist and Curator of Museum Dr J A Braxton Hicks Resident Medical Officer Dr H J Johnson Medical Registrar (Vacant) Acting Surgical Registrar (Vacant) Pharmacist Mr A. E Tanner Secretary Mr S M Quennell

The staff deliver the lectures and give demonstrations in their respective subjects Other lecturers and demonstrators are —Medicine Lieutenant-Colonel Pratt Elementary Practical Medicine Mr Worrall. Insanity Dr Hubert J Norman. Surgery Mr W Turner Materia Medica, Therapeutics, and Pharmacology Dr Dixon Forensic Medicine Dr Burnford Toxicology Dr H. Wilson Hake Public Health Dr S Monckton Copeman Bacteriology Dr Burnford Anatomy (Professor) Dr Barclay Smith, (Lecturer) Dr R J Gladstone Demonstrators of Practical Anatomy Mr Boyd and Mr Fenwick. Physiology and Practical Physiology and Histology Dr Halliburton, Dr Locke, and Dr Rosenheim. Biology Dr Bottomley and Mr Schwartz Chemistry and Practical Chemistry Dr Crossley Dr Jackson, Mr Kirkaldy, Mr Collins, and Mr Hinkel Physics Dr Richardson, Dr Allen, Dr H Moore, and Mr Martyn Secretary and Librarian Dr E B Hulbert

Scholarships and Prizes —The following Entrance Scholarships are offered for competition Winter Session (*a*) Arts Scholarship the "Guthrie," £60 (*b*) Science Scholarships Natural Science Scholarship, £60, Chemistry and Physics Scholarship £30, and Two Scholarships in Anatomy and Physiology, £50 each. Summer Session Two Scholarships in Anatomy and Physiology, £50 each During the period of study the following prizes may be competed for Sturges Prize in Clinical Medicine, about £6, Notes of Cases, Clinical Surgery Prize, £5, Notes of Cases, Chadwick Prize £21 in books or instruments, Medicine and Surgery, including Pathology and Applied Anatomy and Physiology, Frederic Bird Medal and Prize open to Fourth year Students, £14 in medal and books or instruments—Midwifery, Diseases of Women Medicine, Pathology, Forensic Medicine and Bacteriology and Public Health and Toxicology, Abrahams Prize in Clinical Pathology, 5 guineas, a Paper and Tests in Practical Work, Alfred Hughes Memorial Prize, open to Second year Students, about £5 in books or instruments—Anatomy, Huxley Memorial Prize, 3 guineas in books or cash, open to Second year Students—Physiology, Carter Gold Medal and Prize for Botany, open to Students of not more than three years attendance, gold medal and books of the joint value of £15, Jelf Medal awarded to Third year Students, Second year Scholarship, £20 Elementary Anatomy, Physiology, Histology, and Organic Chemistry, Daniell Scholarship, tenable for two years £20 Chemistry, Rabbeth Scholarship open to First-year Students £20, Class Examinations in the Preliminary Scientific Course, and the Sambrooke King s College Scholarship in Science value £25

LONDON (ROYAL FREE HOSPITAL) SCHOOL OF MEDICINE FOR WOMEN, 8, Hunter street, Brunswick square, W C —The fee for the medical course for the degrees of the University of London and for the diplomas of the Royal Colleges of England and for other qualifications is £169 in one sum, or £179 in five instalments These sums include library and laboratory fees

The Royal Free Hospital contains 184 beds, of which 78 are reserved for surgical, 64 for medical, 13 for gynæcological, six for ophthalmic, 11 for maternity, and four for isolation cases A new block has recently been completed containing large and completely equipped departments for Outpatients, Massage, Dental, X Ray, and Electrical Work, Maternity (interne 11 beds, and externe), and Casualty New and enlarged students' quarters are also provided Students can also attend the in patient and out-patient practice of the New Hospital for Women

An agreement has also been made under which students of the school attend full clinical courses at St Mary's Hospital, Paddington (305 beds)

Special courses are arranged for the Primary Fellowship Examination of the College of Surgeons, also for dental students in conjunction with the London Dental Hospital, Leicester square, and the National Dental Hospital.

Students after qualification can hold the posts of house physician, house surgeon, obstetric assistants, clinical assistants, anæsthetists and assistant anæsthetist, medical and surgical registrars, pathologists, medical electrician, and museum curator, and at the Medical School the posts of demonstrators in the departments of Anatomy, Physiology, Chemistry, and Physics They can also hold posts at the New Hospital for Women, South London Hospital for Women and Children, and at four other hospitals in London entirely officered by medical women Many other resident posts in London and elsewhere are also open to them

The School buildings have been entirely rebuilt in recent years, and there are spacious, well equipped laboratories, which afford every facility for efficiency of teaching and practical work in all departments An extension of the School was opened in 1916 The extension will enable 90–100 new students to be received at the School each year

There are residential chambers at 8, Hunter street, and 36, Tavistock square, and the Warden can be consulted on the subject of other residences for students The Students' Union arranges the social, athletic, and other clubs and societies at the School

Staff—Consulting Physicians Dr S West and Dr Sainsbury Physicians Dr J W Carr, Dr A. G Phear, and Dr W P S Branson. Assistant Physicians Dr Saunders, and Dr Firth Consulting Surgeon Mr A B Barrow Surgeons Mr J Berry, Mr W H Evans, and Mr Cunning Consulting Neurologist Dr Farquhar Buzzard Consulting Physician for Diseases of Women Dr Mary Scharlieb Physicians for Diseases of Women Dr Ethel Vaughan-Sawyer and Dr Florence Barrett Surgeon for Diseases of Throat, Nose, and Ear Mr J Gay French Surgeon for Diseases of the Eye Mr M L Hepburn Assistant Surgeons Mr C Pannett and Mr C A Joll Surgeon for Diseases of Skin Mr W H Evans Dental Surgeons Dr Harwood, L D S, and Mr E P Hudson, L D S Pathologist Dr Mary Schofield Registrars Dr Cuthbert and Dr Dearnley Anæsthetists Dr May Dickinson Berry, Dr Jane Turnbull, Dr Vivian Orr, and Dr Anna Gilliatt Secretary Mr Reginald Garratt

Lecturers —At the School Anatomy and Practical Anatomy Professor F Wood Jones Physiology and Practical Physiology Dr Winifred Cullis Chemistry Mr J A Gardner, M A., F I C, and Miss Widdows, B Sc Physics Miss M Waller, B Sc Biology Mr Mudge, A R C S Pharmacology Dr F Ransom Practice of Medicine Dr J W Carr and Dr Emily Flemming Midwifery Dr Florence Barrett Gynæcology Dr Ethel Vaughan Sawyer Forensic Medicine Dr Hawthorne Toxicology Dr Wilson Hake Practice of Surgery Miss Aldrich Blake and Mr W H. Evans Operative Surgery Mr Joll Pathology Dr W d'Este Emery Mental Pathology Dr J G Porter Phillips Tropical Diseases Dr C W Daniels Operative Midwifery Dr Florence Barrett. Demonstrators of Anatomy, Dr Mary Keene and Dr Joyce Partridge, of Physiology, Mrs Tribe, B Sc Miss Bond, B Sc, Miss Hewen, M Sc, Miss Wiltshire, B Sc, of Chemistry, Miss Williams B Sc., Mrs. Taylor, Miss Mackenzie, B Sc., of Physics, Miss Griffiths, B Sc, Miss

Alcock, B Sc , Miss Leyshon, B Sc , of Practical Pharmacy, Miss Buchanan, M P S

Dean of the School, Miss Aldrich Blake, M D , M S , Honorary Secretary, Dr May Thorne , Warden and Secretary, Miss L M Brooks

Scholarships and Prizes—(*a*) Isabel Thorne Scholarship, £30 (*b*) St Dunstan's Medical Exhibition, £60 a year tenable for three or five years (*c*) Mrs George M Smith Scholarship, £50 a year tenable for three or five years and next to be awarded in 1919 (*d*) Bostock Scholarship, tenable for two or four years, and next to be awarded in June, 1919, £60 (*e*) Mabel Sharman Crawford Scholarship, tenable for four years, £20 a year (*f*) Mabel Webb Research Scholarship, tenable for one year and renewable, £30, *Physiology, Chemistry or Pathology* (*g*) Fanny Butler Scholarship, tenable for four years , next award in July, 1918, £14 10*s* (*h*) John Byron Bursary, tenable *from two to four years, for students already in the School* requiring assistance for the prosecution of their medical studies, application to the Secretary by March 31st , next award in March, 1919, £20 (*i*) Ellen Walker *Bursary tenable* for two years, awarded to a student beginning fourth year of medical study, £25 a year (*k*) Helen Prideaux Scholarship, awarded every second year to a student who has become qualified during the two years immediately preceding the award, and to be spent in assisting the holder to further study, £40 (*l*) Agnes Guthrie Bursary, value £60 is offered annually to students who desire to pursue a full course of study for the Licentiateship in Dental Surgery (*m*) Dr Edith Pechey Phipson Post-graduate Scholarship of the value of £40, awarded annually in June It is open to all medical women, preferably coming from India, or going to work in India, for assistance in Post-graduate study (*n*) Sarah Holborn Scholarship, value £20 a year for three or five years, awarded every alternate year , next award in 1919 Two Richardson Kuhlmann Prizes are given each year, value £12 for proficiency in Clinical Obstetrics, value £8, for proficiency in senior subjects respectively Two Evans Prizes of £2 2*s* and £1 1*s* are given each year on the results of the class examination in Midwifery The Evans Prize for Operative Midwifery, value £5 5*s* , is awarded yearly The Edith Pechey Phipson Prize in Pharmacology, value £3 3*s* , is awarded annually There is also a small loan fund from which assistance can occasionally be given to students and to graduates who specially require pecuniary help Prizes and Certificates of Honour are awarded in each class at the end of the session

---

UNIVERSITY OF DURHAM

Two Diplomas, one Licence, and six degrees are conferred —viz , the Diploma in Public Health, Diploma in Psychiatry, the Licence in Dental Surgery and the degrees of Bachelor of Medicine, Bachelor of Surgery, Master of Surgery, Doctor of Medicine, Bachelor of Hygiene, and Doctor of Hygiene

For the degree of *Bachelor of Medicine* there are four professional examinations The subjects of the First Examination are—*Elementary Anatomy* Elementary Biology, Chemistry, and Physics The subjects of the Second Examination are—Anatomy and Physiology The subjects for the *Third Examination* are—Materia Medica and Pharmacy, Pathology Medical Jurisprudence, Public Health, and Pathology and Elementary Bacteriology The subjects of the Fourth Examination are—Medicine Clinical Medicine and Psychological Medicine, Surgery and Clinical Surgery Midwifery and Gynæcology, Therapeutics, and Diseases of the Skin, of the Throat, Nose, and Ear, and of Children

It is required that at least one of the five years of professional education shall be spent in attendance at the University College of Medicine Newcastle upon Tyne Candidates who have passed the First and Second Examinations of the University will be exempt from First and Second Examinations of the Conjoint Board

For the degree of *Bachelor of Surgery* every candidate must have passed the examination for the degree of Bachelor of Medicine of the *University of Durham* and must have attended one course of lectures on Operative Surgery and one course on Applied Anatomy Candidates will be required to perform *operations* on the dead body and to give proof of practical knowledge of the use of surgical instruments and appliances

For the degrees of *Doctor of Medicine* and *Master of Surgery* a candidate must not be less than 24 years of age and must satisfy the University as to knowledge of Greek or German If he has not already satisfied the Matriculation Examiners in either Greek or German he must pass in one of these subjects at one of the ordinary matriculation examinations of the Newcastle division of the University He must also have obtained the degree of Bachelor of Surgery of the University of Durham and must have been engaged for at least two years subsequently to the date of acquirement of the degree of Bachelor of Surgery, in attendance on the practice of a recognised hospital, or in the naval or military services, or in medical or surgical practice The candidate for the M D degree must present an essay The subjects of examination for the M S are —Principles and Practice of Surgery, Surgical Pathology, Surgical Anatomy, Surgical Operations Clinical Surgery

Doctor of Medicine (without residence)—The University of Durham has instituted a special examination whereby *the degree* of Doctor of *Medicine may* be obtained without residence Candidates shall not be under 40 years of age and shall have been in active practice for *15 years as registered medical practitioners* They shall produce certificates of moral character from three registered members of the medical profession The fee will be *50 guineas, of which 20 guineas* will be retained if the candidate fails to satisfy the examiners

Candidates for any of the above degrees, diplomas or licence, must give at *least* 28 days' notice to Professor Howden, Secretary, College of Medicine, Newcastle-upon-Tyne In the case of the M D (essay) examination candidates must send in their essays six weeks before the date of the examination

Professors—Principles and Practice of Medicine Sir G H Philipson M D , Dr David Drummond, and Sir T Oliver, M D Psychological Medicine Dr T W McDowall Surgery Mr James Rutherford Morison, Mr Henry Brunton Angus, and Mr G Grey Turner Ophthalmology Mr John Dobson Wardale Midwifery and Diseases of Women and Children Professor R P Ranken Lyle Pathology Professor Stuart McDonald Medical Jurisprudence Professor Robert A. Bolam Public Health Professor Thomas Eustace Hill Therapeutics Professor Thomas Beattie Anatomy Professor Robert Howden , demonstrators, Dr James Dunlop Lickley and Mr E P *Stibbe* Applied Anatomy Mr John Clay Physiology Professor James Acworth Menzies Lecturer Mildred Atkinson Materia Medica and *Pharmacology Professor* W E Hume Comparative Pathology and Bacteriology Professor H J Hutchens , lecturer, Dr F H A. Clayton , demonstrator (*vacant*) , *assistant demonstrator*, Dr George Hall

Scholarships and Prizes—In connexion with this University the following Scholarships and prizes are awarded —(*a*), (*b*), (*c*), and (*d*) Four Scholarships of £25 a year each, tenable for four years , the examination will be the September Matriculation Examination Candidates must take English, Latin, Arithmetic, Euclid, Algebra, Geography, English History, with Greek or German, or both (See College Calendar for special books) Open to candidates desirous of being admitted as Medical Students The successful candidates must take *out* their entire curriculum at the University of Durham College of Medicine, Newcastle upon Tyne (*e*) Pears Scholarship of £50 a year (when vacant), tenable for three years , Matriculation Examination.—At the College of Medicine are (*f*) Dickinson Scholarship interest on £400 and gold medal , examination in Medicine, Surgery Midwifery, and Pathology Open to full students of the College of Medicine who have passed the third M.B Examination (*g*) Tulloch Scholarship, interest on £400 , examination in Elementary Anatomy Biology, Chemistry and Physics (*h*) Charlton Memorial Scholarship, interest on £700 , examination in Medicine. Open to full *students* of the College entered for the class on the Principles and Practice of Medicine (*i*) Gibb Scholarship, interest on £500 , awarded annually *as* a Scholarship in Pathology to full student who passes the best examination in that subject No student is eligible *after completion* of his curriculum (*j*) Luke Armstrong Memorial Scholarship, interest on £680 Original Essay *on some* subject in Comparative Pathology (If no essay *of sufficient* merit be presented the scholarship may be awarded to the candidate who in passing the first part of the Examination for the B Hy Degree, obtains the highest number of marks in Comparative Pathology during the year) Open to all Graduates in Medicine or Hygiene and candidates for these degrees who have spent six months at the University and whose age does not exceed 30 years (*k*) Stephen Scott Scholarship interest on £1000, Original Essay on any Surgical subject Open to any graduate in Medicine or Surgery of the University or any student of the College of Medicine Student s age must not exceed 30 years (*l*) Heath Scholarship, interest on £4000 For 1916 Original Essay on Genito-urinary Tuberculosis Its Etiology, Pathology, Methods of Spread, Prognosis, and Treatment. All Graduates in Medicine or Surgery of the University are eligible. (*m*) Gibson Prize, interest on £250 stock, examination in subject of Midwifery and Diseases of Women and Children. Open to students who have attended one course of lectures on Midwifery and Gynæcology (*n*) Outterson Wood Prize, interest on £250, in Psychological Medicine. (*o*) Turnbull Prize and Medal, examination in Surface Anatomy Open to students at end of their second winter session.—At the Royal Infirmary is (*p*) Goyder Memorial Scholarship, interest on £325, awarded annually to student who most distinguishes himself in Clinical Medicine and Clinical Surgery at the Royal Infirmary For further information apply to Professor Howden Secretary of the College.

Hygiene.—The regulations with regard to the degrees in Sanitary Science will be found under the section on Public Health.

THE COLLEGE OF MEDICINE, Newcastle-upon Tyne.—Clinical instruction is given at the Royal Victoria Infirmary, containing 575 beds In it adequate accommodation is provided for the study of the various special subjects, in addition to the ordinary clinical work.

NEWCASTLE-UPON TYNE ROYAL VICTORIA INFIRMARY.—The Infirmary was founded in 1751, but has been entirely rebuilt the new hospital being opened by His late Majesty King Edward VII in 1906 The number of beds is 575 The number of in patients annually is 9200 and of out-patients 69 000 The medical students of the University of Durham attend the practice of this hospital. Clinical Lectures are delivered by the Physicians and Surgeons weekly and ward demonstrations are given daily Tutorial classes are held by the Assistant Physicians Assistant Surgeons and Surgical Registrars weekly, and demonstrations are given in the several out-patient departments daily Pathological demonstrations are given by the Pathologist daily or as opportunity occurs, and in the new buildings nothing has been spared in perfecting scientific equipment In addition to medical and surgical in patient and out-patient departments the following special departments are fully equipped for teaching students Ophthalmic, Throat, Nose, and Ear Skin, Gynæcological and Electrical The hospital building contains the following laboratories 1. Special Pathological Laboratory, attached to the post-mortem rooms 2. Bacteriological Laboratory, in which all clinical bacteriological investigations are carried out—opsonic indices estimated with a view to treatment by vaccines and serums &c 3 There is in addition a Clinical Laboratory attached to each ward and to the out-patient department There are five operating theatres in use in the hospital The surgical practice is especially good The session opens on April 17th and Oct 2nd of each year Applications for detailed information should be made to the Acting Dean Dr D Wells Patterson, at the hospital

Staff.—Physicians Dr T Beattie Dr W E Hume Dr Horsley Drummond and Dr Alfred Parkin Assistant Physicians Dr George Hall Dr T M Allison, Dr D W Patterson and Dr T C Hunter Surgeons Mr A M Martin Mr H B Angus Mr W G Richardson and Mr J W Leech Assistant Surgeons Mr John Clay, Mr G G Turner and Mr R J Willan Ophthalmic Surgeon Mr J D Wardale Assistant Surgeon Mr T Gowans Throat and Ear Department Surgeon Mr S S Whillis Assistant Surgeon Mr W F Wilson. Gynæcological Department Dr R P R Lyle Skin Department Physician Dr Robert A Bolam Electrical Department Dr W D Arnison Pathologist Dr Stuart McDonald Bacteriologist Dr H J Slade Anæsthetists Dr F G Armstrong, Dr W J Phillips, Dr H H Markham, and Dr W Seymour Medical Registrars Miss H Gurney, Dr J Leslie Wilson, and Dr Glen Davison Surgical Registrars Mr F C Pybus, Mr Hamilton Drummond, Mr Hodgson and Mr Saint

There are other institutions at which the student of medicine of the University of Durham can receive clinical instruction Practical Midwifery can be studied at the Newcastle Lying in Hospital Instruction is given in Psychological Medicine at the Northumberland County Asylum, Morpeth, by Professor T W McDowall, the Superintendent A special course of instruction is given in the City Hospital for Infectious Diseases by the Superintendent, the City Officer of Health, Dr Harold Kerr

NORTHUMBERLAND, DURHAM, AND NEWCASTLE INFIRMARY FOR DISEASES OF THE EYE, St Mary s place, Newcastle-on Tyne.—Consulting Surgeon Dr F Page Staff Surgeons Mr A. S Percival and Mr H P Bennett Matron Miss C E Balfour Secretary Mr Richard Smith, 61, Westgate road, Newcastle-on Tyne Out-patients, 13,000, in patients, 490

UNIVERSITY OF BIRMINGHAM

The University of Birmingham grants the degrees of M B, Ch.B, M D, Ch M, and also a degree and a diploma in Public Health. The course for the Bachelors' degrees extends over five years from the date of commencement of professional study As a rule the first four of these years must be spent in the University, but the Senate has power of recognising attendance at another University as part of the attendance qualifying for these degrees and of recognising examinations passed at such other Universities as exempting from the examinations in Chemistry Physics, and Elementary Biology In the case of such students at least three years must be spent in attendance upon classes at the University The fifth year may be spent at any other school or schools of medicine recognised by the University The students of the Medical Faculty can be members of the University Club the University Athletic Club, and the University Officers' Training Corps, while they possess a guild—the Guild of Undergraduates—which is designed to be a recognised medium of communication between the teachers and the taught The University Medical Society and the Dental Students' Society also offer opportunities of coöperation for mutual benefit

Degrees of Bachelor of Medicine and Bachelor of Surgery.—The student must have passed either the Matriculation Examination of the University or one of the following examinations (see note below) Up to Oct 31st, 1917 the University will recognise any one of the following examinations, in lieu of its own Matriculation in the case of medical students, provided always that such examination shall have included the subjects of Chemistry or Experimental Mechanics or some other branch of Experimental Physics, English, Mathematics, a foreign Language, and *either* another language *or* an additional science, and that all the subjects have been passed at one examination (*a*) the previous examination of the University of Cambridge, (*b*) Responsions of the University of Oxford, (*c*) the Preliminary or Matriculation Examination of a recognised University, (*d*) the (Higher) Certificate of the Oxford and Cambridge Examinations Board, (*e*) the Oxford or Cambridge Senior Local Examination, (*f*) the Senior Certificate of the Central Welsh Board A Matriculation Examination will commence on Sept 12th 1917 (*Note*.—After Oct 31st 1917, all communications respecting the Matriculation Examination and examinations accepted in lieu thereof must be *sent to the* Secretary to the Board Joint Matriculation Board, 24 Dover street Manchester) First Examination.—Chemistry and Physics and Elementary Biology Second Examination.—Anatomy and Physiology Third Examination.—General Pathology and Bacteriology, Materia Medica, and Practical Pharmacy Fourth Examination (at the end of the fourth year).—Forensic Medicine, Toxicology Public Health Therapeutics, and Special Pathology Two years' hospital work must have been accomplished Final Examination.—Medicine Surgery Midwifery Diseases of Women Mental Diseases and Ophthalmology Attendance at a general hospital for a year after the passing of the fourth examination will be required also attendance at a fever hospital three months, maternity hospital

Alcock, B Sc , Miss Leyshon, B Sc , of Practical Pharmacy, Miss Buchanan, M P S

Dean of the School, Miss Aldrich Blake, M D , M S , Honorary Secretary, Dr May Thorne , Warden and Secretary, Miss L M Brooks

Scholarships and Prizes —(*a*) Isabel Thorne Scholarship, £30 (*b*) St Dunstan's Medical Exhibition, £60 a year tenable for three or five years (*c*) Mrs George M Smith Scholarship, £50 a year tenable for three or five years and next to be awarded in 1919 (*d*) Bostock Scholarship, tenable for two or four years, and next to be awarded in June, 1919 £60 (*e*) Mabel Sharman Crawford Scholarship, tenable for four years, £20 a year (*f*) Mabel Webb Research Scholarship, tenable for one year and renewable, £30, Physiology, Chemistry, or Pathology (*g*) Fanny Butler Scholarship, tenable for four years , next award in July, 1918, £14 10*s* (*h*) John Byron Bursary, tenable from two to four years, for students already in the School requiring assistance for the prosecution of their medical studies, application to the Secretary by March 31st , next award in March, 1919, £20 (*i*) Ellen Walker Bursary tenable for two years, awarded to a student beginning fourth year of medical study, £25 a year (*k*) Helen Prideaux Scholarship, awarded every second year to a student who has become qualified during the two years immediately preceding the award, and to be spent in assisting the holder to further study, £40 (*l*) Agnes Guthrie Bursary, value £60, is offered annually to students who desire to pursue a full course of study for the Licentiateship in Dental Surgery (*m*) Dr Edith Pechey Phipson Post-graduate Scholarship of the value of £40, awarded annually in June It is open to all medical women, preferably coming from India, or going to work in India, for assistance in Post-graduate study (*n*) Sarah Holborn Scholarship, value £20 a year for three or five years, awarded every alternate year , next award in 1919 Two Richardson Kuhlmann Prizes are given each year, value £12 for proficiency in Clinical Obstetrics, value £8, for proficiency in senior subjects respectively Two Evans Prizes of £2 2*s* and £1 1*s* are given each year on the results of the class examination in Midwifery The Evans Prize for Operative Midwifery, value £5 5*s* , is awarded yearly The Edith Pechey Phipson Prize in Pharmacology, value £3 3*s* , is awarded annually There is also a small loan fund from which assistance can occasionally be given to students and to graduates who specially require pecuniary help Prizes and Certificates of Honour are awarded in each class at the end of the session

W Assinder This hospital possesses 108 beds and there is an average daily attendance of out-patients of over 250 This institution is recognised by Universities and the Royal College of Surgeons, England, and Royal College of Physicians, London, as an ophthalmic hospital at which clinical instruction in ophthalmology may be received. Students attending for a period of three months will be granted certificates which will qualify for the University and Conjoint Board examinations

---

UNIVERSITY OF LIVERPOOL

The degrees in the Faculty of Medicine are Bachelor of Medicine and Bachelor of Surgery (M B and Ch.B), Doctor of Medicine (M D) Master of Surgery (Ch.M), and Master of Hygiene (M H.)

Degrees of Bachelor of Medicine and Bachelor of Surgery —Candidates for the degrees of Bachelor of Medicine and of Surgery must have attained the age of 21 years on the day of graduation. At least two of the five years of medical study must have been passed in the University, and one year at least must have been passed in the University subsequently to the date of passing the First Examination. The other three years may be passed at any college or medical school recognised for this purpose by the University Candidates must pass three examinations entitled respectively the First Examination the Second Examination, and the Final Examination. The fee is £5 for each examination. The subjects of the First Examination are (1) Chemistry Inorganic, Organic, and Physical , (2) Biology (Zoology and Botany), and (3) Physics. The examination is divided into two parts—namely, (1) Chemistry and Physics, and (2) Biology, and candidates may present themselves in these parts separately The subjects of the Second Examination are (*a*) Anatomy and Physiology (including Physiological Chemistry and Histology), and (*b*) Materia Medica, Pharmacy, and Pharmacology Candidates may present themselves in (*a*) or (*b*) separately The subjects for the Final Examination are (1) General Pathology and Morbid Anatomy , (2) Therapeutics , (3) Forensic Medicine and Toxicology , (4) Public Health , (5) Obstetrics and Diseases of Women , (6) Surgery Systematic, Clinical Operative, and Practical, including Ophthalmology , and (7) Medicine, Systematic and Clinical, including Mental Diseases and Diseases of Children. The Final Examination is divided into three parts, the first consisting of subject (1) the second of subjects (2) (3), and (4), the third of subjects (5) (6) and (7) Candidates may present themselves in these parts separately Candidates for the third part must have completed the fifth year of medical study

Degrees of Doctor of Medicine and Master of Surgery —No candidate will be admitted to the degree of Doctor of Medicine or Master of Surgery unless he has previously received the Degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since he passed the examinations for those degrees Candidates for the degree of Doctor of Medicine are required to present a dissertation embodying the results of personal observations or original research either in some department of medicine or of some science directly relative to medicine provided always that original work published in scientific journals or separately shall be admissible in lieu of, or in addition to, a dissertation specially written for the degree

Professors—Inorganic Chemistry E C C Baly, F R S Physical Chemistry W C. McC Lewis, M.A., D Sc Organic Chemistry R Robinson, D Sc Physiology J S Macdonald, B.A. Physics L. R Wilberforce, M A. Natural History W A. Herdman, D Sc , F R S Botany R J H. Gibson, M A. Anatomy A. Melville Paterson, M D Medicine T Robinson Glynn, M.D Surgery Rushton Parker, F R C.S Regional Surgery W Thelwall Thomas, Ch.M., F R.C.S Pathology Ernest Glynn, M D Midwifery and Gynæcology H Briggs, M D Therapeutics J H. Abram, M.D Hygiene E. W Hope, D Sc. Forensic Medicine R. J M Buchanan, M D Tropical Medicine J W W Stephens, M D Tropical Sanitation Major Sir Ronald Ross, F R.S Bio Chemistry W Ramsden, D M. Entomology R. Newstead, M Sc., A.L S F R.S Bacteriology J M Beattie, M A., M D Parasitology Warrington Yorke M.D

At this University the following Scholarships and Fellowships and Prizes are awarded —(*a*) and (*b*) Robert Gee Entrance Scholarships, two annually, of £25 each, tenable for two years, Joint Matriculation Board Examination held in July, open to First M B Course Students , (*c*) Lyon Jones Scholarship, No 1 of £21 per annum, tenable for two years, Competitive Examination among Junior Students in First M B Subjects, Perpetual Course at the University , (*d*) Lyon Jones Scholarship, No 2 of £21, Competitive Examination among Senior Students in Anatomy, Physiology, Pharmacology, and Materia Medica , (*e*) Derby Exhibition of £15, Competitive Examination among Fourth- or Fifth year Students in Clinical Subjects, and Clinical School Exhibition of £15 annually for Fourth- or Fifth-year students , (*f*) University Scholarship of £25 for one year, awarded on results of Second Examination for the degrees , (*g*) Holt Fellowships Physiology and Pathology of £100 each, for one year , (*h*) Gee Fellowship, Anatomy, of £100, for one year , (*i*) Alexander Fellowship, Bacteriology and Pathology, of £100, for one year , (*j*) Johnston Colonial Fellowship, Bio-Chemistry, of £100 for one year , (*k*) John W Garrett International Fellowship, Bacteriology, of £100, for one year , (*l*) Thelwall Thomas Fellowship Surgical Pathology, of £100, for one year , (*m*) Ethel Boyce Fellowship in Gynæcological Pathology, of £100, for one year , numerous prizes and medals

Medical School Buildings —Medical research has also been endowed with several new laboratories in which students can pursue research work after graduation. All the laboratories and class-rooms are situated close together, communicating with one another and are made up of four large blocks of buildings which form one side of the College quadrangle. There are the Johnston Laboratories for Experimental Medicine, Bio-Chemistry, and Tropical Medicine , the Medical School for Anatomy Surgery, Toxicology, and Ophthalmology , and the Thompson-Yates Laboratories for Physiology and Pathology

Clinical Instruction —The Clinical School of the University now consists of four general hospitals—the Royal Infirmary, the David Lewis Northern Hospital, the Royal Southern Hospital, and the Stanley Hospital , and of five special hospitals —the Eye and Ear Infirmary, the Hospital for Women the Infirmary for Children, St Paul s Eye Hospital, and St. George s Hospital for Skin Diseases These hospitals contain in all a total of about 1134 beds. The organisation of these hospitals to form one teaching institution provides the medical student and the medical practitioner with a field for clinical education and study which is unrivalled in extent in the United Kingdom All the hospitals are within easy access of the University There are a large number of appointments to house physicianships and surgeonships both at the general and special hospitals which are open to qualified students of the school.

School of Veterinary Science —There is a school of Veterinary Science in connexion with the University which provides full courses of instruction for the M R C V S Degrees of B V Sc., M V Sc., and D V Sc , together with a diploma in Veterinary Hygiene, are also granted by the University

Public Health Department —This is located in a separate building known as Ashton Hall, in which full courses of instruction are given to students for the Diplomas and Degrees of the University and of other Examining Boards one month, and lunatic asylum three months Vaccination instruction must be taken out and courses of Ophthalmology, Medical and Surgical Anatomy, and Operative Surgery

Degrees of Doctor of Medicine and Master of Surgery —At the end of one year from the date of having passed the final M B , Ch B examination the candidate will be eligible to present himself for the higher degrees of either Doctor of Medicine or Master of Surgery or both

Candidates for either of these degrees have to present a thesis embodying observations in some subject embraced in one of the departments of the medical curriculum, and in addition pass a general examination in Principles and Practice of Medicine for the M D , and general examination in Principles and Practice of Surgery, including operations on the cadaver for the M Ch It will be in the power of the Board of Examiners to exempt from the practical parts of the examination a candidate whose thesis is of exceptional merit from any part of these examinations

Fees —Matriculation, £2 , First Examination, £2 , Second Examination, £2 , Third Examination, £2 , Fourth Examination £2 , Final Examination, £8 , M D or Ch M , £10

Professors—Physics Acting Professor G A Shakespeare, M A , D Sc Chemistry P F Frankland, Ph D , F R.S Elementary Biology F W Gamble, D Sc , F R S Medicine Otto J Kauffmann, M D , and J W Russell, M D Surgery Wm F Haslam, M B , F R C S , and Charles Leedham Green, M B , Ch M , F R C S Anatomy Peter Thompson, M D (Dean of the Medical Faculty) Physiology E W Wace Carlier, M D Therapeutics Douglas Stanley, M D Forensic Medicine J T J Morrison, F R C S Hygiene and Public Health A. At the University of Birmingham the following Scholarships are awarded —(*a*) Myers Travelling Studentship of £150, tenable for one year, awarded by vote of committee to M B , Ch B Birm., B Sc candidates, tenable at some University or Hospital not in Great Britain or Ireland , (*b*) Ingleby Scholarship of £10, awarded to the candidate at Final Examination obtaining highest "first-class" marks in the subjects of Midwifery and Diseases of Women , (*c*) Sydenham Scholarship of £42, tenable for three years, award of Council to orphan sons of medical practitioners , (*d*) Sands Cox Scholarship of £42, tenable for three years, awarded to the candidate, not being more than 19 years of age, taking the highest marks at the July Matriculation , (*e*) Dental Scholarship of £37 10*s* , Open Competitive Examination in subjects learned during apprenticeship , (*f*), (*g*), (*h*), and (*i*) Four Queen's Scholarships of £10 10*s* each In the Second and Fourth Examinations the Scholarship is awarded respectively to the student taking the first place and obtaining "first-class" marks In the Third Examination the Scholarship is awarded to the student obtaining the highest "first-class" marks in Pathology and Bacteriology, provided that such student passes at the same examination in the subjects of Materia Medica and Practical Pharmacy In the Final Examination the Scholarship is awarded to the candidate taking the first place in the examination—that is, obtaining the greatest aggregate number of marks—provided that in each of the subjects of Medicine Surgery, and Midwifery he gains not less than 60 per cent of the total available marks , (*j*) George Henry Marshall Scholarship of £10, awarded annually, for the encouragement of Research Work in Ophthalmology, and (*k*) Russell Memorial Prize, a prize of books, value about £2, awarded annually to the student who, not being of more than six years' standing as a student of the School of Medicine of the University, shall pass the best examination in the subject of Nervous Diseases

Clinical Instruction —The medical students of the University receive their clinical instruction by attending the amalgamated practice of the General Hospital and the Queen's Hospital details of which follow

The clinical instruction of the Birmingham medical students is carried on under the direction of the University Clinical Board The hospitals present an excellent field for clinical work, possessing more than 500 beds, treating annually over 8000 in patients and 100,000 out-patients The students spend part of their curriculum in each hospital, and thus have every opportunity of acquiring a varied, full, and practical knowledge of their professional work. The curriculum is adapted in the first place to meet the needs of the students of the University of Birmingham, but it is also well adapted to the requirements of students preparing for the examinations of all other universities and licensing bodies. At the General Hospital there are open to the students the following appointments A resident medical officer, elected annually (£100), a resident surgical officer, elected annually and eligible for re election for three years (£100) , a resident pathologist, elected for six months (£50) , three surgical casualty officers, elected annually and eligible for re-election (£50) , three house physicians and four house surgeons hold office for six months, receiving board, residence, and salaries at the rate of £50 a year , two house surgeons to the gynæcological, ophthalmic, and aural departments are elected every six months, receiving board, residence, and a salary of £50 a year , two assistant house surgeons are elected every three months, receiving board, residence, and salaries at the rate of £40 a year , a resident medical officer at the Jaffray Hospital, who is elected annually but is eligible for re-election, and who receives £150 a year , and a resident medical assistant at this hospital, who is not necessarily qualified, is provided with board and residence, and holds office for three months. At the Queen's Hospital there are open to the student the following appointments Three house physicians, three house surgeons, and one obstetric and ophthalmic house surgeon, who hold office for six months and have salaries at the rate of £80 a year Thirty eight other appointments of varying value are at the City Workhouse and Workhouse Infirmary, at the Birmingham General and Branch Dispensaries, at the Birmingham Lunatic Asylums, at the City Fever Hospitals at the Children's Hospital, at the Birmingham and Midland Eye Hospital, at the Orthopædic and Spinal Hospital, at the Maternity Hospital, and at the Ear and Throat Hospital

THE BIRMINGHAM GENERAL HOSPITAL.—380 beds (280 for civilian patients and 100 for military patients) are in daily use, 5560 in patients per annum. Special wards for children, gynæcological, septic and infectious cases , special beds for eye, ear, and skin cases. About 50,000 out-patients per annum Laboratories for bacteriology and morbid histology Separate rooms adjoin the medical and surgical wards for clinical pathology Five operating theatres (one for out-patients), all designed and fitted on the most modern lines In addition to clinical teaching given in the wards and out-patient department by the honorary staff, medical and surgical tutorial classes are held for senior and junior students Clinical instruction in all the special departments. The Jaffray Branch Hospital contains 54 beds Consulting Surgeon Mr Gilbert Barling

Staff —Consulting Physician Dr Robert Saundby Consulting Obstetric Officer Dr Edward Malins Physicians Dr T Stacey Wilson, Dr T Sydney Short, Dr J W Russell, Dr A Stanley Barnes, and Dr W H. Wynn Surgeons Mr William F Haslam Mr George Heaton, Mr A Lucas, Mr Leonard P Gamgee, and Mr Frank Barnes Obstetric Physician Dr Thomas Wilson Aural Surgeon and Laryngologist (Vacant). Physician in Charge of Skin Department Dr A Douglas Heath Ophthalmic Surgeon Dr R Beatson Hird. Assistant Physicians Dr J E H Sawyer, Dr L G Parsons and Dr K D Wilkinson Assistant Surgeons Mr Seymour Barling, Mr E Musgrave Woodman, Mr H H Sampson, and Mr G P Mills Assistant Obstetric Officer Mr H B Whitehouse Anæsthetists Dr Sydney Haynes, Dr W J McCardie, and Mr R H R Whitaker Surgical Photographer and Radiographer Mr J Hall Edwards. Dental Surgeon Mr R H Astbury

THE QUEEN S HOSPITAL —Similar arrangements for clinical teaching are made here, and the material also is excellent. Ward and tutorial classes are regularly conducted by the staff, there are daily clinics in the out-patient department, while teaching duties are definitely assigned to the house physicians and house surgeons There are also special departments for gynæcology and ophthalmology

Staff —Consulting Physicians Sir James Sawyer, Dr O W Suckling, and Dr A. H Carter Consulting Surgeons awarded on the results of the Final Examination in Surgery in the Summer Term, £15 The Leech Fellowship (£100) is for the encouragement of study and research, and is open to persons who have graduated M B, Ch B, in the University not more than 18 months previously The Honorary Research Fellowships, tenable for two years, conferring the right of free use of the laboratories are awarded generally in October on application, with evidence of capacity for independent investigation

There are many entrance scholarships, the examinations for which are held in the month of May Full particulars can be obtained from the Dean

The Medical School —This medical school is located in a large building, which forms a part of the University It is provided with large dissecting rooms, physiological laboratories private laboratories, and work rooms, besides lecture rooms, a museum, and a library In order to give the fullest possible opportunities for teaching and investigation in the departments of Anatomy Physiology, Pathology, and Materia Medica, a large extension of the school buildings was made in 1895 A special laboratory, under the charge of Dr T Graham Brown is equipped for experimental work on the central nervous system. In the pathological laboratories ample provision is made for the teaching of pathology and bacteriology and for the prosecution of original research. The Helen Swindells Laboratory, under the charge of Dr Powell White, is specially equipped for cancer research and investigation in general pathology In the public health department, which is lodged in a separate institute in York Place, near the Royal Infirmary, suitable laboratory accommodation is provided for the study of sanitary chemistry, physics and practical bacteriology in the departments of chemistry and physics and in that of pathology

Clinical Studies —The clinical and practical departments of medical study are taught partly in the Medical School and partly in the Royal Infirmary and St Mary s Hospitals for Women and Children, as well as in a fever hospital, a lunatic asylum and a convalescent home Medical and Surgical Clinical Classes are conducted in the Infirmary, which together with the associated hospitals at Cheadle contains 1158 beds, and separate instruction is afforded in the elements of Medical and Surgical Physical Diagnosis in Obstetric Medicine Ophthalmic Surgery and Pathological Anatomy by the different members of the staff of the Medical School and Infirmary

Clinical Instruction —THE MANCHESTER ROYAL INFIRMARY —The Royal Infirmary is built on the pavilion system, near the University and has accommodation for 838 (including 516 temporary military beds). The remaining beds are allocated to civilians The medical side consists of five units, each unit having a testing room for the scientific investigation of morbid products and a class room The surgical beds are also arranged in five units each unit having its own operation theatre with anæsthetising, recovery sterilising testing, and apparatus rooms and its own class-room attached. Of these units all are occupied The fine educational block provides very handsomely for the wants and comforts of the students, there being separate suites of rooms for the men and the women and also a large common reading room a lecture theatre and a museum The present annual average number of in patients is 12,000 of out- and home patients 32 000, and the list of casualties in the accident room has averaged 22 000 per annum. About 8000 operations are performed annually in the operation theatres Associated with the infirmary are (1) the Convalescent Hospital at Cheadle containing 136 beds, (2) the Royal Lunatic Hospital at Cheadle, accommodating with its branches 430 patients, and (3) the Central Branch in the city for casualty and out-patient work and 62 temporary military beds The Associated Hospitals thus contain 1404 beds and are under the same management Women students are admitted to the practice of the Infirmary on the same terms as men

Fees —Medical Practice Three months, 5 guineas, six months 8 guineas, 12 months 12 guineas, full period required by the Examining Boards 42 guineas

Two Entrance Scholarships in Medicine of the value of £100 each are offered annually by the Council of the Manchester University and the Medical Board of the Manchester Royal Infirmary for proficiency in Arts and Science subjects respectively Other scholarships and prizes are in the College Syllabus Numerous annual appointments and junior appointments may be held by those who have attended the practice of the Infirmary

Staff —Consulting Physicians Dr Graham Steell, Dr Judson S Bury, Dr A. T Wilkinson, and Dr R T Williamson Physicians Dr E S Reynolds, Dr G R Murray, Dr E M Brockbank, Dr E N Cunliffe, and Dr F Craven Moore Assistant Physicians Dr A Ramsbottom, Dr E B Leech, Dr F E Tylecote, Dr C E Melland, and Dr D E Core Honorary Pathologists Dr H R Dean and Dr W B Anderton Consulting Surgeons Mr F A. Southam and Mr G A Wright Surgeons Mr W Thorburn, Mr J W Smith Mr A H. Burgess, Mr J H. Ray, and Mr E D Telford Assistant Surgeons Mr C Roberts Mr P R Wrigley, Mr H H Rayner, Mr W H Hey, and Mr J P Buckley Anæsthetist Mr Alexander Wilson Consulting Obstetric Physician Dr Lloyd Roberts Gynæcological Surgeon Dr A. Donald Assistant Gynæcological Surgeon Dr W E Fothergill Ophthalmic Surgeon Dr A. Hill Griffith Aural Surgeon Sir William Milligan Assistant Aural Surgeon Mr F H Westmacott Consulting Dental Surgeon Mr W A. Hooton Dental Surgeon Mr E G Long Dean Dr E M Brockbank Resident Medical Officer Dr A. Burrows Resident Surgical Officer Mr John Gow Pathological Registrar Dr W B Anderton Medical Registrar Dr D T Harris Surgical Registrar Mr Howard Buck Director of the Clinical Laboratory Dr G E Loveday Anæsthetists Mr S R Wilson, Mr Edward Moir, Mr E Falkner Hill, Mr T Coogan, Mr G M Benton, and Miss Mabel E May Assistant Medical Officers Dr C E Lea and Dr J F Ward Acting Assistant Medical Officers Dr J S B Stopford and Dr W T Reid Assistant Surgical Officers Mr W R Douglas and Mr Howard Buck. Surgical Tutor Mr W R Douglas Medical Officer for Home Patients Dr George Ashton Medical Officer for Radiography and Electricity Department Dr A E Barclay Resident Medical Officer of the Convalescent Hospital Cheadle Mr C R Sandiford Resident Superintendent of the Royal Lunatic Hospital at Cheadle Mr W Scowcroft. Medical Officer, Central Branch Mr Alan Barrett General Superintendent and Secretary Mr F G Hazell

MANCHESTER CHILDREN S HOSPITAL Pendlebury, Gartside street Manchester and St Anne s-on the Sea.—The hospital contains 188 beds and 24 in the Convalescent Home, St Anne s-on the Sea The medical staff visit the hospital daily at 10 A M Clinical instruction is given by the medical staff at the Hospital and Dispensary Out-patients are seen daily at 9 A M at the new Out-patient Department, Gartside-street Manchester Physicians Dr Heywood, Dr Lapage, and Dr Ashby Surgeons Mr C Roberts Mr H H Rayner and Mr John Morley Honorary Consulting Surgeons Mr G A Wright and Mr J Howson Ray Honorary Consulting Aural Surgeon Mr F H Westmacott Surgeon for Throat, Nose and Ear Diseases Mr Arnold Jones Honorary Ophthalmic Surgeon Dr J Gray Clegg Pathologist Mr A H Miller Anæsthetists Mr E Moir and Mr S R. Wilson Honorary Dental Surgeon Mr E A T Green Medical Officers at the Dispensary Mr K. B Pinson and Mr A W Walsh Medical Officer, X Ray Department Dr W J S Bythell. During 1916 there were 2539 in patients, and 21,255 new out-patients were under treatment at the Dispensary and there were 86 612 attendances made by out-patients Secretary Mr W M Humphry

THE MANCHESTER NORTHERN HOSPITAL FOR WOMEN AND CHILDREN Park place Cheetham Hill road, Manchester —The hospital contains 70 beds Out patients are seen daily from 8 30 to 10 A M Honorary Consulting Physicians Dr W N Maccall Dr T C Railton, and Dr J J Cox. Honorary Consulting Surgeon Mr Frederick A. Southam Honorary Physician for Women Dr T Arthur Helme. Honorary Surgeon for Women Dr G W Fitz Gerald Honorary Physicians for Children Dr A. A Mumford, Dr A. C Sturrock and Dr C Chisholm Honorary Assistant Surgeon for Women Dr D Dougal. Honorary Surgeon for Children Dr R Ollerenshaw Honorary Ophthalmic Surgeon Dr H H McNabb Honorary Anæsthetists Mr G A Barrow Dr C H Lee, and Dr D H. Paul Honorary Clinical Pathologist Dr J Staveley-Dick Pathologist Dr A. H. Miller Assistant Medical Officer Mr R W Walsh House Surgeon (Temporarily filled)

Special Diplomas —The University has instituted diplomas in *Anatomy, Bacteriology, Bio chemistry, and Parasitology* A special course of study of three terms' duration is required in the subject chosen for the diploma and allied subjects

Prospectuses and further information may be had on application to the Dean of the Faculty of Medicine, University of Liverpool

Staff of the Royal Infirmary —Consulting Physicians Dr T R Glynn, Dr R Caton, and Sir James Barr Physicians Dr T R Bradshaw, Dr J Hill Abram, and Dr R. J M Buchanan *Assistant Physicians Dr John Hay* and Dr W Barnett Warrington Consulting Surgeons Mr Rushton Parker and Mr F T Paul Surgeons Mr R A Bickersteth, Mr W Thelwall *Thomas, and Mr Litler Jones* Assistant Surgeons Mr R E Kelly Mr F A. G Jeans, and Mr H F Woolfenden Consulting Gynæcological Surgeon Mr T B Grimsdale Gynæcological Surgeon Mr W Blair Bell Ophthalmic Surgeon Mr T H Bickerton Surgeon to the Throat Department Mr Thomas Guthrie Physician to the Skin Department Dr L Roberts Lock Department Dr F P Wilson X Ray and Radium Departments Dr O Thurstan Holland Dental Surgeon Dr S Hallam Chemical Pathologist Dr Walter Ramsden Pathologist Dr E E Glynn Anæsthetists Mr W Fingland, Mr F W Bailey, Mr H Armstrong, Mr A J O'Leary, Dr Mona Roberts Mr Bennett Jones, and Mr G F R Smith

Staff of the David Lewis Northern Hospital —Physician Dr John Owen Assistant Physician Dr J M Bligh Surgeons Mr K W Monsarrat and Mr G O E Simpson Assistant Surgeons Mr J H Rawlinson and Mr T P McMurray Consulting Neurologist Dr W B Warrington Consulting Gynæcological Surgeon Mr H Leith Murray Consulting Aural Surgeon and Laryngologist Dr Hugh E Jones Consulting Dental Surgeon Mr Leslie Councell Surgeon in Charge of Orthopædics and Massage Dr W H Broad Anæsthetists Dr Robert Stevenson, Dr H J Knox, Dr W R Pearce, and Mr A. J W Cunningham Pathologist Dr H S Pemberton Medical Officer in Charge of Finsen Light and Roentgen Ray Department Dr W C Oram Bacteriologist Dr L S Ashcroft

Women are now accepted for resident appointments

Staff of the Royal Southern Hospital —Consulting Physician Dr W Williams Consulting Surgeon Mr W Alexander Consulting Bacteriologist *Professor* J M Beattie Honorary Physicians Dr C J Macalister and Dr J L Roberts Honorary Surgeons Sir R Jones, *Mr G P* Newbolt, and Mr *Douglas-Crawford* Honorary Assistant Surgeons Mr T R W Armour and Mr O H Williams Honorary Dermatologist Dr F H Barendt. Honorary Ophthalmic Surgeon Mr R J *Hamilton* Honorary Laryngologist Dr W Permewan Honorary Assistant Laryngologist Dr W Sanderson Radiologist Dr D Morgan *Honorary Dental Surgeon* Mr L Osborn Anæsthetists Dr F M Gardner Medwin Dr W J Bennett Jones, Dr G F R Smith, and Dr T E Jones

Staff of the Stanley Hospital —Consulting Physicians Dr R I Richardson and Dr W Whitford Physician Dr A G Gullan Surgeons Mr F O Larkin and Mr A J Evans Gynæcology Miss F Ivens, M B, M S Ophthalmic Physician Dr J Grimshaw Laryngologist Dr J E McDougall Dentist Mr J Woodford Williams

---

THE VICTORIA UNIVERSITY OF MANCHESTER

Four degrees in Medicine and Surgery are conferred by the University—viz , Bachelor of Medicine and Bachelor of Surgery (M B and Ch B), Doctor of Medicine (M D), and Master of Surgery (Ch M) A Diploma in Psychological Medicine is awarded by examination to *registered* medical practitioners

Degrees of Bachelor of Medicine and Bachelor of Surgery —Before admission *to the degree of M B or Ch B* candidates are required to present certificates that they will have attained the age of 21 years on the day of graduation and *that* they have pursued the courses of study required by the University Regulations during a period of not less than five years subsequently to the date of their registration by the General Medical Council, two of such years having been passed in the University and one year at least having been passed in the University subsequently to the date of passing the first M B Examination All candidates for the degrees of Bachelor of Medicine and *Bachelor* of Surgery are required to satisfy the examiners in the several subjects of the following examinations the First Examination, the Second Examination, the Third Examination, and the Final Examination.

The First Examination —The subjects of examination are as follows —(1) Inorganic Chemistry and Physics, (2) Biology, and (3) Elementary Organic Chemistry and Bio-Chemistry Candidates must have attended during at least one year courses both of lectures and of laboratory work *in each of the above named subjects* The Examination is divided into three parts Part 1, Inorganic Chemistry and Physics, Part 2, Biology, Part 3, Elementary *Organic Chemistry and Bio Chemistry, and the candidates* may pass in these parts separately under certain conditions

The Second Examination —The subjects of examination are as follows —(1) Anatomy, (2) Physiology, including Physiological Chemistry and Histology Candidates may pass in (1) and (2) separately under certain conditions

The Third Examination —(1) Pathology, (2) Pharmacology and Therapeutics, (3) Hygiene These subjects may be taken separately under certain conditions.

The Final Examination —The subjects of examination are as follows —(1) Medicine, Systematic and Clinical (including Mental Diseases and Diseases of Children), (2) Surgery, Systematic, Clinical, and Practical, (3) Obstetrics and Gynæcology (including Clinical and Practical), (4) Forensic Medicine (including an Oral Examination) These subjects may be taken separately under certain conditions

Candidates for the Final Examination must have completed the fifth year of medical study

Degree of Doctor of Medicine —Candidates are not eligible for the degree of Doctor of Medicine unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees Candidates may elect either (1) to present an original dissertation, or (2) to undergo an examination The dissertation must embody the results of personal observation or original research, either in some department of medicine or of some science directly relative to medicine The examination, which will be partly written, partly practical, is in the Principles and Practice of Medicine, in Pathology, and in some other subject to be selected by the candidate

Degree of Master of Surgery —Candidates are not eligible *for the degree of Master of Surgery* unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed *since they passed the examination* for those degrees The subjects of examination are as follows (1) Surgical Anatomy, (2) Surgery, (3) Operative Surgery, (4) Clinical Surgery, (5) Ophthalmology, and (6) Pathology and Bacteriology

Professors—Physics Sir E Rutherford, D Sc., LL.D, F R S Chemistry H B Dixon F R S Organic Chemistry Arthur Lapworth, D Sc, F R S Zoology S J *Hickson*, D Sc, F R S. Botany F E Weiss, D Sc, F R S. Cryptogamic Botany W H Lang M B, D Sc, F R.S. Communications should be addressed to the Registrar, The University, Manchester

Scholarships, Fellowships, and Prizes —At this University there are 22 Foundation Scholarships, 12 Exhibitions, five being for subjects connected with medical study, a Surgical Prize, a Fellowship, Research Fellowships in Public Health, and Honorary Research Fellowships 13 Scholarships are Entrance Scholarships one is Medical, and there are one each for Surgery, Biology, Physiology, and Diseases of Children, and one General Medical and Surgical Three of *the* Exhibitions are for Physiology one for Anatomy, and one for French and German The Surgical Prize, named "The Dumville," is

Professors—Physics W M Hicks, Sc D , F R.S Chemistry W Palmer Wynne, D Sc , F R S Biology Alfred Denny, M Sc F L S Anatomy C J Patten, M.A. M D Sc.D Physiology J B Leathes M B , F R.S Medicine A J Hall, M A , M D , F R C P Surgery Sinclair White, M D , M Ch , F R C S Pathology J Sholto C Douglas, M A , M D Midwifery P E Barber, B A. M R C S , L R C P Public Health H Scurfield, M D , D P H Dean of the Medical Faculty J B Leathes M B , F R S

Scholarships &c —At this University, in addition to four Edgar Allen scholarships of £100 a year for three years holders of which can take the courses in the Faculty of Medicine there are 8 scholarships and a Town Trust Fellowship Full particulars as to curriculum scholarships, &c., may be had on application to the Registrar or to the Dean of the Medical Faculty

The Medical School —The new buildings of the University opened in 1905 are situated at the west end of the city, adjoining Weston Park, and the Medical Department occupies the entire north wing of the University quadrangle The various athletic and other students' societies are under the management of a Students' Representative Council, elected annually There are large and comfortable common rooms both for men and women students A refectory is open daily at the University where students may obtain refreshments, lunch, dinner &c , at extremely moderate prices The University journal, *Floreamus*, edited by a committee of staff and students is published each term The University Hostel, Ashgate road, is recognised by the Senate as a residence for women students, full particulars of which may be obtained of the tutor for women students

Clinical Instruction —The University is within easy reach of the various hospitals with which it is connected for clinical purposes These are as follows The Royal Infirmary containing 320 beds, with an annual average number of over 3800 in patients, over 11 500 out-patients and over 23 000 casualties , the Royal Hospital, with 191 beds and an annual number of 3000 in patients, over 20 000 out patients and nearly 20 000 casualties , and the *Jessop Hospital* for Diseases of Women with 80 beds about 750 in patients, and over 3000 out-patients , also a Maternity department, with about 450 in patients per annum and about 700 out patient cases attended Special courses on Fevers are held at the City Fever Hospitals (570 beds) and on Mental Diseases at the South Yorkshire Asylum (1610 beds) For purposes of clinical practice the practices of the Royal Infirmary and Royal Hospital are amalgamated giving a total of 511 beds for the treatment of medical, surgical, and special cases There are special departments for the treatment of Diseases of the Eye at each institution with wards assigned to them In addition to these the Royal Infirmary has special departments for the treatment of Diseases of the Skin and Ear with beds assigned to them whilst at the Royal Hospital there are special out patient departments for Diseases of the Throat Ear Skin Orthopædics and Mental Diseases During the last year over 6000 patients passed through the wards of the two institutions while those attending as out patients numbered over 45 000 The department of Pathology and Bacteriology in the University is fitted with every requirement for the most advanced work in these subjects

Fees —The Composition Fees are as follows A for University Lectures and Practical Classes £80 , B, for Clinical Hospital Practice £49 17s 6*d* These two composition fees entitle the student to attendance on *all* the Lectures Laboratory Classes and Hospital practice (except Pharmacy) required for a Medical and Surgical Degree in the University or for the ordinary qualifying examinations of the various Examining Boards The composition fees do not cover the cost of apparatus instruments parts for dissection in anatomy &c all of which must be provided by the student when and as required The fees are payable in instalments extending over the five years of the curriculum

Staff of the Royal Infirmary Sheffield —Physicians Dr W S Porter Dr A F Barnes, and Dr A G Yates Surgeons Professor Sinclair White Mr Arthur Connell and Mr Archibald Cuff Assistant Surgeons Mr Ernest Finch and Mr T I Mount Dermatologist Dr Rupert Hallam Honorary Pathologist Professor J Sholto C Douglas Medical Officer to the Ear and Throat Department Mr W S Kerr Ophthalmic Surgeon Mr G H Pooley Medical Registrar Dr W W King Medical Officer in Charge of Electrical Department Dr Rupert Hallam Anæsthetists Dr W D Mart, Dr W Sneddon, Dr T Robertson, and Dr Norton Milner Clinical Pathologist Dr W W King Honorary Secretary to the Medical and Surgical Staff Mr W S Kerr Secretary to the Infirmary Jno W Barnes

Staff of the Sheffield Royal Hospital —Physicians Professor Arthur Hall and Dr A E Naish Surgeons Mr Graham Simpson and Mr Garrick Wilson Assistant Physician Dr Herbert Henry Assistant Surgeons Mr Ferguson Wilson and Mr Vincent Townrow Ophthalmic Surgeon Dr Percival J Hay Assistant Ophthalmic Surgeon Mr Herbert Emmerson Aural Surgeon Dr George Wilkinson Physician for Mental Diseases Mr Gilbert E Mould Medical Officer to the Electrical Department Dr W Harwood Nutt Physician for Skin Diseases Dr E F Skinner Anæsthetists Mr Herbert Hallam, Dr C Graham Murray, Dr R G Abercrombie, Dr Vernon Favell and Mr J B H Holroyd. Pathologist Professor J Sholto C Douglas Honorary Secretary to the Medical and Surgical Staff Mr J B Ferguson Wilson (*pro tem*). Dental Surgeons Mr F G Mordaunt, Mr P S Stokes, and Mr H J Stoner Assistant Dental Surgeons Mr R. Cecil Webster Mr F W Goodwin, Mr J H Skerritt, Mr. W Skerritt and Mr Frank C Harrison Honorary Secretary to the Dental Staff Mr F G Mordaunt (*pro tem*)

UNIVERSITY OF BRISTOL

In the Faculty of Medicine there are the following degrees —Bachelor of Medicine and Bachelor of Surgery (M B and Ch B) Doctor of Medicine (M D), Master of Surgery (Ch M), Bachelor of Dental Surgery (B D S), and Master of Dental Surgery (M D S) There are also the following diplomas Diploma in Public Health (D P H), Diploma in Dental Surgery (L D S), and Diploma in Veterinary State Medicine.

All candidates for degrees in Medicine, Surgery, and Dentistry are required to pass an examination called the Matriculation Examination, which must include Latin or to pass such examination as may be regarded as equivalent by the Senate All courses, degrees, and diplomas are open to men and women alike

Conjoined Degrees of Bachelor of Medicine and Bachelor of Surgery —Candidates shall be not less than 21 years of age and shall have pursued the courses prescribed by University Regulations during not less than five and a half years, of which three shall have been passed in the University, and two of these three subsequent to pass in the second examination All candidates for the degrees of M B , Ch.B , are required to satisfy the examiners in the several subjects of three examinations

The First Examination —The subjects of examination are Chemistry (Inorganic) Physics, and Biology the courses pursued being those for the time being approved for the intermediate part of the B Sc curriculum This part of the curriculum shall extend over one year

The Second Examination —The subjects of examination are Organic Chemistry and Elementary Anatomy (Part I) and Advanced Anatomy and Physiology (Part II) Parts I and II may be passed separately or together

The Final Examination —The subjects of examination are Materia Medica and Pharmacy, Pharmacology and Therapeutics General Pathology, Morbid Anatomy and Bacteriology (Part I) Special Pathology Forensic Medicine, Toxicology and Public Health, Obstetrics (including Diseases of Women), Surgery (Systematic Clinical Practical and Operative) Medicine (Systematic Clinical, and Practical including Mental Diseases) (Part II) Candidates may pass I and II together or separately and Forensic Medicine and Toxicology may at the option of the candidate, be taken either with Part I or Part II

Degree of Doctor of Medicine —Candidates shall be Bachelors of the University of not less than two years standing as such and may elect either (1) to pass an examination in General Medicine, or (2) to pass an examination in State Medicine or (3) to present a Dissertation The candidate who elects to pass the examination in State Medicine must hold a diploma in Public Health of some University or College and the candidate who elects to present a Dissertation may be examined in the subject thereof

UNIVERSITY OF LEEDS

Four degrees in Medicine and Surgery are conferred—viz Bachelor of Medicine and Bachelor of Surgery (M B and Ch B) Doctor of Medicine (M D) Master of Surgery (Ch M), also Degrees and Diplomas in Dental Surgery and Diploma in Public Health A Diploma in Psychological Medicine is also granted

Degrees of Bachelor of Medicine and Bachelor of Surgery —Candidates for the degrees of Bachelor of Medicine and of Surgery are required to present certificates showing that they will have attained the age of 21 years on the day of graduation, and have attended courses of instruction approved by the University extending over not less than five years, two of such years at least having been passed in the University subsequently to the date of passing the First Examination Candidates must also satisfy the examiners in the several subjects of the following examinations entitled respectively the Matriculation Examination, or such other examination as may have been recognised by the Joint Matriculation Board in its stead, the First Examination, the Second Examination, and the Final Examination

The First Examination —The First Examination consists of Part I, Physics and Chemistry, Part II, Biology Candidates will be allowed to pass the two parts separately

The Second Examination —The Second Examination consists of Part I, Anatomy and Physiology, Part II, Materia Medica and Pharmacy Candidates will be allowed to pass the two parts separately

The Final Examination —The Final Examination consists of Part I, Pathology and Bacteriology Part II, Forensic Medicine and Public Health Part III, Medicine Systematic and Clinical, including Mental Diseases and Diseases of Children, Surgery Systematic, Clinical, and Practical, Obstetrics, and Gynæcology Systematic, Clinical and Practical, Pharmacology and Therapeutics Candidates will be allowed to pass Parts II and III separately or together, and they may present themselves for examination in Part I at the end of the tenth term

Degree of Doctor of Medicine —Candidates are not eligible for the degree of Doctor of Medicine or Master of Surgery unless they have previously received the degrees of Bachelor of Medicine and Bachelor of Surgery and at least one year has elapsed since they passed the examination for those degrees Candidates for the degree of Doctor of Medicine are required to present a dissertation and, if the dissertation be accepted, to pass an examination

Professors—Physics (Vacant) Chemistry A Smithells B Sc, F R S Organic Chemistry J B Cohen B Sc Ph D F R S Zoology W Garstang M A, D Sc Botany J H Priestley, B Sc Anatomy J K Jamieson, M B Physiology and Histology (Vacant) Pathology A S Leyton, M D Sc D Clinical Medicine A. Information concerning scholarships and prizes can be obtained from the Dean of the Medical School

Clinical Instruction —THE LEEDS GENERAL INFIRMARY, in connexion with this medical faculty, has accommodation for 620 in patients including 88 beds at branch hospitals in the country During the last year 10 222 in patients and 34 819 out patients were treated. Clinical teaching takes place daily in the wards, and Clinical lectures are given in Medicine and Surgery by the Physicians and Surgeons There are Medical, Surgical Ophthalmic Aural, Electro therapeutic and Radiographic Departments in each of which special instruction is imparted to students A Gynæcological and Extern Obstetric Department, together with Laryngeal and Skin Clinics are in operation Several valuable prizes are given at the end of each session. Numerous appointments at the Infirmary are annually open to students after qualification

Staff of Leeds General Infirmary —Consulting Physicians Sir Thomas Clifford Allbutt, K C B, Dr John E Eddison Dr Charles M Chadwick and Dr Alfred George Barrs Consulting Surgeons Mr Thomas Pridgin Teale Mr A W Mayo Robson, Mr Edward Ward, and Mr Harry Littlewood Physicians Dr Thomas Churton, Dr T Wardrop Griffith, and Dr W H Maxwell Telling Surgeons Mr R Lawford Knaggs, Sir Berkeley Moynihan, Mr Walter Thompson, and Mr J Faulkner Dobson Ophthalmic Surgeons Mr H Secker Walker and Mr A. L Whitehead. *Ear Nose and Throat Surgeons* Mr G Constable Hayes and Mr E W Bain Obstetric Physician Dr J B Hellier Assistant Physicians Dr Geo W Watson, Dr R. A. Veale, and Dr C W Vining Assistant Surgeons Mr H Collinson, Mr L R. Braithwaite, Mr J A Coupland, and Mr S W Daw Pathologist Dr A S Leyton. Dental Surgeon Mr J B Hordern Director of the Electro-Therapeutic Department (Vacant) Clinical Pathologist Mr M J Stewart Assistant Clinical Pathologist (Vacant). Medical Tutor Dr J Le F C Burrow Surgical Tutor Mr A Richardson Anæsthetists Dr Douglas Seaton, Dr S T Rowling, Dr F Whalley, Dr Macvean, Dr F Marshall Greaves, Dr A. E. Hutton, Dr C T Matthews, Dr W Maxwell Munby, Dr R H B Adamson and Dr C E Dawson General Manager Mr Fred J Bray

---

UNIVERSITY OF SHEFFIELD

The Degrees in the Faculty of Medicine are Bachelor of Medicine and Bachelor of Surgery (M B Ch B), Doctor of Medicine (M D), and Master of Surgery (Ch M). The courses and degrees in the Faculty of Medicine are open to men and women alike

Candidates for a medical degree shall have matriculated in the University or have passed such other examination as may be recognised for this purpose by the University and sanctioned by the Joint Matriculation Board

A candidate for the degrees of M B Ch B, shall produce certificates that he will have attained the age of 21 years on the day of graduation, that he has pursued the courses of study required by the University regulations during a period of not less than five years subsequently to the date of his matriculation three of such years at least having been passed in the University one at least being subsequent to the passing of the First Examination

Degrees of Bachelor of Medicine and Bachelor of Surgery

The First Examination —The subjects of the examination are Chemistry, Physics, and Biology The Intermediate B Sc Examination in these subjects will, on payment of the required additional fee, be accepted instead of this examination Candidates must, after matriculation and registration as medical students have attended courses of instruction (lectures and laboratory work) in chemistry, physics and biology for one year each

The Second Examination —The subjects of the examination are Anatomy and Physiology

The Third Examination —The subjects of the examination are Pathology and Pharmacology A candidate entering for the first, second, or third examination, who shall pass creditably in one subject of either examination and obtain a certain minimum of marks in the other, may enter for such other subject separately in a subsequent examination Candidates must have completed the fourth year of professional study

The Final Examination —The subjects of the examination are Medicine (including Forensic Medicine, Public Health, Mental Diseases and Diseases of Children), Surgery; and Obstetrics (including Gynæcology) Candidates must satisfy the examiners in all subjects at the same examination Candidates must have completed the fifth year of professional study

Degree of Doctor of Medicine —Candidates for the degree of Doctor of Medicine must have passed the examination for the degrees of M B, Ch B at least one year previously, must present a thesis embodying observations in some subject approved by the professor of medicine, and must pass an examination in the Principles and Practice of Medicine

Degree of Master of Surgery —Candidates for the degree of Ch M must have passed the examination for the degrees of M B Ch B at least one year previously and must, since taking the degrees of M B, Ch B, have held for not less than six months a surgical appointment in a public hospital or other public institution, affording full opportunity for the study of Practical Surgery

The subjects of examination are Systematic Clinical and Operative Surgery, Surgical Anatomy, Surgical Pathology, and Bacteriology

Professors—Physics W M Hicks, Sc.D , F R S Chemistry W Palmer Wynne D Sc., F R S Biology Alfred Denny, M Sc F L S Anatomy C J Patten M.A. M D Sc.D Physiology J B Leathes M B , F R S Medicine A J Hall, M A., M D , F R.C P Surgery Sinclair White M D , M Ch. F R C S Pathology J Sholto C Douglas, M A M D Midwifery P E Barber B A., M R.C S L.R.C P Public Health H Scurfield M D D P H Dean of the Medical Faculty J B Leathes M B F R S

Scholarships &c—At this University, in addition to four Edgar Allen scholarships of £100 a year for three years holders of which can take the courses in the Faculty of Medicine there are 8 scholarships and a Town Trust Fellowship Full particulars as to curriculum scholarships &c. may be had on application to the Registrar or to the Dean of the Medical Faculty

The Medical School—The new buildings of the University opened in 1905 are situated at the west end of the city, adjoining Weston Park, and the Medical Department occupies the entire north wing of the University quadrangle The various athletic and other students' societies are under the management of a Students Representative Council, elected annually There are large and comfortable common rooms both for men and women students A refectory is open daily at the University where students may obtain refreshments lunch dinner, &c., at extremely moderate prices The University journal, *Floreamus* edited by a committee of staff and students is published each term The University Hostel Ashgate-road is recognised by the Senate as a residence for women students full particulars of which may be obtained of the tutor for women students

Clinical Instruction—The University is within easy reach of the various hospitals with which it is connected for clinical purposes These are as follows The Royal Infirmary containing 320 beds with an annual average number of over 3800 in patients over 11 500 out-patients and over 23 000 casualties , the Royal Hospital with 191 beds and an annual number of 3000 in patients over 20 000 out patients and nearly 20 000 casualties, and the Jessop Hospital for Diseases of Women with 80 beds about 750 in patients and over 3000 out-patients, also a Maternity department, with about 450 in patients per annum and about 700 out-patient cases attended Special courses on Fevers are held at the City Fever Hospitals (570 beds) and on Mental Diseases at the South Yorkshire Asylum (1610 beds) For purposes of clinical practice the practices of the Royal Infirmary and Royal Hospital are amalgamated giving a total of 511 beds for the treatment of medical, surgical, and special cases There are special departments for the treatment of Diseases of the Eye at each institution with wards assigned to them In addition to these the Royal Infirmary has special departments for the treatment of Diseases of the Skin and Ear with beds assigned to them whilst at the Royal Hospital there are special out patient departments for Diseases of the Throat Ear Skin Orthopædics and Mental Diseases During the last year over 6000 patients passed through the wards of the two institutions while those attending as out-patients numbered over 45 000 The department of Pathology and Bacteriology in the University is fitted with every requirement for the most advanced work in these subjects

Fees—The Composition Fees are as follows A for University Lectures and Practical Classes £80 , B for Clinical Hospital Practice £49 17s 6*d* These two composition fees entitle the student to attendance on *all* the Lectures Laboratory Classes and Hospital practice (except Pharmacy) required for a Medical and Surgical Degree in the University or for the ordinary qualifying examinations of the various Examining Boards The composition fees do not cover the cost of apparatus instruments parts for dissection in anatomy &c all of which must be provided by the student when and as required The fees are payable in instalments extending over the five years of the curriculum

Staff of the Royal Infirmary Sheffield—Physicians Dr W S Porter Dr A F Barnes and Dr A G Yates Surgeons Professor Sinclair White Mr Arthur Connell and Mr Archibald Cuff Assistant Surgeons Mr Ernest Finch and Mr T B Mouat Dermatologist Dr Rupert Hallam Honorary Pathologist Professor J Sholto C Douglas Medical Officer to the Ear and Throat Department Mr W S Kerr Ophthalmic Surgeon Mr G H Pooley Medical Registrar Dr W W King Medical Officer in Charge of Electrical Department Dr Rupert Hallam Anæsthetists Dr W D Mart Dr W Sneddon, Dr T Robertson, and Dr Norton Milner Clinical Pathologist Dr W W King Honorary Secretary to the Medical and Surgical Staff Mr W S Kerr Secretary to the Infirmary Jno W Barnes

Staff of the Sheffield Royal Hospital—Physicians Professor Arthur Hall and Dr A E Naish Surgeons Mr Graham Simpson and Mr Garrick Wilson Assistant Physician Dr Herbert Henry Assistant Surgeons Mr Ferguson Wilson and Mr Vincent Townrow Ophthalmic Surgeon Dr Percival J Hay Assistant Ophthalmic Surgeon Mr Herbert Emmerson Aural Surgeon Dr George Wilkinson Physician for Mental Diseases Mr. Gilbert E Mould Medical Officer to the Electrical Department Dr W Harwood Nutt Physician for Skin Diseases Dr E F Skinner Anæsthetists Mr Herbert Hallam Dr C Graham Murray, Dr R G Abercrombie, Dr Vernon Favell and Mr J B H Holroyd. Pathologist Professor J Sholto C Douglas Honorary Secretary to the Medical and Surgical Staff Mr J B Ferguson Wilson (*pro tem*). Dental Surgeons Mr F G Mordaunt, Mr P S Stokes and Mr H J Stoner Assistant Dental Surgeons Mr R. Cecil Webster Mr F W Goodwin Mr J H Skerritt Mr. W Skerritt and Mr Frank C Harrison Honorary Secretary to the Dental Staff Mr F G Mordaunt (*pro tem*)

UNIVERSITY OF BRISTOL

In the Faculty of Medicine there are the following degrees —Bachelor of Medicine and Bachelor of Surgery (M B and Ch B) Doctor of Medicine (M D) Master of Surgery (Ch M) Bachelor of Dental Surgery (B D S) and Master of Dental Surgery (M D S) There are also the following diplomas Diploma in Public Health (D P H), Diploma in Dental Surgery (L D S) and Diploma in Veterinary State Medicine.

All candidates for degrees in Medicine Surgery, and Dentistry are required to pass an examination called the Matriculation Examination, which must include Latin, or to pass such examination as may be regarded as equivalent by the Senate All courses degrees, and diplomas are open to men and women alike

Conjoined Degrees of Bachelor of Medicine and Bachelor of Surgery—Candidates shall be not less than 21 years of age and shall have pursued the courses prescribed by University Regulations during not less than five and a half years of which three shall have been passed in the University, and two of these three subsequent to pass in the second examination All candidates for the degrees of M B , Ch.B are required to satisfy the examiners in the several subjects of three examinations

The First Examination—The subjects of examination are Chemistry (Inorganic) Physics, and Biology the courses pursued being those for the time being approved for the intermediate part of the B Sc. curriculum. This part of the curriculum shall extend over one year

The Second Examination—The subjects of examination are Organic Chemistry and Elementary Anatomy (Part I) and Advanced Anatomy and Physiology (Part II) Parts I and II may be passed separately or together

The Final Examination—The subjects of examination are Materia Medica and Pharmacy Pharmacology and Therapeutics General Pathology, Morbid Anatomy and Bacteriology (Part I) Special Pathology Forensic Medicine Toxicology and Public Health Obstetrics (including Diseases of Women) Surgery (Systematic Clinical Practical and Operative) Medicine (Systematic Clinical and Practical including Mental Diseases) (Part II) Candidates may pass I and II. together or separately, and Forensic Medicine and Toxicology may at the option of the candidate be taken either with Part I or Part II

Degree of Doctor of Medicine—Candidates shall be Bachelors of the University of not less than two years standing as such and may elect either (1) to pass an examination in General Medicine or (2) to pass an examination in State Medicine, or (3) to present a Dissertation The candidate who elects to pass the examination in State Medicine must hold a diploma in Public Health of some University or College and the candidate who elects to present a Dissertation may be examined in the subject thereof

Degree of Master of Surgery —Candidates shall be Bachelors of not less than two years as such, during which period they shall have attended the Surgical Practice of an institution approved for the purpose They shall pass an examination in Surgical Anatomy, Pathology, and Bacteriology, and Operative, Clinical, and General Surgery, and present to the University a Dissertation on some subject of Surgery

Professors—Chemistry Francis Francis, D Sc , Ph D Anatomy Edward Fawcett, M D , C M (Dean of the Faculty of Medicine) Physiology A F Stanley Kent, M A., D Sc Pathology I Walker Hall, M D , C M Obstetrics W C Swayne, M D , B S Surgery C A Morton, F R C S , and James Swain, M D , F R C S Medicine F H Edgeworth, M D , B C D Sc and J Michell Clarke M D , LL D , F R C P

Clinical Instruction —The allied hospitals (Bristol Royal Infirmary and Bristol General Hospital) have between them about 600 beds and extensive out-patient departments, special clinics for Diseases of Women and Children and those of the Eye, Throat, and Ear, in addition to large and well equipped departments for Dental work and large outdoor Maternity Departments

At each of these institutions there are well arranged pathological museums, post-mortem rooms, and laboratories for Morbid Anatomy There are also laboratories for work in Clinical Pathology, Bacteriology, and Cytology, in which special instruction is given in these subjects Departments are provided and well equipped for X ray work, both for diagnosis and treatment, the various forms of Electrical treatment, including High Frequency Currents, Electric Baths, Finsen Light treatment, and Massage

The students of the school also attend the practice of the Royal Hospital for Sick Children and Women, containing 140 beds, and that of the Bristol Eye Hospital, with 40 beds The total number of beds available for clinical instruction is therefore about 750

Staff of the Bristol Royal Infirmary —Honorary and Consulting Physicians Dr R Shingleton Smith, Dr H Waldo, and Dr J E Shaw Honorary and Consulting Surgeons Mr E C Board, Mr W H Harsant, Mr A. W Prichard, and Mr J Paul Bush Honorary and Consulting Ophthalmic Surgeon Mr F Richardson Cross Honorary Physicians Dr A B Prowse, Dr F H Edgeworth, Dr J A Nixon (Dean of the Faculty of the Royal Infirmary) and Dr J R Charles Honorary Surgeons Dr J Swain, Mr T Carwardine, Mr H F Mole and Mr C F Walters Honorary Ophthalmic Surgeon Mr E H E Stack Honorary Obstetric Physician Dr Walter Swayne Honorary Dental Surgeon Mr W R Ackland Honorary Physician to the Nose and Throat Department Dr P Watson Williams Honorary Assistant Physicians Dr J M Fortescue Brickdale and Dr Richard Clarke. Honorary Assistant Surgeons Mr A Rendle Short and Mr H Chitty Honorary Assistant Dental Surgeon Mr F C Nichols Pathologist Dr I Walker Hall Honorary Demonstrator of Morbid Anatomy Dr J J S Lucas Assistant Pathologist Dr J R Kay Mouatt Honorary Anæsthetist Mr A L Flemming Honorary Assistant Anæsthetists Mr S V Stock, Mr Leonard Moore and Mr B O Eskell Honorary Skiagraphist Mr James Taylor Facilities for women students are granted

Staff of the Bristol General Hospital —Honorary and Consulting Physicians Dr A J Harrison and Dr J Barclay Baron Honorary and Consulting Surgeons Mr George F Atchley, Mr Nelson C Dobson, Mr Chas F Pickering, and Mr H Greville Kyle Physicians Dr J Michell Clarke (Dean of the Faculty of the Bristol General Hospital) Dr George Parker, and Dr J O Symes Surgeons Mr C A Morton Mr R G Poole Lansdown, Mr J Lacy Firth, and Mr E W Hey Groves Physician Accoucheur Dr W H C Newnham Physician to Department for Diseases of the Skin Dr W Kenneth Wills Physician with Charge of Out patients Dr N Neild Surgeon to the Throat and Nose Mr A J Wright Surgeon to the Ear Mr J Lacy Firth Ophthalmic Surgeon Mr Cyril H Walker Assistant Physician Dr Carey F Coombs Assistant Surgeon Mr C A Moore Assistant Physician Accoucheur, with charge of Out-patients Mr D C Rayner Anæsthetists Dr J Freeman and Dr Hedley Hill Dental Surgeon Mr E A G Dowling Assistant Dental Surgeon Mr H J Wyatt Pathologist Mr G Scott Williamson Assistant Anæsthetists Dr C orfield, Dr W Russell Cooper, and Dr Harold B Logan Curator of Museum Mr G Scott Williamson Electrical Department Dr George Parker, Dr J Ellington Jones. Skiagraphist Dr F G Bergin

Further information as to scholarships, curricula, and fees can be obtained from the Dean of the Faculty of Medicine or the Registrar of the University

---

UNIVERSITY OF WALES

This University has the privilege of granting degrees in Medicine and Diplomas in Public Health At the three constituent Colleges of Aberystwyth Bangor, and Cardiff there are Professors of Chemistry, Botany, Zoology, and Physics, so that the students of the University can obtain proper instruction in the ancillary subjects The foundation of a Medical Faculty has been laid at University College, Cardiff, where there is a recognised school of medicine

University College, Cardiff School of Medicine —All classes are open to both men and women students who may spend three or four out of their five years of medical study at Cardiff The courses of instruction given at Cardiff are recognised as qualifying for the examinations of the Universities, Royal Colleges, and other licensing bodies of Great Britain and Ireland, and they are specially adapted to meet the needs of those University students studying for Cambridge and London degrees Students who are preparing for these examinations may compound for their courses by paying a fee of £63, while a composition fee of £41 10s includes all the necessary courses for the first and second examinations for the Diploma of the Conjoint Board. In all cases the composition fees may be paid by instalments Hospital instruction is given at the King Edward VII 's Hospital, Cardiff. The attention of students about to matriculate is drawn to the numerous entrance scholarships offered for competition at University College, Cardiff, in April next, most of which may be held by medical students Full particulars of the examination for these may be obtained by application to the Registrar In the department of Public Health established in 1899 instruction is given qualifying for the D P H examinations Further information may be obtained from the Dean of the Faculty of Medicine

Lecturers —Physics Professor A L Selby Chemistry Professor C M Thompson Zoology Professor W N Parker Botany Professor A H Trow Anatomy Professor David Hepburn Physiology Professor J B Haycraft Materia Medica and Therapeutics Dr W Mitchell Stevens. Pathology and Bacteriology Professor Emrys Roberts Public Health and Hygienic Chemistry Mr J H Sugden Midwifery Hygiene Dr E Walford and Dr D J Morgan Midwifery (for Midwives) Dr E J Maclean Vaccination Professor Emrys Roberts

Clinical Instruction —King Edward VII 's Hospital, Cardiff —Students can attend the practice of this Hospital, which contains 311 beds 104 beds for military patients Founded 1837 In patients, 2260 , out-patients, 13,604

Staff —Consulting Physician Dr Herbert Vachell. ENGLISH MEDICAL CORPORATIONS GRANTING DIPLOMAS

EXAMINING BOARD IN ENGLAND BY THE ROYAL COLLEGE OF PHYSICIANS OF LONDON AND THE ROYAL COLLEGE OF SURGEONS OF ENGLAND

Under this heading we give the regulations for the examinations enjoined by the Conjoint Examining Board of the Royal Colleges of Physicians of London and Surgeons of England and of the Society of Apothecaries upon students desiring their respective diplomas of qualification We do not give any list of schools recognised by these bodies as eligible to prepare students for their examinations beyond mentioning that all the schools which we have already described (under the heading of the Universities to which they are attached) are recognised as suitable places of instruction by the corporations granting medical diplomas The courses of study at the principal colonial medical schools are also recognised as qualifying for the examinations of these corporations

Any candidate who desires to obtain both the Licence of the Royal College of Physicians of London and the diploma of Member of the Royal College of Surgeons of England is required to complete five years of professional study at recognised Medical Schools and Hospitals and to comply with the following regulations and to pass the examinations hereinafter set forth Six months of the curriculum may be spent in an Institution recognised by the Board for instruction in Chemistry, Physics Practical Chemistry and Biology

Professional Examinations —There are three Examinations, called herein the First Examination, the Second Examination, and the Third or Final Examination, each being partly written, partly oral, and partly practical These examinations will be held in the months of January, April July and September or October unless otherwise appointed Every candidate intending to present himself for examination is required to give notice in writing to Mr F G Hallett, secretary of the Examining Board Examination Hall, Queen square, Bloomsbury W C 14 clear days before the day on which the examination commences, transmitting at the same time the required certificates

The subjects of the *First Examination* are—Chemistry Physics Elementary Biology and Practical Pharmacy A candidate may take this examination in three parts at different times (Chemistry and Physics must be taken together until the required standard is reached in both or in one of these subjects but a candidate will not be allowed to pass in one without obtaining at the same time at least half the number of marks required to pass in the other) A candidate will be admitted to examination in Chemistry and Physics in Practical Pharmacy and Elementary Biology on producing evidence of having passed the required Preliminary Examination and of having received instruction in these subjects at a recognised institution but he may take Pharmacy at any time during the curriculum A candidate rejected in one part or more of the First Examination will not be admitted to re examination until after the lapse of a period of no less than three months from the date of rejection, and he will be re examined in the subject or subjects in which he has been rejected If referred in Chemistry, Physics, or Biology he must produce evidence of further instruction at a recognised institution Any candidate who shall produce satisfactory evidence of having passed an examination for a degree in Medicine on any of the subjects of this examination conducted at a university in the United Kingdom, in India, or in a British colony will be exempt from examination in those subjects in which he has passed

The fees for admission to the *First Examination* are as follows For the whole examination, £10 10s , for re examination after rejection in Parts I and II , £3 3s , and for re-examination in each of the other parts, £2 2s

The subjects of the *Second Examination* are Anatomy and Physiology Candidates will be required to pass in both subjects at one and the same time. Candidates will be admissible to the Second Examination on production of the required certificates of professional study The study of Anatomy and Physiology before passing in two of the first three parts of the First Professional Examination is not recognised

A candidate referred on the *Second Examination* will be required, before being admitted to re examination, to produce a certificate that he has pursued, to the satisfaction of his teachers in a recognised place of study, his Anatomical and Physiological studies during a period of not less than three months subsequently to the date of his reference

The fees for admission to the *Second Examination* are £10 10s for the whole examination and £6 6s for re examination after rejection

The subjects of the *Third* or *Final Examination* are Part I Medicine, including Medical Anatomy, Pathology, Practical Pharmacy, Therapeutics, Forensic Medicine, and Public Health Candidates who have passed in Practical Pharmacy at the First Examination will not be re examined in that subject at the Third Examination Part II Surgery including Pathology, Surgical Anatomy and the use of Surgical Appliances Part III Midwifery and Diseases Peculiar to Women. Candidates may present themselves for Parts I , II , and III of the examination separately or together at the expiration of not less than two years (24 months) from the date of passing the Second Examination on production of the certificates of study required for the respective parts provided that the examination is not completed before the expiration of five years from the date of passing the Preliminary Examination

The fees for admission to the *Third* or *Final Examination* are as follows For the whole examination, £21 Part I For re-examination in Medicine including Medical Anatomy, Pathology Therapeutics, Forensic Medicine and Public Health, £5 5s , for re examination in Practical Pharmacy (if taken at this examination) £2 2s Part II For re examination in Surgery including Pathology, Surgical Anatomy, and the use of Surgical Appliances £5 5s Part III For re examination in Midwifery and Diseases Peculiar to Women, £3 3s

A candidate referred on the *Third* or *Final Examination* will not be admitted to re-examination until after the lapse of a period of not less than three months from the date of rejection and will be required, before being admitted to re examination, to produce a certificate, in regard to Medicine and Surgery of having attended the Medical and Surgical Practice or the Medical or Surgical Practice as the case may be during the period of his reference, and in regard to Midwifery and Diseases Peculiar to Women a certificate of having received, subsequently to the date of his reference, not less than three months' instruction in that subject by a recognised teacher

Students of recognised universities in England, Scotland, and Ireland who have passed examinations for a degree in Medicine at their universities in the subjects of the First and Second Examinations of the Examining Board may enter for the Final Examination at the expiration of two years from the date of passing in Anatomy and Physiology on production of the required certificates

Members of certain recognised Indian Colonial, and Foreign universities who have passed examinations for the Degree of Doctor or Bachelor of Medicine or Surgery in the subjects of the First and Second Examinations of the Examining Board may present themselves for the Final Examination under special conditions which can be ascertained on application to the Secretary

ROYAL COLLEGE OF PHYSICIANS OF LONDON
THE MEMBERSHIP AND FELLOWSHIP

In addition to the diplomas granted by the English Conjoint Board, the Royal College of Physicians of London and the Royal College of Surgeons of England grant honour diplomas, which no longer give the right to practise professionally if held separately The Royal College of Physicians of London has two such diplomas, the *Fellowship* which is a purely honorary distinction and the *Membership* which is obtained by examination

Membership —Every candidate for the Membership of the College must furnish proof of having attained the age of 25 years Candidates must not be engaged in trade, dispense medicine, make any arrangement with a chemist or any other person for the supply of medicine, or practise medicine or surgery in partnership, by deed or otherwise Any candidate being already registered or having passed a qualifying examination in accordance with the Medical Act of 1886, who has obtained the degree of Doctor or Bachelor of Medicine at a University in the United Kingdom in India, or a British colony, or who has obtained a foreign qualification entitling him or her to practise medicine or surgery in the country where such qualification has been conferred wherein the courses of study and the examinations to be undergone previously to graduation have been adjudged by the Censors' Board to be satisfactory, will (if the Censors think fit) be admitted to the Pass Examination The nature and extent of this examination will, in the case of each candidate, be determined by the Censors' Board All other candidates must produce proof of having passed the examinations required for the Licence of the College The examination is directed partly to pathology and partly to the practice of medicine and may be modified in circumstances to be ascertained by application to the Registrar For example, candidates under 40 years of age are examined in an ancient and a modern language, a test from which their seniors are exempt *The fee for admission as a Member of the College* is 40 guineas, except when the candidate for Membership is a Licentiate of the College, in which case the fee already paid for the Licence shall be deducted from the 40 guineas The fee for the examination is £6 6*s*

Fellowship —The *Fellows* are selected annually from the ranks of the *Members* by the Comitia of the College

ROYAL COLLEGE OF SURGEONS OF ENGLAND
THE FELLOWSHIP

The Royal College of Surgeons of England confers its diploma of Fellow upon a few distinguished persons in an honorary capacity Two Members of long standing may also be elected to the Fellowship annually But the bulk of the Fellows obtain the diploma as the result of examination

Fellowship —The examination for the Fellowship is divided into two parts—viz. the First Examination and the Second Examination The subjects of the First Examination are Anatomy and Physiology and the questions on these subjects may require an elementary acquaintance with Comparative Anatomy and Physiology The examination is partly written and partly *vivâ voce* The subjects of the Second Examination are Surgery including Surgical Anatomy and Pathology The examination is partly written and partly *vivâ voce* and includes the examination of patients and the performance of operations on the dead body The examinations are held during the months of May and November of each year

The fees for examination are —First Examination each admission, 5 guineas Second Examination each admission 12 guineas Of such examination fees 17 guineas will be reckoned as part of the fee payable upon admission to the Fellowship The fee to be paid upon admission to the Fellowship is 30 guineas, except when the candidate is a Member of the College in which case the fee is 20 guineas

A Member of the College is admissible to the First Examination at any time after receiving his Diploma of Membership A candidate who is not a member of the College is admissible to the first Professional Examination for the Fellowship on the production of evidence of having passed the First and Second Examinations of the Examining Board in England by the Royal College of Physicians of London and the Royal College of Surgeons of England (or, if a member of a University recognised by the College for the purpose, of having passed the Examinations in his University equivalent to the First and Second Examinations of the Board) and on the production of certificates of attendance upon certain courses of study described in the Regulations

A Member of the College is admissible to the Second Examination at any time after having passed the First Examination, on producing satisfactory evidence of having been engaged not less than six years in the study (or study and practice) of the profession

A candidate who is not a Member of the College must possess the registrable surgical and medical degrees of universities recognised by the Council and must have been engaged in the study (or study and practice) of the profession for not less than four years subsequent to the date of obtaining the recognised qualification, one year of which shall have been spent in attendance on the Surgical Practice of a recognised hospital The diploma of Fellow is not conferred upon successful candidates until they have attained the age of 25 years

The Regulations may be obtained on application to the Director of Examinations Examination Hall, Queen square, Bloomsbury, London, W C

SOCIETY OF APOTHECARIES OF LONDON

There are two examinations—Primary and Final The Final examination is divided into Section I and Section II The Primary examination is held quarterly Final examinations are held monthly No examinations are held in the month of September

The Primary examination consists of two parts Part I Elementary Biology , Chemistry, Chemical Physics, including the Elementary Mechanics of Solids and Fluids, Heat, Light, and Electricity , Practical Chemistry , and Materia Medica and Pharmacy Part II includes Anatomy, Physiology, and Histology This examination cannot be passed before the completion of twelve months' Practical Anatomy with Demonstrations, and these subjects cannot be taken separately except in the event of the candidate having previously passed in one A schedule for the Primary examination, to be obtained of the Secretary, must be signed by the Dean of the Medical School or other authority Section I of the Final examination consists of three parts Part I includes the Principles and Practice of Surgery, Surgical Pathology and Surgical Anatomy, Operative Manipulation, Instruments and Appliances Part II. includes the Principles and Practice of Medicine, Pharmacology, Pathology and Morbid Histology , Forensic Medicine, Hygiene, Theory and Practice of Vaccination, and Mental Diseases Part III includes Midwifery, Gynæcology and Diseases of New born Children and the Use of Obstetric Instruments and Appliances Section I of the Final examination cannot be passed before the expiration of 45 months from the date of commencement of medical study, during which time not less than three winter sessions and two summer sessions must have been passed at one or more of the medical schools connected with a general hospital recognised by the Society Section II of the Final examination consists of two Parts Part I Clinical Surgery , Part II Clinical Medicine and Medical Anatomy Section II cannot be passed before the end of the fifth year

The course of study for the *Primary examination* is as follows —Elementary Biology, not less than three months, Chemistry and Chemical Physics six months, Practical Chemistry, three months, Pharmacy and Dispensing, three months, Anatomy six months, Practical Anatomy with Demonstrations, 12 months, Physiology, six months, Histology with Demonstrations, three months. The study of these subjects must be pursued at a Medical School recognised by the Society Instruction in Pharmacy and Dispensing must be given by a registered medical practitioner or by a member of the Pharmaceutical Society by examination or in a public hospital, infirmary, or dispensary

The course of study for the *Final examination Section I*, includes attendance on the Surgical and Medical Practice (with Post-mortem Examinations) at a hospital connected with a medical school for a period of one winter and one summer session , lectures on the Principles and Practice of Surgery six months , *Practical Surgery*, three months , Clinical Surgical Lectures nine months , Dressership six months, Performance of Surgical Operations on the Dead Body, Lectures on Principles and Practice of Medicine, six months, Pathology, three months, Clinical Medical Lectures nine months, Clinical Clerkship six months, Forensic Medicine Hygiene and Insanity three months, Midwifery and Gynæcology, three months, Clinical Instruction in the same, three months, a course of Practical Midwifery, attendance on 20 Midwifery cases. The course of medical study must extend over the above-mentioned period of 45 months and the offices of dresser or clinical clerk must be held at a hospital or other institution recognised by the Society

The course of study for the *Final examination Section II.*, includes either attendance on the Practice of Medicine and Surgery at a hospital or other institution recognised by the Society for a further period of 12 months, or six months as above and six months as a pupil of a registered practitioner holding a public medical or surgical appointment or attendance at two special hospitals for six months (three months at each hospital) and for six months at a general hospital, all such hospitals to be recognised by the Society Evidence shall also be given of practical instruction in Infectious Diseases and in Mental Diseases (at a lunatic asylum or in the wards of an institution containing a special ward set apart for the treatment of mental diseases) and in any two of the following subjects Ophthalmic Surgery Laryngology with Rhinology and Otology, Dermatology, and Diseases of Children No candidate is eligible for the Final examination who has not completed the curriculum prescribed by the Society, in evidence of which a schedule, to be obtained of the Secretary must be produced signed by the Dean of the Medical School or other authority Prior to Section II of the Final examination the candidate must produce certificates (1) of being 21 years of age, (2) of moral character, (3) of the course of medical study, (4) of proficiency in vaccination signed by a teacher authorised by the Local Government Board, and (5) of instruction in the administration of anæsthetics Candidates intending to present themselves for examination are required to give 14 days' notice A form for this purpose will be sent on application

Licentiates are eligible for the Membership of the Society of Apothecaries Particulars may be obtained on application to the clerk.

The fee for the Licence is 20 guineas Female candidates are admitted to examinations. The examination offices are open from 10 A M to 4 P M on Saturdays from 10 A.M to 1 P M All letters should be addressed to the Secretary Court of Examiners Society of Apothecaries of London, Blackfriars E C

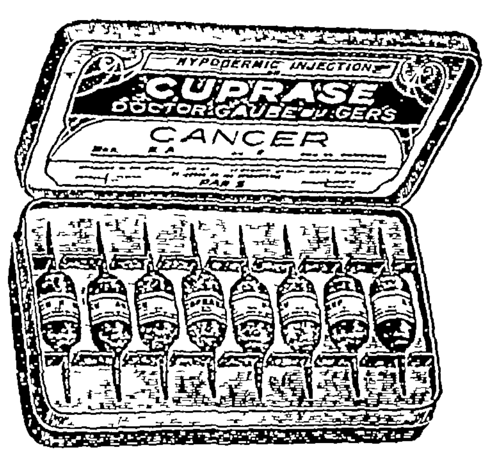
For the Medical Treatment of CANCER.

Extract from Proceedings of the Royal Society of Medicine February 1913 —

DR GEORGE HERSCHELL comparing electric and chemical colloid copper stated Chemical colloid appears to give the best results In the following cases chemically prepared colloid was used Experimentally it has been proved: (1) That *particles of colloid* copper can be demonstrated in the granulations of cancerous growths after two or three injections of the colloid and clinically (2) There is invariably great relief from pain (3) Appetite and strength return and the patient puts on flesh (4) There is in many cases a diminution in the size of the tumour (5) The injections are absolutely non-toxic although in many *cases* an inflammatory *reaction is manifested* in the cancerous growths

As regards my own personal experi*ence in the use of this method of treat*ment in addition to my own cases I have had an opportunity of observing the effects in the practice of some of my medical friends, and in nearly all cases the progress of the disease appeared to be arrested



CUPRASE is a Colloidal Copper hydroxide which is obtained chemically by the reduction of Salts of Copper in the presence of Albumosic Acid

The numerous clinical reports from Doctors of repute in *various countries* give *cases* of a great variety In all of these **pain has been eliminated,** and in a good percentage cures are **claimed,** and in no instance **any undesirable effects.**

Its easy application (subcutaneous injections) places it within the reach of all practitioners It is not toxic

WARWICKSHIRE, July 1st, 1917

DEAR SIRS —Will you please send me another box of Cuprase ampoules The previous lot effected a most remarkable cure in an elderly lady suffering from cervical cancer—the cauliflower-like growth has disappeared with its offensive discharge

This case was given three months life by a Specialist, being inoperable

Yours faithfully
(Signed) G—— B—— M R C S L R C P

Disappearance of the Pain.

Return of Sleep

Increase of the Appetite,

Colour and Strength.

RATIONAL TREATMENT OF CONSTIPATION

By the double action of secretions and peristalsis

OPOLAXYL

Opolaxyl is a combination of the secretions of the liver (biliary), pancreas, and intestines with vegetable extracts of a non drastic nature

It combines all the secretions to correspond to nature's therapy and promotes a flow of bile and glycogen with their hematopoietic and antitoxic properties

It is a normal regulator of the gastro intestinal functions, consequently it improves the metabolic exchanges of the entire organism

Opolaxyl does not lose its efficacy by prolonged use, its effect is gentle and constant, without the least irritation

It is not merely a purgative, it stimulates the *defective* organs and revives the normal equilibrium, it has a lasting effect by reason of it rebuilding the organs, thus correcting diminutional function

OPOLAXYL is put up in small size tabular form and should be swallowed without crunching, at bedtime or *before* breakfast DOSE —For obstinate constipation 2 or 3 tablets, afterwards 1 tablet every 3 or 4 days for a month.

School of the Pharmaceutical Society of Great Britain —The subjects of the Minor examination of the Pharmaceutical Society (for registration as "chemist and druggist") are botany, chemistry and physics, practical chemistry materia medica pharmacy, practical pharmacy and dispensing, and prescription reading Fee, 10 guineas, for each subsequent examination after failure, 3 guineas The advanced or Major examination (for registration as "pharmaceutical chemist") includes botany, chemistry and physics practical chemistry, and materia medica Fee, 3 guineas Lecturers —Chemistry and Physics Professor Henry L Smith, B Sc, F I C Botany, Mr J Small M Sc Lond Pharmaceutics Professor Greenish, F I C, F L S The inaugural address will be delivered on Wednesday Oct 3rd Medical students are admitted to the lectures and laboratory work in any or all the courses Certificates of instruction in this school are received by the Conjoint Board of the Royal Colleges and by the University of London Application for admission to the school, or for further information, may be made to the Dean Professor Greenish, 17, Bloomsbury square, London, W C

II.—SCOTLAND

THE UNIVERSITIES

UNIVERSITY OF EDINBURGH

Four Degrees in Medicine and Surgery are conferred by the University of Edinburgh—viz , Bachelor of Medicine (M B) Bachelor of Surgery (Ch B), Doctor of Medicine (M D), and Master of Surgery (Ch M) The degree of Bachelor of Surgery cannot be conferred on any person who does not at the same time obtain the degree of Bachelor of Medicine, and similarly the degree of Bachelor of Medicine is not conferred on any person who does not at the same time obtain the degree of Bachelor of Surgery

No one is admitted to the degrees of *Bachelor of Medicine* and *Bachelor of Surgery* who has not been engaged in Medical and Surgical study for five years No course of lectures will be allowed to qualify unless the lecturer certifies that it has embraced at least 100 lectures, or 50 lectures, as may be required by the regulations, and that the student has also duly performed the work of the class

Candidates for the degrees of M B and Ch B must have attended for at least three academic years the medical and surgical practice either of the Royal Infirmary, Edinburgh, or of a general hospital elsewhere which accommodates not fewer than 80 patients and possesses a distinct staff of physicians and surgeons They must have attended Clinical Surgery during a course or courses extending over not less than nine months, and courses of instruction in all the subsidiary subjects They must have personally conducted, under the superintendence of a registered medical practitioner, 20 cases of labour at least

With respect to the places and institutions at which the studies of the candidate may be prosecuted the following regulations have effect —Two of the five years of medical study must be spent in the University of Edinburgh The remaining three years may be spent in any University of the United Kingdom, or in any Indian, Colonial, or Foreign university recognised for the purpose by the University Court, or in such medical schools or under such teachers as may be recognised for the purpose by the University Court Of the subjects of study—viz , Anatomy, Practical Anatomy, Chemistry, *Practical Chemistry* Materia Medica, Physiology, Practical Physiology, Practice of Medicine, Surgery Midwifery and Diseases of Women, Pathology, Practical Pathology Physics, Botany, Zoology Medical Jurisprudence, and Public Health—not less than one half must be taken in the University of Edinburgh, which corresponds to the two years above referred to

Women are admitted to graduation in medicine under practically the same conditions as men

The fee to be paid for the degrees of Bachelor of Medicine and Bachelor of Surgery is £23 2*s* , and the proportion of this sum to be paid by a candidate at each division of the examination shall be as follows—viz For the First Division of the Examination (Botany, Zoology, Physics and Chemistry) £6 6*s* , for the Second Division (Anatomy and Physiology), £5 5*s* , for the Third Division (Pathology and Materia Medica and Therapeutics) £4 4*s* , and for the Final Division (Surgery and Clinical Surgery Medicine and Clinical Medicine, Midwifery, Clinical Gynæcology, and Forensic Medicine and Public Health) £7 7*s*

Bachelors of Medicine and *Bachelors of Surgery* may proceed to the degrees of *Doctor of Medicine* and *Master of Surgery* after they have spent one year in the medical or surgical wards respectively of a hospital, or the Military or Naval Medical Services, or in scientific work bearing directly on their profession, or two years in practice In each case an examination must be passed and a thesis submitted for approval of the Faculty The fee to be paid for the degree of M D is £15 15*s* and the fee to be paid for the degree of Ch M is £15 15*s*

A diploma in Tropical Medicine and Hygiene (D T M. and H) is granted to graduates in Medicine and Surgery of the University of not less than six months standing and to Registered Medical Practitioners who, having resided in a tropical country, may be approved by the Senatus, on the recommendation of the Faculty of Medicine

Diploma in Psychiatry —Courses of instruction have also been instituted for a Diploma in Psychiatry, open to all legally qualified Medical Practitioners who conform with the Regulations There shall be two examinations for the Diploma, the first comprising the subjects of Anatomy of the Nervous System , Physiology, Histology and Chemistry of the Nervous System , Pathology of the Brain and Nervous System , and Practical Bacteriology in its relation to Mental Diseases , and the second examination comprising the subjects of Psychology with Experimental Psychology, Clinical Neurology, and Psychiatry (systematic and clinical). *The fee for each examination shall be £5 5s*

Professors—Chemistry James Walker, D Sc , F R S Zoology J Cossar Ewart, M D Botany I Bayley Balfour M D Physiology Sir E A. Schäfer F R S Anatomy Arthur Robinson, M D Pathology James Lorrain Smith, M D Bacteriology James Ritchie M D Materia Medica Sir Thomas R Fraser, M D F R S Forensic Medicine *Harvey Littlejohn M B F R C S E* Public Health C Hunter Stewart, M B , D Sc Midwifery Sir John Halliday Croom M D Surgery Alexis Thomson, F R C S E Medicine Geo Lovell Gulland, M D Clinical Surgery F M Caird M B , F R C S Clinical Medicine Sir Thomas R Fraser, M D William Russell, M D , and Geo Lovell Gulland, M D

The University of Edinburgh ~~is especially rich in~~ scholarships and prizes in medical subjects Full particulars can be obtained from the Dean of the Medical Faculty

SCHOOL OF MEDICINE OF THE ROYAL COLLEGES, Edinburgh —The number of students varies much in the classes and subjects It is within the limit to say that before the war about 1000 students availed themselves each session of the opportunity of attending the school The lectures qualify for the University of Edinburgh and other Universities, the Royal Colleges of Physicians and Surgeons of London Edinburgh, and Dublin, the Faculty of Physicians and Surgeons of Glasgow, and other Medical and Surgical and Public Boards

The anatomy rooms and laboratories will open and the lectures commence on Oct 9th

In accordance with the statutes of the University of Edinburgh one half of the qualifying classes required for graduation may be attended in this school The regulations require that the fee for any class taken for graduation in Edinburgh shall be the same as that for the corresponding class in the University The whole education required for graduation at the University of London may be taken in this school

The appointment of Resident Physician to the wards in the Royal Infirmary under the care of the Ordinary Physicians is open to those members of their clinical class who have held the office of clerk in their wards for at least six months Six Residentships are appointed for a period of six months each. Resident Surgeons are also appointed by the Ordinary Surgeons to the Hospital In all respects the students are taught under regulations similar to those at the University of Edinburgh and the other Universities of Scotland and they receive similar certificates at the close of each session The courses on *special non qualifying* subjects have for the last quarter of a century formed a marked feature of the school Indeed, such medical subjects could be studied in Edinburgh only in this school until lately, when the University of Edinburgh appointed from the school lecturers on Diseases of the Eye Insanity, and Diseases of Children to take charge of classes intra murally A list of the classes and lecturers will be found below Special courses of instruction for dental students and for women are also included in the curriculum of this school

Lecturers and Fees —Winter Session Anatomy Practical Anatomy, and Demonstrations, Dr Ryland Whitaker, Chemistry (Practical, &c.), Mr Gemmell and Dr T W Drinkwater , Physiology (Institutes of Medicine) Dr Alex. Goodall , General Pathology, &c Dr James Miller and Mr C R Whittaker , Zoology Mr H. Miller , Physics Dr Dawson Turner and Mr A. McKendrick , Meteorology Dr Dawson Turner and Mr A. McKendrick , Bacteriology, Dr Taylor Grant and Dr James Miller , Practice of Physic Dr R A Fleming Dr E Bramwell, and Dr A Dingwall Fordyce , Surgery, Mr Scot Skirving, Mr Chiene, Mr H Wade, Mr J W Struthers, Mr W J Stuart, and Mr L Beesly , Materia Medica, &c Dr Craig and Dr J Orr , Midwifery &c , Dr Hart, Dr Ballantyne, Dr Haig Ferguson, Dr Elsie Inglis Dr McGibbon, Dr Barbour Simpson, and Dr Davidson , Medical Jurisprudence, &c

Dr Aitchison Robertson, Public Health, Dr W Robertson, Hospital Practice (Edinburgh Royal Infirmary) Physicians, Sir R. W Philip Dr Graham Brown Dr F D Boyd, Dr R. A Fleming, and Dr Brewis for Gynæcology, Surgeons, Mr Hodsdon Mr Wallace Mr Miles and Mr Dowden, Clinical Medicine Sir R W Philip, Dr Graham Brown, Dr F D Boyd Dr R A Fleming, and Dr Brewis for Gynæcology, Clinical Surgery Mr Cathcart, Mr Hodsdon Mr Wallace, Mr Miles and Mr Dowden, Tuberculosis, Sir R W Philip (Clinical), Dr Miller (Pathological), Vaccination, Dr W G A Robertson and Dr Wm D D Small, Diseases of Ear Nose, and Throat Dr J Malcolm Farquharson and Dr J S Fraser, Diseases of the Eye, Dr J V Paterson, Ophthalmoscopy, Dr A. EYE EAR AND THROAT INFIRMARY OF EDINBURGH 6 Cambridge street, Lothian road —Clinical Lectures and Instruction are given in this institution, which is open at 1 o clock daily for outdoor patients for Eye Diseases, Mondays Thursdays, and Saturdays at 12 noon and Tuesdays and Fridays at 4 P M for outdoor Ear, Nose, and

Throat Patients Special Practical Ophthalmoscopic Classes by arrangement Patients whose diseases require operations or more than ordinary care are accommodated in the house Consulting Surgeon Dr Logan Turner (Ear, Nose, and Throat Department) Surgeons Dr William George Sym, Dr J V Paterson Dr E M Lithgow, Dr W T Gardiner, Dr John M Darling and Dr Ernest H Cameron Honorary Anæsthetist Mr J H Gibbs Dental Surgeon Mr G W Watson Treasurer and Secretary Mr J P Watson, W S , 32, Charlotte square

---

UNIVERSITY OF GLASGOW

The University of Glasgow is both a teaching and a *degree-granting* body, but admits to graduation only candidates whose preliminary examination and course of study conform to its own regulations Within certain limits instruction given by recognised medical schools and teachers may be accepted, but not less than one-half of the subjects other than clinical must be taken in this or some other recognised university, and at least two years of the course must be taken in Glasgow University Six degrees, open both to men and women, are conferred M B and Ch B (always conjointly), M D and Ch M , B Sc in Public Health , D Sc in Public Health , and B Sc in Pharmacy A Preliminary Examination must be passed in (1) English, (2) Latin, (3) Elementary Mathematics, and (4) Greek, or French, or German, or Italian, with possible options to students whose native language is not English Candidates taking the University preliminary examination are not obliged to pass in all the four subjects at one examination, but must do so at not more than two occasions

For the degrees of M B and Ch B a curriculum of five years is required The candidate must during his curriculum, have attended a course or courses of instruction in each of the following subjects of study, extending over not less than the number of terms specified in each case and including such class examinations as may be prescribed in connection with the several courses —*Chemistry* (including Organic Chemistry), two terms , with Practical Chemistry one term , Physics (with practical work), one term , Botany (with practical work), one term , Zoology (with practical work), one term , Anatomy and Practical Anatomy five terms , *Physiology and Practical Physiology, three terms* , Materia Medica and Therapeutics (together or separately) each subject, one term , Pathology and Practical Pathology, three terms , Medical Jurisprudence and Public Health (together or separately), each subject, one term , Midwifery and *Diseases peculiar to Women and to Infants*, two terms , Surgery two terms , Medicine, two terms Candidates must attend at least three years the Medical and Surgical Practice of a recognised hospital accommodating at least 80 patients and having a distinct staff of physicians and surgeons At *least nine months hospital* attendance is required on both Clinical Surgery and Clinical Medicine, and the student must have acted for six months as clerk in medical and dresser in surgical wards, and must have had six months outdoor practice , he must also have attended a course of Mental Diseases and of Practical Pharmacy (25 meetings), must have been properly instructed in Vaccination at a public vaccination station, and must have attended at least 20 cases of labour and the Practice of a Lying in Hospital The University also requires further study in various special subjects

There are four Professional Examinations, the first comprising Botany, Zoology, Physics and Chemistry , the second comprising Anatomy and Physiology , the third comprising Materia Medica and Therapeutics and Pathology , and the fourth or final, comprising Medical Jurisprudence and Public Health Surgery and Clinical Surgery, Practice of Medicine and Clinical Medicine, and Midwifery and the Diseases peculiar to Women and to Infants

The degrees of M D (Doctor of Medicine) and Ch M (Master of Surgery) are higher degrees in Medicine and Surgery respectively, and candidates (not under 24 years of age) who have previously obtained the double bachelorship may be admitted to either M D or Ch.M on completing the after course prescribed, including an examination in Clinical Medicine for M D and an examination in Surgical Anatomy operations on the dead body, and Clinical

Fees —The Fees for M B and Ch B are £23 2*s* The class fee in each subject of the curriculum for M B and Ch B is £2 2*s* , £3 3*s* , or £4 4*s* , and the present fees for hospital attendance are £10 10*s* The fee for M D is £15 15*s* , and for Ch M £15 15*s*

The great majority of the students take their hospital course at the Western Infirmary, or the Royal Infirmary, where clinical instruction is given by professors of the University and others Clinical instruction on Fevers is given at Ruchill and Belvidere Hospitals, while special courses, largely of a practical nature and embracing work in Hospital or Asylum wards are conducted by University Lecturers on the Ear, the Throat and Nose, Dermatology, Ophthalmology, Venereal *Diseases*, and *Insanity* Queen Margaret College, sometime conducted as a separate institution for the higher education of women, was made over to the University in 1892, and in it medical classes for women are conducted under University professors and other lecturers appointed by *the University Court*, whilst for clinical instruction female students are admitted to the Royal Infirmary

Professors—Natural Philosophy A Gray LL.D , F R.S. Materia Medica Ralph Stockman, M D Chemistry (Vacant) Surgery Sir William ~~Macewen, M D~~ , F R S , and Robert Kennedy, M D , D Sc Practice of Medicine T K Monro, M D , and W K Hunter, M D , D Sc. Midwifery Murdoch Cameron, M D , and J M Munro Kerr, M D Anatomy Thomas H Bryce, M D Zoology John Graham Kerr, F R S Botany F O Bower, D Sc., F R S Physiology D Noël Paton B Sc M D , F R.S. *Forensic Medicine John Glaister, M D Pathology* Robert Muir, M D , F R S , and J H Teacher M D

In this University Bursaries and Prizes to the annual amount of over £1000 are appropriated to students in the Medical Faculty, and there are also several Scholarships and Fellowships which may be held by medical students who have gone through the Arts course A full list will be found in the University Calendar

THE ANDERSON COLLEGE OF MEDICINE, Dumbarton road, Glasgow, W —The following courses are given, which *qualify for all the licensing boards and for the* Universities of London, Durham, Edinburgh, and Glasgow (the latter two under certain conditions) —In winter Anatomy and Practical Anatomy (Vacant) , Physics, Prof P Bennett, Chemistry, Prof J R Watson , Botany, Prof. B. G *Cormack , Zoology Prof* W F Mackenzie , Physiology Prof H Morton , Materia Medica, Prof J P Duncan, Midwifery and Diseases of Children, Prof Wm D Macfarlane , Surgery Prof Arch Young , Practice of Medicine, Prof J M Cowan , Ophthalmic Medicine and Surgery, Prof A J Ballantyne , Aural Surgery, Prof. J G Connal , Diseases of Throat and Nose, Prof. John Macintyre , Public Health (Laboratory Course) Prof C C Douglas , Dermatology, Prof J G Tomkinson , Dental Bacteriology, Prof C C *Douglas* , Dental Surgery and Pathology Dr J Watt , Dental Anatomy and Physiology, Dr W Wallace , Dental Metallurgy Dr Charles Read. In summer Anatomy Practical Anatomy, and Osteology , Practical Chemistry , Botany and Practical Botany , Zoology and *Practical* Zoology , Practical Physiology , Practical Materia Medica and Pharmacy , Medical Jurisprudence (*Prof C C* Douglas), Diseases of Women (Prof Wm D Macfarlane), Operative Surgery , Ophthalmic Medicine and Surgery , Aural Surgery , Mental Diseases (Dr Ivy Mackenzie), and Public Health (Lecture Course and Laboratory Course). Candidates for the Licence in Dental Surgery can obtain the full medical curriculum in Anatomy, Chemistry, Physiology, Surgery, Practice of Medicine, and Materia Medica The courses special to Dentistry are also conducted in the Anderson College of Medicine

The buildings are situated in Dumbarton road, immediately to the west of the entrance to the Western Infirmary, and adjoining the University Extensive accommodation is provided for Practical Anatomy Practical Chemistry, Practical Botany, Practical Zoology, Practical Physiology, Practical Pharmacy, Operative Surgery and Public Health Ample provision has also been made for the comfort of students

Women students are admitted on the same terms as men

The Carnegie Trust extends its benefactions to students of the Anderson College of Medicine Full particulars may be obtained from Sir W S McCormick, the Carnegie Trust Offices, Merchants Hall, Edinburgh

Communications relating to the College to be addressed to the Secretary of the Medical Faculty The Anderson College of Medicine, Glasgow W Communications relating to the Preliminary Examination in General Education to be addressed to Mr Hugh Cameron, M A, F E I S Educational Institute Office, 34 North Bridge street Edinburgh Communications relating to the Triple Qualification to be addressed to Mr Alexander Duncan, B A, LL.D, Royal Faculty Hall, 242, St Vincent-street, Glasgow

The Winter Session will open on Monday Oct 15th, 1917, and will close on Thursday March 21st, 1918

The Summer Session will open on Wednesday April 24th, 1918, and will close on Wednesday, July 3rd, 1918

ST MUNGO S COLLEGE AND GLASGOW ROYAL INFIRMARY —The classes in St Mungo s College qualify for the English, Scotch, and Irish Conjoint Boards and, under certain conditions, for the various universities, including the University of London Students who have fulfilled the conditions of the Carnegie Trust as regards Scottish birth or extraction age (16 years) and Preliminary Examination are eligible for the benefits of this Trust during the whole course of their studies at St Mungo's College The classes are open to male and female students equally The minimum fees for all the lectures including hospital attendance necessary for candidates for the Diplomas of the English or Scotch Colleges of Physicians and Surgeons, amount to £65 Further particulars can be obtained from a syllabus which may be procured free on application to the Secretary of the Medical Faculty, 86, Castle street, Glasgow

GLASGOW WESTERN MEDICAL SCHOOL —This School has been closed during the war

QUEEN MARGARET COLLEGE, University of Glasgow (Women's Department of the University) —The classes are taught by professors of the University and other lecturers appointed by the University Court, and it is governed by the University Court and Senate The curriculum, regulations, and fees are the same as those of the male students, and the University degrees are open to women on the same conditions as to men They have access to the University Museum and can borrow books from the University Library, besides having a library of reference in Queen Margaret College The School of Medicine is a special feature of the College, and gives full preparation for the medical degrees of the University In July 1894 for the first time in the history of any Scottish University women students graduated in medicine in Glasgow University 234 women have now taken the degree of M B C M or M B, Ch.B of the University of Glasgow and 23 the degree of M D The women students attend classes in the various University Buildings at Gilmore hill Queen Margaret College and the Royal Infirmary Owing to the increase in the number of women medical students additional accommodation for session 1917–18 is provided for the classes of Chemistry and Anatomy in Queen Margaret College Excellent facilities for clinical work are given in the Royal Infirmary in the Maternity and other hospitals The Arthur Scholarship is open every third year to students of first year, other Bursaries are open in Arts and Medicine, and by an ordinance of the Universities Commissioners women are admitted to certain University bursaries, scholarships, and fellowships There is a house of residence for the students of the College coming from a distance The Winter Session will open on Oct 15th

ROYAL INFIRMARY Glasgow —The ancient connexion between the University of Glasgow and the Royal Infirmary was revived in 1911 when four University Chairs and several University Lectureships were established at the infirmary St Mungo s College is situated in the infirmary grounds The infirmary has including the Ophthalmic Department 835 beds There are special beds and wards for diseases of women of the throat, nose and ear, skin venereal diseases burns and septic cases The wards are open to Women Students At the Out-door Department the attendances in 1916 numbered over 137 000 In addition to the large medical and surgical departments there are departments for special diseases—viz diseases of women of the throat and nose, of the ear of the eye of the skin and of the teeth. Five house physicians and 12 house surgeons having a legal qualification in medicine and surgery, who board in the hospital free of charge, are appointed every six months Clerks and dressers are appointed by the physicians and surgeons As a large number of cases of acute diseases and accidents of a varied character are received these appointments are very valuable and desirable There is a modern and fully equipped Electrical Pavilion, and year by year the latest and most approved apparatus for diagnosis and treatment has been added The fees are as follows (*a*) For hospital practice, including attendance at the out door department at the pathological department, post-mortem examinations, and the use of the museum Perpetual ticket, £7, six months, £2 2*s*, three months, £1 1*s*; separate payments amounting to £7 7*s* entitle the student to a perpetual ticket, on return of previous season tickets, (*b*) for Clinical Lectures, six months, £3 10*s*, three months, £1 15*s*, (*c*) Vaccination £1 1*s*, Pathology, £4 4*s*, Bacteriology, £2 2*s*

For further particulars and details as to scholarships and bursaries application should be made to Professor Kynoch, Dean of the Medical Faculty, University College, Dundee

UNIVERSITY COLLEGE Dundee —This *College is one of* the constituent colleges of the University of St Andrews. In the medical buildings there are spacious and well-equipped laboratories The complete medical curriculum can be taken in Dundee For classes, *fees, &c., see under* University of St Andrews

ROYAL INFIRMARY, Dundee —The Infirmary contains 408 beds including special wards for the Diseases of Women, Children, Eye, Ear, and Throat, Skin and for Obstetric cases There is in addition an Extern Obstetric Department. There were during last year 13 660 out-patients and 455 home (maternity) patients The Royal Infirmary offers exceptional facilities for practical work to students Appointments Six qualified Resident Medical Officers (Male or Female) are appointed every six months and one non resident Obstetric Assistant. Clinical Clerks and Dressers are attached to the Physicians and Surgeons and students are appointed as assistants in the Pathological Department. There are in connexion with the clinical courses Tutorial Classes in Medicine and Surgery Instruction is also given in Practical Pharmacy and Materia Medica and in Practical Dentistry Further information can be obtained from Dr Fraser, Medical Superintendent

UNIVERSITY OF ABERDEEN

The University of Aberdeen grants four degrees in Medicine and Surgery—viz , Doctor of Medicine (M D), Master of Surgery (Ch M), Bachelor of Medicine (M B) and Bachelor of Surgery (Ch B). The two degrees of M B and Ch B are not conferred separately, and the higher degrees of M.D and Ch M are only granted to holders of the M B and Ch B degrees

Degrees of M B and Ch B —Before commencing his medical studies each student must pass a Preliminary Examination in (1) English (2) Latin, (3) Mathematics, and (4) Greek, or French, or German The curriculum for the degrees extends over a *period of five years* during which attendance is required in the following subjects Botany, Zoology, Physics, Chemistry (Systematic and Practical) Anatomy (Systematic and Practical), Physiology (Systematic and Practical) Materia Medica and Therapeutics Practical Pharmacy Pathology (Systematic and Practical) Medical Jurisprudence Public Health Surgery, Medicine, and Midwifery

Candidates must attend for at least three years the medical and surgical practice of a recognised hospital, they must have attended courses of at least nine months in clinical medicine and clinical surgery, and have acted as clerk in the medical and dresser in the surgical wards of a hospital Attendance is required on the practice of a dispensary or the out practice of a hospital and also on courses in Mental Diseases, Fevers, Ophthalmology, Post-mortem examinations, and other special subjects The candidate is also required to have been properly instructed in Vaccination and to have attended at least 20 Midwifery cases

The fee for the degrees of M B and Ch B amounts to £23 2*s*

Besides the Royal Infirmary (270 beds), students have the opportunity of attending the following institutions City Fever Hospital, Sick Children s Hospital, General Dispensary, and Lying in and Vaccine Institutions, Royal Lunatic Asylum, Ophthalmic Institution &c

Degrees of M D and Ch M—Candidates for either of these degrees must already hold the degrees of M B and Ch B of Aberdeen A thesis has to be presented and an examination has to be passed in Clinical Medicine (or in some special Department of Medical Science) or Clinical Surgery, as the case may be

A diploma in Public Health is granted by the University to graduates in Medicine of a University in the United Kingdom, after a special examination

Application for further information should be addressed to the Secretary of the Medical Faculty

Professors—Physics C Niven D Sc., F R S Physiology J A MacWilliam, M D Medicine Ashley W Mackintosh M D Chemistry Fred Soddy, F R S Anatomy R W Reid, M D, F R C S Surgery John Marnoch M B, C M Materia Medica J T Cash, M D, LL D, F R S Midwifery Robert G McKerron, M D Forensic Medicine Matthew Hay, M D, LL D Botany J W H Trail M D, F R S Pathology Theodore Shennan, M D Natural History J Arthur Thomson, M A, LL D

Scholarships and Prizes—In the Faculty of Medicine of the University of Aberdeen there are the following Bursaries, Scholarships, and Prizes —Bursaries about 15 Bursaries (competition and presentation) are open each year, of £15 to £30 per annum in value, most of them being tenable for three years, certain other Bursaries are not confined to the Faculty of Medicine, but may be held by Arts Students Scholarships five Post-Graduate Scholarships value £36 to £160 per annum Prizes and Medals 13 Gold Medals and Prizes for proficiency in special departments, &c

Clinical Instruction is given in the Aberdeen Royal Infirmary (270 beds) by the physicians and surgeon to the staff, many of whom are in the list of professors and other lecturers and demonstrators

Aberdeen Royal Asylum—Contains, with hospital attached to main institution and agricultural branch, about 986 beds Medical Superintendent Dr William Reid. Assistant Physician Dr A W H Cheyne Clerk and Treasurer, Mr A Scott Finnie, 343, Union street, Aberdeen Clinical instruction is given to students during three months in summer

---

The London Inter Collegiate Scholarship Board—The awards of certain scholarships in connexion with King's College King's College Medical School, the London (Royal Free Hospital) School of Medicine for Women, University College, and Westminster Hospital Medical Schools were announced in The Lancet of August 18th p 264 The London Inter Collegiate Scholarships Board was constituted in 1904, with the approval of the Governing Bodies of University College, King's College, and the East London College, for the purpose of holding a combined annual examination for entrance scholarships and exhibitions tenable at those colleges and at such other "schools' of the University of London as may agree to make use of the organisation of the Board The examination may also be made use of by other bodies for the award of scholarships and exhibitions, subject to arrangement with the Board Particulars of the examinations held under the auspices of the Board may be obtained from the secretaries or deans of the schools concerned, and copies of papers set at the Board's examinations may be had on application to the Secretary of the Board, King's College, Strand, price 6*d* (or 7*d* post free) each set

---

SCOTTISH MEDICAL CORPORATIONS GRANTING DIPLOMAS

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH ROYAL COLLEGE OF SURGEONS OF EDINBURGH, ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW

These Colleges have made arrangements by which, after one series of examinations, held in Edinburgh or Glasgow, or both, the student may obtain the diplomas of the three Bodies

The three Bodies grant their Single Licences only to candidates who already possess legal qualifications in Medicine or Surgery Copies of the Regulations for the Single Licence of any of the Bodies may be had on application to the respective secretaries

Professional Education—The candidate must produce certificates or other satisfactory evidence of having attended the following separate and distinct courses of instruction Physics, three months, Elementary Biology, three months, Chemistry six months, Practical or Analytical Chemistry, three months, Anatomy, during at least six months, Practical Anatomy, twelve months, Physiology six months, Practical Physiology, three months, Materia Medica, three months, Pathology (including Practical Pathology), nine months, Practice of Medicine, six months, Clinical Medicine, nine months, Principles and Practice of Surgery, six months, Clinical Surgery, nine months, Midwifery, three months, Gynæcology one course of not less than 13 meetings, Diseases of Children, one course of not less than 13 meetings Medical Jurisprudence and Public Health, three months The certified attendance on lectures, demonstrations, and practical work must not be less than three-fourths of the total number of roll calls Every student undergoes a course of Practical Midwifery, but before attending at labours he is required to attend a course of lectures on Surgery and Midwifery and to hold the offices of Clinical Medical Clerk and Surgical Dresser He must also attend for two and a half months instruction in Practical Pharmacy, the certificate to be signed by the teacher, who must be a member of the Pharmaceutical Society of Great Britain, or the superintendent of the laboratory of a public hospital or dispensary, or a registered practitioner who dispenses medicines to his patients, or a teacher of a class of Practical Pharmacy

The student must attend for 27 months the Medical and Surgical practice of a public general hospital containing on an average at least 80 patients available for clinical instruction and possessing distinct staffs of physicians and of surgeons He must act as Surgical Dresser and Medical Clinical Clerk for not less than six months in the wards in each case and receive practical instruction in administration of anæsthetics He must attend for six months the practice of a public dispensary especially recognised by any of the above authorities, or the out-patient practice of a recognised general hospital or act for six months as pupil to a registered practitioner who either holds such a public appointment, or has such opportunities of imparting practical knowledge as shall be satisfactory to the coöperating authorities, this attendance should be made after the student has passed the First and Second examinations

Candidates are also required to attend the following courses Diseases and Injuries of the Eye, three months, Insanity, three months, Infectious Diseases three months, Gynæcology, three months, Diseases of Children, three months

The curriculum lasts for five years, the fifth year being devoted to clinical work.

There are four professional examinations —

First Examination includes Physics, Chemistry, and Elementary Biology

Second Examination includes Anatomy and Physiology and Histology, and candidates may be admitted to this examination at the end of the second year of medical study

Third Examination includes Pathology and Materia Medica with Pharmacology

Final Examination—The Final examination shall not be taken earlier than the end of the fifth year of study and shall embrace the following subjects —Medicine, including Thera peutics, Medical Anatomy, and Clinical Medicine, Surgery, including Surgical Anatomy, Clinical Surgery, and Diseases and Injuries of the Eye, Midwifery and Diseases of Women, and, if not passed previously, Medical Jurisprudence and Public Health, but it is optional to candidates who have passed the Third Examination to be admitted to the subject of Medical Jurisprudence and Public Health on lodging certificates of having attended the necessary course in that subject at any time, but the subjects of Medicine, Surgery and Midwifery shall be taken together at any time after the end of the fifth Winter Session, provided that a period of 24 months has elapsed since passing the Second Examination All candidates shall be subjected, in addition to the written and oral examinations, to clinical examinations in Medicine and Surgery, which shall include the Examination of Patients Physical Diagnosis, the Clinical use of the Microscope, Examination of the Urine and Urinary Deposits Surgical Appliances Bandages Surface Markings &c The fees payable for the Final Examination shall be—for the whole examination, £15 for re-entry after rejection, £5 and for the subjects of Medical Jurisprudence and Public Health when taken separately, £5, with £3 for re entry in that subject.

There are six periods of examination annually, four in Edinburgh and two in Glasgow The Registrar in Edinburgh is Mr D L. Eadie, 50, George square and the Registrar in Glasgow Mr Walter Hurst, 242, St Vincent-street, to whom fees and certificates must be sent for the respective examinations and from whom further particulars concerning fees can be obtained

ROYAL COLLEGE OF PHYSICIANS OF EDINBURGH
THE MEMBERSHIP AND FELLOWSHIP

In addition to the diplomas granted by the Scottish Conjoint Board the Royal College of Physicians grants its Single Licence to candidates already possessing legal qualifications for professional practice

The Royal College of Physicians of Edinburgh grants a *Membership* and a *Fellowship*

Membership —A candidate who must be a Licentiate of a British or Irish College of Physicians or a graduate in medicine of a University within the British Empire approved by the Council and 24 years of age, is examined in medicine therapeutics and in any branch of the departments of medicine specially professed *such* as general pathology psychology public health, obstetrics gynæcology, diseases of children tropical medicine or medical jurisprudence The fee for the Membership is £36 15s 15 guineas of which will be *returned* to any successful candidate who was already a Licentiate of the College at the time of qualifying for the Membership

Fellowship —The Fellows are selected from the ranks of the *Members* The fee is £64 18s

ROYAL COLLEGE OF SURGEONS OF EDINBURGH
THE FELLOWSHIP

The Royal College of Surgeons of Edinburgh also admits to the examination for its Single Licence any candidates who hold a Diploma in Medicine of any British, Indian or Colonial university or of any British or Colonial College of Physicians or of the Society of Apothecaries of London or Apothecaries Hall, Dublin granted under the provisions of the Medical Act 1886 whose preliminary examination and course of professional study is proved to be sufficient to fulfil the requirements of the College or to those who have passed a full examination for any of the above. Female practitioners are now admitted to the Licence of the College but not to the Fellowship and the regulations for the Licence apply to practitioners of either sex

The Royal College of Surgeons of Edinburgh grants a diploma of Fellowship after examination to the holders of the surgical degrees of diplomas of such British examining bodies as well as of the holders of such surgical degrees of the Universities of Canada Australia, New Zealand and the Indian Empire as are recognised by the College

The Fellowship —Candidates for the examination must be 25 years of age and must have been engaged in practice for at least two years The examination is of a practical nature partly written and partly viva voce and must include surgery and surgical anatomy, operative surgery, and clinical practice One optional subject must also be taken, the range of these specialisms covering nearly every branch of medicine The fee to be paid on entering for examination for Fellowship is £45, £10 of which is remitted to those who already hold the Licentiateship of the College Candidates rejected at the examination obtain repayment of fee less £10 retained for examination expenses One month s notice of intention to present himself for examination must be given by the candidate to Mr D L Eadie, 50, George-square, Edinburgh, clerk to the College, together with credentials signed by two Fellows of the College, one of whom must be a resident in Edinburgh, unless a special application be made to the President and the Council of the College

THE ROYAL FACULTY OF PHYSICIANS AND SURGEONS OF GLASGOW

Like the preceding corporations, the Royal Faculty of Physicians and Surgeons of Glasgow grants a Fellowship and a Licence to be held as separate qualifications

Fellowship —The Fellowship of the Faculty is granted after examination in medicine or surgery, together with an optional subject, which may be anatomy or physiology or be selected from any special branch of medicine or surgery, or in one subject to medical practitioners who serve in the present war 14 days' notice must be given by the candidate of his intention to present himself to Mr Walter Hurst, the Faculty Hall, 242 St Vincent-street, Glasgow The fee for the Fellowship is £30, £10 of which sum are returned to any successful candidate who already holds the Licence of the Faculty An additional sum of £20 is required in the case of candidates resident within seven miles of Glasgow In certain circumstances Fellows may be elected as a mark of distinction Special regulations are in force for medical practitioners serving in the present war

Licence —The Licence of the Royal Faculty is granted as a separate qualification to qualified practitioners in Medicine after examination in surgery including surgical anatomy and clinical surgery The fee is 15 guineas

SCOTTISH PROVINCIAL ANCILLARY SCHOOLS AND HOSPITALS

The hospitals which are recognised by the Scottish Conjoint Board, as places where professional study for their diplomas can be pursued are all those institutions which feed the medical faculties of the universities In addition the Scottish Boards recognise all the places which are recognised by the English Conjoint Board (see p 299) and the Irish Conjoint Board (see p 315)

III —IRELAND
THE UNIVERSITIES

UNIVERSITY OF DUBLIN, TRINITY COLLEGE (SCHOOL OF PHYSIC)

Matriculation —All students intending to join the School of Physic must pass a matriculation examination. University students take the Entrance of Trinity College and a Junior Freshman Term or a special Medical Preliminary, Extern Students, any examination recognised by the General Medical Council The winter courses begin on Oct 1st

Degrees in Medicine (*M B*) *Surgery* (*B Ch*), *and Midwifery* (*B A O*).—Candidates for these degrees must be of B A. standing and must be for at least five academic years on the books of the Medical School, reckoned from the date of matriculation. The Arts course may be taken concurrently with the Medical course, and the B A degree need not be taken before the final medical examinations, but the Medical degrees are not conferred without the Arts degree. The following courses must be attended —(1) Lectures—Systematic, Descriptive and Applied Anatomy, Chemistry and Practical Chemistry Surgery and Operative Surgery, Histology Botany Zoology Physics and Practical Physics Physiology and Practical Physiology, Practice of Medicine Midwifery Pathology Materia Medica and Therapeutics Medical Jurisprudence and Hygiene, (2) three courses of nine months attendance on the Clinical Lectures of Sir Patrick Dun s or other

Candidates must attend for at least three years the medical and surgical practice of a recognised hospital, they must have attended courses of at least nine months in clinical medicine and clinical surgery and have acted as clerk in the medical and dresser in the surgical wards of a hospital *Attendance is required on the practice of a dispensary* or the out practice of a hospital and also on courses in Mental Diseases, Fevers, Ophthalmology, Post-mortem examinations, and other special subjects The candidate is also required to have been properly instructed in Vaccination and to have attended at least 20 Midwifery cases

The fee for the degrees of M B and Ch B amounts to £23 2s

Besides the Royal Infirmary (270 beds) students have the opportunity of attending the following institutions City Fever Hospital, Sick Children s Hospital, General Dispensary and Lying in and Vaccine Institutions, Royal Lunatic Asylum, Ophthalmic Institution &c

Degrees of M D and Ch M—Candidates for either of these degrees must already hold the degrees of M B and Ch B of Aberdeen A thesis has to be presented and an examination has to be passed in Clinical Medicine (or in some special Department of Medical Science) or Clinical Surgery, as the case may be

A diploma in Public Health is granted by the University to graduates in Medicine of a University in the United Kingdom, after a special examination

Application for further information should be addressed to the Secretary of the Medical Faculty

Professors—*Physics* C Niven D Sc, F R S *Physiology* J A. MacWilliam, M D *Medicine* Ashley W Mackintosh M D *Chemistry* Fred Soddy, F R S *Anatomy* R W Reid, M D, F R C S *Surgery* John Marnoch M B, C M *Materia Medica* J T Cash, M D, LL D, F R.S *Midwifery* Robert G McKerron, M D *Forensic Medicine* Matthew Hay, M D, LL D *Botany* J W H Trail, M D, F R S *Pathology* Theodore Shennan, M D *Natural History* J Arthur Thomson, M A., LL D

Scholarships and Prizes—In the Faculty of Medicine of the University of Aberdeen there are the following Bursaries, Scholarships, and Prizes —Bursaries about 15 Bursaries (competition and presentation) are open each year, of £15 to £30 per annum in value, most of them being tenable for three years, certain other Bursaries are not confined to the Faculty of Medicine, but may be held by Arts Students Scholarships five Post-Graduate Scholarships value £36 to £160 per annum Prizes and Medals 13 Gold Medals and Prizes for proficiency in special *departments*, &c

Clinical Instruction is given in the Aberdeen Royal Infirmary (270 beds) by the physicians and surgeon to the staff, many of whom are in the list of professors and other lecturers and demonstrators

ABERDEEN ROYAL ASYLUM—Contains, with hospital attached to main institution and agricultural branch, about 986 beds Medical Superintendent Dr William Reid Assistant Physician Dr A W H Cheyne Clerk and Treasurer, Mr A Scott Finnie, 343, Union street, Aberdeen Clinical instruction is given to students during three months in summer

P Crosbie Anæsthetist Dr M V Shanahan Radiologist Dr G Hegarty Pathologist Dr A E. Moore. House Surgeon Dr W P Lehane House Physician Dr J C Saunders Dentist Mr T C Butterfield. Honorary Secretary Dr N I Townsend Clinical instruction is given daily in the wards Special instruction on Ophthalmic Surgery and Diseases of Women and Children will be given in the special wards for such cases Fee for perpetual ticket £22 1s, for nine months £9 9s, for six months £6 6s, for three months £3 3s Two resident pupils recognised Hospital , (3) Practical Vaccination, one month's instruction , (4) Mental Disease, three months , (5) Practical Midwifery with Clinical Lectures, including not less than 30 cases, six months , (6) Ophthalmic Surgery, three months Three groups of examinations have to be passed Preliminary Scientific Examination, including Physics and Chemistry, Botany, and Zoology The Intermediate Medical Part I , including Anatomy and Physiology The Intermediate Medical, Part II , including Applied Anatomy and Applied Physiology , and the Final Examination, which is divided into Part I , Materia Medica, Hygiene and Jurisprudence, and Pathology , and Part II , Medicine, including Clinical Surgery, Midwifery, Gynæcology, Mental Diseases Operations, and Clinical Ophthalmology Part I may be passed in the fourth year and Part II completed at the end of the fifth year

Doctor in Medicine —A Doctor in Medicine must have passed all the qualifying examinations and must be a B A of three years' standing He must also read a thesis before the Regius Professor of Physic

Master in Surgery —A Master in Surgery must be a Bachelor in Surgery of the University of Dublin of not less than three years' standing, and must produce satisfactory evidence of having been engaged for not less than two years from the date of his registration in the study, or study and practice, of his profession He must then pass a special examination

Master in Obstetric Science —A Master in Obstetric Science must be a Bachelor of three years standing and produce evidence of having been engaged in the study of Obstetric Medicine and Surgery during two years He is then required to pass a special examination

University Diplomas —Candidates for the diplomas in Medicine, Surgery, or Obstetric Science must be matriculated in Medicine and must have completed two years in Arts and five years in Medical Studies The Course and Examination necessary for the diplomas are the same as for the degrees A diploma in Medicine, Surgery, and Midwifery is a registrable qualification conferred upon candidates who have completed a full five years' course in Medicine and two years in Arts A diplomate, on completing his course in Arts and proceeding to the degree of B A., may become a Bachelor by paying the degree fees

Bachelor in Dental Science and Master in Dental Science —The regulations under which these degrees are awarded can be obtained by application to the Registrar of the School of Physic

Professors and Lecturers —Regius Professor of Physic John Mallet Purser, M D Regius Professor of Surgery Edward H Taylor, M D University Professor of Anatomy and Chirurgery Andrew Francis Dixon M B , Sc D University Professor of Chemistry Sydney Young, Sc D , F R S University Professor of Botany Henry H Dixon, Sc D , F R S Erasmus Smith s Professor of Natural Philosophy William E Thrift, M A Professor of Surgery Thomas E Gordon, M B Professor of Zoology and Comparative Anatomy H W Mackintosh M A. King s Professor of Practice of Medicine James Craig, M D King s Professor of Materia Medica and Pharmacy Walter G Smith, M D King s Professor of Institutes of Medicine W H Thompson, M D , Sc D King s Professor of Midwifery T Henry Wilson F R C P I Honorary Professor of Laryngology and Otology Sir Robert H Woods M D , M Ch Honorary Professor of Dermatology Wallace Beatty, M D Lecturer in Medical Jurisprudence and Hygiene Henry T Bewley M D Lecturer in Pathology Alexander C O Sullivan M D Lecturer in Dental Surgery and Pathology A W W Baker M D , M Dent Sc Lecturer in Dental Mechanics Joseph Cockburn L D S Lecturer in Orthodontia E Sheldon Friel M Dent Sc Lecturer in Anæsthetics T Percy C Kirkpatrick M D

All Degrees and Courses of Instruction are open to women students

Clinical instruction —The hospital facilities for clinical instruction available in Dublin will be described below

THE NATIONAL UNIVERSITY OF IRELAND

Matriculation —All students intending to proceed to the medical degree of the University of Ireland must pass a matriculation examination, the examination taking place in June and September in Dublin and at certain local centres All students must pass in five subjects All students must pass in the following subjects[1] except students not born in Ireland, and other students whose home residence shall have been outside Ireland during the three years immediately preceding their matriculation , but all such students will be expected to attend a course of instruction in Irish Literature and History prior to obtaining any degree in the University —1 Irish 2 Latin or Greek. 3 French, German, Italian, Spanish, Portuguese Russian, Welsh, Dutch or any other language approved by the Senate 4 English 5 Mathematics 6 Latin, Greek, French, German, Welsh, Spanish, Italian, Portuguese, Russian, or any other modern language approved by the Senate History and Geography (*as a composite subject*), History, Geography, Natural Philosophy, or Physics as an alternative, Chemistry, Botany, and for women candidates only, Physiology, and Hygiene Candidates who under the regulations are exempted from the necessity of presenting Irish as one of their subjects may present as their fifth subject either a second language or a second science subject. Students entering for degrees in Medicine or Dentistry, if already registered by the General Medical Council, may be accepted as matriculated students of the Faculty of Medicine on passing the matriculation examination in any faculty of the University

The medical degrees granted are —

M B , B Ch , and B A O , and M D , M Ch , and M A O — Printed forms of application for admission to any medical examination may be had from "The Registrar, The National University of Ireland, *Dublin* "

The Constituent Colleges of the National University of Ireland at which the full curriculum for medical degrees can be obtained are University College, Dublin , University College, Cork , and University College, Galway

UNIVERSITY COLLEGE, DUBLIN —The University and the College were created by the Irish University Act, 1908, and by Charters issued in December, 1908 Former students of the Cecilia street School of Medicine who graduated in the Royal University may become graduate members of the new College The constitution of the College, like that of the Constituent Colleges of Cork and Galway, provides for a governing body, an academic council consisting of professors and coöpted lecturers, a body of graduate members, and a body of student members matriculated in the University The first professors and lecturers were appointed by the Dublin Commissioners Irish Universities Act, 1908

Matriculation —Almost all the students of the College are matriculated students of the National University of Ireland

University Examinations in Medicine —The First Examination includes Physics, Chemistry Botany, and Zoology The examination may be taken in two parts Part I, Physics and Chemistry , Part II , Botany and Zoology Honours may be obtained only when both parts are taken as one examination The Second Examination includes Anatomy and Physiology Both must be passed at the same time The Third Examination includes Pathology, Medical Jurisprudence and Hygiene and Materia Medica

Degrees of M B , B Ch , and B A O —The Examination in Medicine, Midwifery Surgery, and Ophthalmology includes both the theoretical and the clinical branches No student can enter for the M B B Ch , or B A O until the end of the fifth year when the curriculum has been completed The course of study is as follows —First year —Winter Anatomy and Practical Anatomy (required for the Second Examination),[2] Chemistry, Practical Chemistry, and Experi mental Physics (with Laboratory Course) Summer Zoology, Practical Zoology, Botany, and Practical Botany Second year—Winter Anatomy Practical Anatomy Physiology, and Practical Physiology (physical and chemical) Summer Anatomy, Practical Anatomy Physiology and Practical Histology Third year—Winter Pathology, Surgery or Medicine, Hygiene Medical Jurisprudence, and Practical Pharmacy Summer Materia Medica and Therapeutics, and Practical Pathology Candidates are also required to attend a General Hospital for nine months (winter and summer) Fourth year or fourth and fifth years.—Winter Medicine or Surgery (the subject to be that not taken in the third year), and Midwifery and Gynæcology Summer Operative Surgery Applied Anatomy, and Ophthalmology and Otology Candidates are also required to attend a General Hospital for nine months (winter and summer) and to take instruction in Vaccination, and three months Fever Hospital Fifth year—If the Academic (Collegiate) Courses are taken as above the Courses of the fifth year will be the following Hospital Attendance General Hospital, nine months, Clinical Ophthalmology and Otology, three months, Practical Midwifery and Gynæcology six months, Mental Diseases to be attended at a Lunatic Asylum, three months (Note—Practical Midwifery and Gynæcology may be taken in the fourth year after the Systematic Course of Midwifery, but it must not be taken concurrently with the period of attendance at Fever Hospital) The degree of M D may be obtained either by examination or on published work.

---

[1] The Senate has directed that candidates who presented themselves for the Matriculation Examination and who passed in certain subjects in 1912 or any previous year may when presenting themselves in 1918, in the remaining subjects necessary to complete the examination select such completing subjects in accordance with the regulations as to groups of subjects which were in force in 1912. Such candidates will not be obliged to present themselves for examination in Irish. Such candidates however while they may select the completing subjects as above must present themselves for examination in these subjects on the courses prescribed in each by the Regulations in 1918 Candidates who presented themselves for the Matriculation Examination and who passed in certain subjects in 1913 when presenting themselves in 1918 in the remaining subjects necessary to complete the examination must select such completing subjects in accordance with the regulations as to groups of subjects which were in force in 1913 The courses in such completing subjects will be the courses prescribed in those subjects respectively for 1918

[2] These courses are not required for the First Examination in Medicine but must be taken in the first year to permit a candidate to qualify for admission to the Second Examination in Medicine at the end of the second year

Dean of the Faculty (of the College) Professor McLoughlin

[1] The Senate has directed that candidates who presented themselves for the Matriculation Examination and who passed in certain subjects in 19 2 or any previous year may when presenting themselves in 1916. in the remaining subjects necessary to complete the examination select such completing subjects in accordance with the regulations as to groups of subjects which were in force in 1912. Such candidates will not be obliged to present themselves for examination in Irish Such candidates however while they may select the completing subjects as above must present themselves for examination in these subjects on the courses prescribed in each by the Regulations in 1918 Candidates who presented themselves for the Matriculation Examination and who passed in certain subjects in 1913 when presenting themselves in 1918 in the remaining subjects necessary to complete the examination must select such completing subjects in accordance with the regulations as to groups of subjects which were in force in 1913 The courses in such completing subjects will be the courses prescribed in those subjects respectively for 1918

[2] These courses are not required for the First Examination in Medicine but must be taken in the first year to permit a candidate to qualify for admission to the Second Examination in Medicine at the end of the second year

QUEEN'S UNIVERSITY OF BELFAST

There are six degrees in the Faculty of Medicine of the University—viz., Bachelor of Medicine (M.B.), Bachelor of Surgery (B.Ch.), Bachelor of Obstetrics (B.A.O.), Doctor of Medicine (M.D.), Master of Surgery (M.Ch.), and Master of Obstetrics (M.A.O.). The University also grants a Diploma in Public Health, particulars of which will be found in the University Calendar. The degrees of M.B., B.Ch., and B.A.O. are the primary degrees in the Faculty of Medicine, and are conferred at the same time and after the same course of study. No student is admitted to the final examination for these degrees until he has shown (1) that he is a matriculated student of the University, (2) that he has completed the prescribed course of study in the Faculty of Medicine extending over a period of not less than five academic years from the date of his registration as a student of Medicine by the General Council of Medical Education and Registration of the United Kingdom, (3) that he has passed the several examinations prescribed, (4) that he has attended in the University during three academic years at least the courses of study prescribed for such degrees (the Senate may accept, for not more than two academic years of the required five, courses of study pursued in any other University or School of Medicine approved by the Senate), and (5) that he has attained the age of 21 years. Every candidate for admission as a matriculated student of the University shall pass such Matriculation Examination or fulfil such other test of fitness as may be prescribed by the Senate, which may prescribe the conditions under which students who have passed the Matriculation or Entrance Examination of any other University or College approved for that purpose (or who have fulfilled such other test of fitness as may be prescribed) may be exempted from passing the Matriculation Examination of the University. For information as to Scholarships and Prizes inquiry should be made of the Secretary of the University.

Primary Degrees of M.B., B.Ch., B.A.O.—All candidates for these degrees must satisfy the examiners in the subjects of four examinations known as the First, Second, Third, and Fourth Medical Examinations respectively.

The First Medical Examination.—The subjects of this examination are Chemistry (Inorganic and Organic), Experimental and Practical Physics, Botany and Zoology, and Practical Botany and Zoology. The examination will be divided into two parts which may be taken separately: I., Chemistry, Practical Chemistry, and Experimental Physics (including laboratory work); II., Botany and Zoology (including laboratory work).

The Second Medical

previously passed in all the subjects of the Second Medical Examination.

Degrees of M.D., M.Ch., and M.A.O.—These degrees are not conferred until the expiration of at least three academic years, or in the case of graduates of the University in Arts or Science of at least two academic years, after admission to the primary degrees in the Faculty of Medicine. Every candidate must show that in the interval he has pursued such courses of study, or been engaged in such practical work as may be prescribed. These degrees may be conferred by the Senate either (*a*) after an examination which includes written, oral, clinical, and practical examinations, or (*b*) on the submission of a thesis or other evidence of original study or research, to be approved by the Faculty of Medicine after an oral or other examination of the candidate on the subject thereof.

The Medical School.—The Donald Currie Chemical Buildings contain a lecture theatre, a preparation room, a chemical museum, a large class-room for elementary practical chemistry, laboratories for qualitative and quantitative analysis, rooms for water and gas analysis, dark room for photographic purposes and balance room, provided with all modern appliances. The Anatomical Department contains a large and well lighted dissecting room, a lecture-room, a professor's and demonstrator's room, a bone-room, and a laboratory for microscopic and photographic work. The Medical Museum is in the same building. The Jaffé Laboratories for Physiology comprise a lecture theatre, laboratories for practical work in chemical physiology, histology, and experimental physiology, and in addition small private research rooms, including balance, galvanometer, and centrifuge rooms. The Musgrave Pathological Laboratory.—In this department opportunity is afforded for research in pathology and bacteriology. The department is in touch with most of the hospitals in Belfast, and there is an ample supply of material for investigation by graduates in morbid histology, clinical pathology, and the bacteriology of infectious diseases. A course in pathology or bacteriology is given to graduates, and members of this class have an opportunity of seeing the methods employed in the various investigations carried out in the department for the Public Health Committee of the corporation in connexion with water supply, sewage disposal, meat- and milk supply, the diagnosis of cases of infectious diseases, &c. The certificate issued to members of the class in bacteriology qualifies for the D.P.H. degree. The Pharmaceutical Laboratory is fitted and equipped for the work of practically instructing students in the compounding and dispensing of medicines.

will be appointed by competitive examination Clinical prizes will be given by the staff at the close of the session

Cork North Charitable Infirmary and County and City of Cork General Hospital (112 beds) *—Physicians Mr D D Donovan and Dr Edward Magner Surgeons Mr C Y Pearson, Mr John Dundon, Mr N H Hobart, and Mr D J O Mahony Assistant Physician Mr R B Dalton Assistant Surgeon Mr Richard P Byrne Second Assistant Surgeon Mr D F Hegarty Resident Surgeon John Higgins Resident Physician (Vacant) Pathologist Dr W Magner Radiologist Dr C B Pearson Anæsthetist Mr D M Donovan Surgeon Dentist Mr William Pericho Dispensing Chemist Mr M Tucker Honorary Secretary Mr R B Dalton. Clinical instruction is given daily in the wards by the physicians and surgeons Special instruction is given to Junior Students on two days weekly Fee for perpetual ticket, £22 1*s* , for 12 or nine months, £9 9*s* , for six months, £5 5*s* , and for three months, £3 3*s* Two resident pupils are appointed quarterly by the medical staff All resident pupils are required to be registered pupils of the Hospital There is a special department for treatment of the eye, ear, throat, and nose under the charge of Mr J Bowring Horgan, and a Special Dental Department

Mercy Hospital —Staff Consulting Physician Dr P J Cremen Consulting Ophthalmic Surgeon Dr J J McMahon Physicians Dr C Cantillon and Dr D J O'Connor Surgeons Mr J Giusani, Mr J Dundon, and Mr R P Crosbie Ophthalmic Surgeon Mr J M Browne Ophthalmic and Aural Surgeon Mr V O Hea Cussen Surgeon Dentist Mr H O Keeffe Anæsthetist and Radiographer Mr Walter Rahilly Pathologist Dr M A Shinkwin , two resident students This hospital contains 130 beds for medical and surgical cases There is also a daily extern for medical and surgical cases as well as for diseases of the eye, ear, and throat. Extern medical attendances, 3371 , surgical attendances, 2361 , ophthalmic attendances (nose, ear and throat) 5056 , intern patients 1354 Major operations, 254 , minor operations, 567 Honorary Secretary to the Staff Dr D J O Connor

Cork District Lunatic Asylum —Psychological Medicine A course of Clinical Lectures on Mental Disease and Allied Neuroses will be delivered in the Cork District Lunatic Asylum on Mondays and Thursdays, commencing the first Thursday in May, by the Resident Medical Superintendent All students wishing to enter for the course are expected to attend at the Asylum at 4 P M on that day All information may be had at the Asylum from Dr James J FitzGerald, resident medical superintendent

Victoria Hospital (Cork) —Honorary Staff Dr Ashley Cummins, Dr C Yelverton Pearson, Dr P Lee, Dr Hobart and Dr C B Pearson Lady Superintendent Mrs George Armstrong There are 75 beds Clinical instruction on Diseases Peculiar to Children is given The extern department is open daily at 9 30

County and City of Cork Lying in Hospital (Erinville, Western road , founded 1798) —Staff Honorary Consulting Physicians Dr W E Ashley Cummins and Dr D D Donovan Honorary Obstetric Surgeon Mr C Yelverton Pearson Physicians Dr N H Hobart, Dr Lucy E Smith, Dr Daniel J O'Connor, and Dr P J O'Brien Assistant Physicians Dr E V Cantillon and Dr C B Pearson This hospital contains 20 beds Fee for six months' attendance, including clinical lectures, £3 3*s* For further particulars apply to N H Hobart honorary secretary to staff

Cork Maternity (Batchelor s Quay) —Staff Consulting Obstetric Physicians Dr T Gelston Atkins and Dr Henry Corby Obstetric Physicians Dr John Booth, Dr Michael Cagney, and Dr Walter Rahilly Examiner Dr R P Crosbie Three resident pupils are taken into the Maternity Poor women are attended at their own homes Clinical lectures are delivered during the session There is an extern department for the treatment of women's and children s diseases Fee for attendance at clinical lectures and certificate, £3 3*s* Honorary secretary to staff, Dr Henry Corby

Cork Fever Hospital —Staff Ordinary Physicians Dr D J Flynn and Dr T Callaghan Extraordinary Physician Dr D Murphy Resident Medical Officer and Registrar Dr A G Sutton Upwards of 500 cases of various forms of fever and zymotic disease are treated yearly in this hospital The Resident Medical Officer gives instruction in Practical Pharmacy, a certificate of which is necessary for the National University and Colleges of Physicians and Surgeons of Edinburgh

Cork District Hospital (Douglas road , 1200 beds) —Staff Dr W E Ashley Cummins (Professor of Medicine, University College, Cork, Examiner in Medicine, National University of Ireland), Dr J Giusani, Mr D Morrissy, and Mr James T O'Connor Resident Medical Officers Dr O Mullane and Mr M Sexton This hospital includes special buildings for fever and other infectious diseases (100 beds) , for children s diseases (100 beds) , and a Lock hospital, the only one in the South of Ireland (80 beds) It affords an extensive field for the study of all classes of diseases, acute and chronic, including special departments for gynæcology and diseases of the skin and nervous system. The physicians and surgeons visit the hospitals every morning at 10 o'clock Lectures and clinical instruction are given daily in the wards by the physicians and surgeons Further particulars may be obtained from Dr W E. Ashley Cummins 17 St Patrick's place, honorary secretary, medical staff.

Cork Eye, Ear, and Throat Hospital (Western road) —Staff Visiting Surgeon Dr Arthur W Sandford. Assistant Surgeons Dr T H D Townsend and Dr J M Browne. Consulting Physician Dr W E Ashley Cummins Consulting Surgeon D H N Hobart. House Surgeon Dr J P Hosford This hospital is open to students attending the University College and others Certificates of attendance for three or six months can be obtained The hospital contains 35 beds Over 4000 cases are treated during the year Clinical instruction is given to students attending the hospital with demonstrations on the use of special instruments A course of Lectures on Ophthalmic Surgery is delivered during the session For further information apply to Dr Arthur Sandford, 13 St. Patrick's place Cork.

UNIVERSITY COLLEGE, GALWAY SCHOOL OF MEDICINE —The College contains well lighted and ventilated dissecting room and anatomical lecture theatre , physiological, pathological, pharmaceutical, chemical, and physical laboratories , anatomical, pathological, gynæcological, and materia medica museums , as well as a large natural history and geological museum and an extensive library in which students can read and from which they can borrow books There are 14 Entrance Scholarships, value £30 and £25 each, for which Medical Students compete with other Students on the Entrance Course In the Second, Third, and Fourth Years two Scholarships in each year, value £25 each are reserved for Medical Students There are extensive grounds, a portion of which is occupied by a Botanic Garden and a portion is at the disposal of the College Athletic Union There are several student societies in the College including a Biological Society There are abundant facilities for research and Post-graduate work in the Chemistry, Physiology and Pathology departments. There are ample facilities for female students. Further information can be obtained from the Registrar of the College.

QUEEN'S UNIVERSITY OF BELFAST

There are six degrees in the Faculty of Medicine of the University—viz., Bachelor of Medicine (M B), Bachelor of Surgery (B Ch.), Bachelor of Obstetrics (B A.O) Doctor of Medicine (M D), Master of Surgery (M Ch.), and Master of Obstetrics (M A.O) The University also grants a Diploma in Public Health, particulars of which will be found in the University Calendar The degrees of M B , B Ch and B A.O are the primary degrees in the Faculty of Medicine, and are conferred at the same time and after the same course of study No student is admitted to the final examination for these degrees until he has shown (1) that he is a matriculated student of the University, (2) that he has completed the prescribed course of study in the Faculty of Medicine extending over a period of not less than five academic years from the date of his registration as a student of Medicine by the General Council of Medical Education and Registration of the United Kingdom, (3) that he has passed the several examinations prescribed, (4) that he has attended in the University during three academic years at least the courses of study prescribed for such degrees (the Senate may accept, for not more than two academic years of the required five, courses of study pursued in any other University or School of Medicine approved by the Senate), and (5) that he has attained the age of 21 years. Every candidate for admission as a matriculated student of the University shall pass such Matriculation Examination or fulfil such other test of fitness as may be prescribed by the Senate which may prescribe the conditions under which students who have passed the Matriculation or Entrance Examination of any other University or College approved for that purpose (or who have fulfilled such other test of fitness as may be prescribed) may be exempted from passing the Matriculation Examination of the University For information as to Scholarships and Prizes inquiry should be made of the Secretary of the University

Primary Degrees of M B , B Ch , B A O—All candidates for these degrees must satisfy the examiners in the subjects of four examinations known as the First, Second, Third, and Fourth Medical Examinations respectively

The First Medical Examination—The subjects of this examination are Chemistry (Inorganic and Organic) Experimental and Practical Physics Botany and Zoology and Practical Botany and Zoology The examination will be divided into two parts which may be taken separately I , Chemistry, Practical Chemistry and Experimental Physics (including laboratory work), II., Botany and Zoology (including laboratory work)

The Second Medical Examination—The subjects are Anatomy and Practical Anatomy Physiology and Practical Physiology Candidates who have previously passed the First Medical Examination may present themselves for this examination at the close of their second year

The Third Medical Examination—The subjects are (1) Pathology and Practical Pathology, (2) Materia Medica, Pharmacology and Therapeutics, (3) Medical Jurisprudence, (4) Hygiene. Candidates who have previously passed the Second Medical Examination may present themselves for this examination at the close of the third year Attendance on a course in any subject of the Third Medical Examination shall not entitle a student to a certificate of attendance unless he has previously passed in all the subjects of the First Medical Examination.

The Fourth Medical Examination.—The subjects are (1) Medicine, (2) Surgery, (3) Midwifery, (4) Ophthalmology and Otology This examination may be taken in two parts I. Systematic, II., Clinical, Practical and Oral Candidates who have previously passed the Third Examination may present themselves for Part I of the Fourth Examination at the close of the fourth year provided that they have fulfilled the necessary requirements as to attendance, &c. on the courses of instruction in the subjects of examination Candidates who have passed Part I of this examination may present themselves for Part II at the close of the fifth year, provided that they have fulfilled the necessary requirements as to hospital attendance on the various clinical courses in the subjects of examination Parts I and II may be taken together at the close of the fifth year Attendance on a course in any subject of the Fourth Medical Examination shall not entitle a student to a certificate of attendance unless he has previously passed in all the subjects of the Second Medical Examination

Degrees of M D , M Ch , and M A O—These degrees are not conferred until the expiration of at least three academic years, or in the case of graduates of the University in Arts or Science of at least two academic years, after admission to the primary degrees in the *Faculty of Medicine. Every candidate must show that in* the interval he has pursued such courses of study, or been engaged in such practical work as may be prescribed These degrees may be conferred by the Senate either (*a*) after an examination, which includes written, oral, clinical, and practical examinations, or (*b*) on the submission of a thesis or other evidence of original study or research to be approved by the Faculty of Medicine after an oral or other examination of the candidate on the subject thereof

The Medical School—The Donald Currie Chemical Buildings contain a lecture theatre, a preparation room, a chemical museum, a large class room for elementary practical chemistry, laboratories for qualitative and quantitative analysis, rooms for water and gas analysis, dark room for photographic purposes and balance room, provided with all modern appliances The Anatomical Department contains a large and well lighted dissecting room, a lecture-room, a professor's and demonstrator s room, a bone-room, and a laboratory for microscopic and photographic work The Medical Museum is in the same building The Jaffé Laboratories for Physiology comprise a lecture theatre, laboratories for practical work in chemical physiology, histology, and experimental physiology and in addition small private research rooms, including balance, galvanometer, and centrifuge rooms The Musgrave Pathological Laboratory—In this department opportunity is afforded for research in pathology and bacteriology The department is in touch with most of the hospitals in Belfast, and there is an ample supply of material for investigation by graduates in morbid histology, clinical pathology, and the bacteriology of infectious diseases A course in pathology or bacteriology is given to graduates, and members of this class have an opportunity of seeing the methods employed in the various investigations carried out in the department for the Public Health Committee of the corporation in connexion with water supply sewage disposal meat- and milk supply, the diagnosis of cases of infectious diseases, &c The certificate issued to members of the class in bacteriology qualifies for the D P H degree The Pharmaceutical Laboratory is fitted and equipped for the work of practically instructing students in the compounding and dispensing of medicines

The Wellcome Historical Medical Museum, 34A, Wigmore-street, London W will be closed for cleaning from Sept 1st to the 30th inclusive

The Austin Edwards X Ray Films —We have tested the Austin Edwards X ray films and find them to have certain advantages over the more usual glass plates Apart from the inherent qualities of a light flexible and unbreakable support these are coated on both sides which not only prevents curling but gives a double thickness of deposit This means that much shorter exposures can be employed A further advantage is that several films can be developed at once effecting a considerable saving of time in the dark room For all ordinary cases these films are very satisfactory and should be specially valuable in military work The fact remains however, that celluloid is not so transparent as well selected glass and becomes less so when coated on both sides with gelatine consequently a film will always lack the brilliancy of a glass plate coated one side only Where it is essential to show fine and delicate detail as in certain bone diseases and pulmonary affections, the glass plate is still the best

Staff —Physicians Dr Wallace Beatty, Dr H Bewley, and Dr G Peacocke Surgeons Mr T E Gordon, Mr L G Gunn, and Mr W Pearson Obstetric Surgeon Sir W J Smyly Ophthalmic Surgeon Mr J B Story Throat Surgeon Dr S Horace Law Pathologist Dr A Stokes Assistant Physician Dr W G Harvey Anæsthetist Dr Piel

The Wellcome Historical Medical Museum, 34a, Wigmore-street, London, W , will be closed for cleaning from Sept 1st to the 30th inclusive

The Austin Edwards X Ray Films —We have tested the Austin Edwards X ray films and find them to have certain advantages over the more usual glass plates Apart from the inherent qualities of a light flexible and unbreakable support these are coated on both sides, which not only prevents curling but gives a double thickness of deposit This means that much shorter exposures can be employed A further advantage is that several films can be developed at once, effecting a considerable saving of time in the dark room For all ordinary cases these films are very satisfactory and should be specially valuable in military work The fact remains however, that celluloid is not so transparent as well-selected glass, and becomes less so when coated on both sides with gelatine consequently a film will always lack the brilliancy of a glass plate coated one side only Where it is essential to show fine and delicate detail as in certain bone diseases and pulmonary affections, the glass plate is still the best

Staff—Physicians Dr Wallace Beatty, Dr H Bewley, and Dr G Peacocke Surgeons Mr T E Gordon, Mr L G Gunn, and Mr W Pearson Obstetric Surgeon Sir W J Smyly Ophthalmic Surgeon Mr J B Story Throat Surgeon Dr S Horace Law Pathologist Dr A Stokes Assistant Physician Dr W G Harvey Anæsthetist Dr Piel

THE Wellcome Historical Medical Museum, 34A, Wigmore street, London, W , will be closed for cleaning from Sept 1st to the 30th inclusive

THE AUSTIN EDWARDS X RAY FILMS —We have tested the Austin Edwards X ray films and find them to have certain advantages over the more usual glass plates Apart from the inherent qualities of a light flexible and unbreakable support these are coated on both sides which not only prevents curling but gives a double thickness of deposit This means that much shorter exposures can be employed A further advantage is that several films can be developed at once, effecting a considerable saving of time in the dark room For all ordinary cases these films are very satisfactory and should be specially valuable in military work The fact remains, however that celluloid is not so transparent as well selected glass, and becomes less so when coated on both sides with gelatine consequently a film will always lack the brilliancy of a glass plate coated one side only Where it is essential to show fine and delicate detail as in certain bone diseases and pulmonary affections, the glass plate is still the best

Staff —Physicians Dr Wallace Beatty, Dr H Bewley, and Dr G Peacocke Surgeons Mr T E Gordon, Mr L G Gunn, and Mr W Pearson Obstetric Surgeon Sir W J Smyly Ophthalmic Surgeon Mr J B Story Throat Surgeon Dr S Horace Law Pathologist Dr A Stokes Assistant Physician Dr W G Harvey Anæsthetist Dr Piel

THE Wellcome Historical Medical Museum, 34A, Wigmore-street, London, W, will be closed for cleaning from Sept 1st to the 30th inclusive

THE AUSTIN EDWARDS X RAY FILMS —We have tested the Austin Edwards X ray films and find them to have certain advantages over the more usual glass plates Apart from the inherent qualities of a light flexible and unbreakable support, these are coated on both sides, which not only prevents curling but gives a double thickness of deposit This means that much shorter exposures can be employed A further advantage is that several films can be developed at once, effecting a considerable saving of time in the dark room For all ordinary cases these films are very satisfactory and should be specially valuable in military work The fact remains however, that celluloid is not so transparent as well selected glass, and becomes less so when coated on both sides with gelatine consequently a film will always lack the brilliancy of a glass plate coated one side only Where it is essential to show fine and delicate detail as in certain bone diseases and pulmonary affections, the glass plate is still the best

Staff —Physicians Dr Wallace Beatty, Dr H Bewley, and Dr G Peacocke Surgeons Mr T E Gordon, Mr L G Gunn, and Mr W Pearson Obstetric Surgeon Sir W J Smyly Ophthalmic Surgeon Mr J B Story Throat Surgeon Dr S Horace Law Pathologist Dr A Stokes Assistant Physician Dr W G Harvey Anæsthetist Dr Piel

Two resident surgeons are elected yearly and four resident pupils half yearly At the termination of the session prizes in Clinical Medicine and Surgery and in Dermatology will be awarded

Hudson Scholarship —In addition to the junior prizes the Hudson Scholarship, £30 and a gold medal, as well as a prize of £10, together with a silver medal, will be awarded at the end of the session for proficiency in medicine, surgery, gynæcology, and pathology

The certificates of attendance are recognised by all the Universities and licensing bodies in the United Kingdom Further particulars may be obtained from Dr H Bewley

Coombe Lying in Hospital and Guinness Dispensary for the Treatment of Diseases Peculiar to Women, Dublin —This hospital contains nearly 70 beds and consists of two divisions, one of which is devoted to lying in cases and the other to the treatment of diseases peculiar to women. THE Wellcome Historical Medical Museum, 34A, Wigmore-street, London, W will be closed for cleaning from Sept 1st to the 30th inclusive

THE AUSTIN EDWARDS X RAY FILMS —We have tested the Austin Edwards X ray films and find them to have certain advantages over the more usual glass plates Apart from the inherent qualities of a light flexible and unbreakable support these are coated on both sides which not only prevents curling but gives a double thickness of deposit This means that much shorter exposures can be employed A further advantage is that several films can be developed at once, effecting a considerable saving of time in the dark room For all ordinary cases these films are very satisfactory and should be specially valuable in military work The fact remains however, that celluloid is not so transparent as well selected glass, and becomes less so when coated on both sides with gelatine consequently a film will always lack the brilliancy of a glass plate coated one side only Where it is essential to show fine and delicate detail as in certain bone diseases and pulmonary affections, the glass plate is still the best

Staff—Physicians Dr Wallace Beatty, Dr H Bewley, and Dr G Peacocke Surgeons Mr T E Gordon, Mr L G Gunn, and Mr W Pearson *Obstetric Surgeon* Sir W J Smyly Ophthalmic Surgeon Mr J B Story Throat Surgeon Dr S Horace Law Pathologist Dr A Stokes Assistant Physician Dr W G Harvey Anæsthetist Dr Piel

Two resident surgeons are elected yearly and four resident pupils half yearly At the termination of the session prizes in Clinical Medicine and Surgery and in Dermatology will be awarded

Hudson Scholarship—In addition to the junior prizes the Hudson Scholarship, £30 and a gold medal, as well as a prize of £10, together with a silver medal, will be awarded at the end of the session for proficiency in medicine, surgery, gynæcology, and pathology

The certificates of attendance are recognised by all the Universities and licensing bodies in the United Kingdom Further particulars may be obtained from Dr H Bewley

THE Wellcome Historical Medical Museum, 34A, Wigmore-street, London, W will be closed for cleaning from Sept 1st to the 30th inclusive

THE AUSTIN EDWARDS X RAY FILMS —We have tested the Austin Edwards X ray films and find them to have certain advantages over the more usual glass plates Apart from the inherent qualities of a light flexible and unbreakable support these are coated on both sides, which not only prevents curling but gives a double thickness of deposit This means that much shorter exposures can be employed A further advantage is that several films can be developed at once, effecting a considerable saving of time in the dark room For all ordinary cases these films are very satisfactory and should be specially valuable in military work The fact remains however, that celluloid is not so transparent as well selected glass, and becomes less so when coated on both sides with gelatine consequently a film will always lack the brilliancy of a glass plate coated one side only Where it is essential to show fine and delicate detail as in certain bone diseases and pulmonary affections, the glass plate is still the best

THE COLONIAL MEDICAL SERVICE

IN the self governing dominions Canada, Australia, New Zealand, the Union of South Africa, and Newfoundland, medical appointments are made concerning which information can be obtained from the High Commissioners or Agents General in London, appointments in Egypt and the Soudan are regulated from the Foreign Office, in Aden and adjacent territories the appointments are under the control of the Government of Bombay, in Rhodesia the appointments are made by the British South Africa Company, London Wall Buildings, E C, in North Borneo application should be made to the British North Borneo Company, 37, Threadneedle street, E C, for appointments, and those in Sarawak are in the hands of H H the Rajah

But in addition to all these there are a large number of important posts under the patronage of the Secretary of State for the Colonies These concern East Africa (the East Africa, Uganda, Nyasaland, Somaliland, and Zanzibar Protectorates), Eastern (Ceylon, the Straits Settlements, and Federated Malay States, Hong Kong, Weihaiwei, Mauritius, and Seychelles), West India (British Guiana, Jamaica, Trinidad, the Windward Islands, the Leeward Islands, Barbados, British Honduras, and the Bahamas), Fiji and the Western Pacific, Cyprus, Malta, Gibraltar, St Helena, Bermuda, and the Falkland Islands, and West Africa (Nigeria, the Gold Coast, Sierra Leone, and the Gambia) As a general rule, each Colony or Protectorate has its own public service distinct from that of every other, and it is usually only the higher officers who are transferred by the Secretary of State from one Colony to another, but there are two exceptions to this rule The West African Medical Staff, which serves Nigeria, the Gold Coast, Sierra Leone, and the Gambia, form one service, and in practice the medical services of the Straits Settlements and the Federated Malay States may be regarded as one, as the officers may be and frequently are transferred from the Colony to the States, or *vice versa* In Ceylon, Mauritius, Jamaica, Barbados, the Bahamas, and Bermuda vacancies are almost always filled locally by the appointment of qualified native candidates, or—in the case of some of the higher posts—by transfer from other Colonies Appointments in Malta are all filled locally Vacancies in the Hong Kong Medical Department are generally filled by transfer from other Colonies In most cases the duties of a colonial medical officer are of a very general character, including medical, surgical, and often public health work It is only occasionally that a specialist is required All applicants must be between the ages of 23 and 35, but in the case of East Africa, Uganda, Nyasaland, Somaliland, and Zanzibar preference will be given to candidates who are over 25 years of age, while in the case of Fiji and the Western Pacific preference will be given to candidates who are under 30 Candidates must be doubly qualified, and the choice will usually fall, other things being equal, on those who have held hospital appointments

East African Protectorates—Medical Officers in the East Africa Uganda Nyasaland Somaliland and Zanzibar Protectorates are appointed on probation in the first instance for three years at the end of which period their appointments are made permanent if their service has been satisfactory but special arrangements are now in force in Uganda. The salary of a Medical Officer during probation is £400 per annum fixed but as soon as he has been confirmed in the permanent appointment his salary rises by annual increments of £20 to £500 per annum There are 17 appointments of this nature in the East Africa Protectorate 18 in Uganda 11 in Nyasaland 5 in Zanzibar and 3 in Somaliland In the East Africa Protectorate there are certain special appointments—viz Deputy Principal Medical Officer (£600–25–700 and £60 duty allowance) Bacteriologist (£600–25–700) Assistant Pathologist and Assistant Bacteriologist (£400) Two Senior Medical Officers (£500–25–600 with £50 duty allowance) Analyst (£400–20–450) Chief Sanitation Officer (£600–25–700 and £60 duty allowance), and Three Medical Officers of Health (one at £500–25–600 with £50 duty allowance and two at £400–20–500 with £40 duty allowance) In Uganda there is a Deputy Principal Medical Officer (£500–25–600 and £50 duty allowance) a Bacteriologist (£500 and £50 duty allowance), a Sanitary Officer (£500–25–600 and £50 duty allowance) and Two Senior Medical Officers with the same emoluments. The salary attached to the appointment of Principal Medical Officer in the East Africa Protectorate and in Uganda is £750 per annum rising to £850 per annum by annual increments of £25 and £600 per annum rising to £700 per annum by annual increments of £25 in the case of Nyasaland Medical Officers are permitted to take private practice on the understanding that they give precedence to their official duties There are also at present in Uganda certain temporary Medical Officers whose appointments (at a salary of £400 a year) have been created in order to cope with the work in connexion with special measures to control sleeping sickness,
ereal disease and plague A candidate for the Uganda service will
ral be offered one of these temporary appointments in the first
nd will be considered for absorption, if he wishe
opportunity occurs provided that his service is approved. Temporary Medical Officers are engaged for three years and free passages are provided If a temporary Medical Officer is subsequently appointed to the permanent staff of the Protectorate in which he has been employed on a temporary footing his temporary service will ultimately be reckoned for pension.

Straits Settlements[1]—Medical Officers are appointed as House Surgeons or Assistant Health Officers at a salary of £350 After one year's satisfactory service House Surgeons are appointed Medical Officers with salary rising from £400 to £600. Above this class there are nine senior appointments carrying salaries ranging from £600 (rising to £720) to £750 (rising to £900) The Principal Civil Medical Officer receives £1050, rising to £1200 Duty allowances are attached to all appointments and free quarters or an additional allowance in lieu thereof are given to House Surgeons The authorised establishment is at present 32 officers

Federated Malay States[1]—Appointments are graded as follows:—Principal Medical Officer, £1050 to £1200 Senior Medical Officer Perak £750 rising to £900 Senior Medical Officer Selangor, £800, rising to £1000 seven Medical Officers Grade I £600 by £20 annually to £720 18 Medical Officers, Grade II £350 and after one year's satisfactory service £400 rising to £600 with free furnished quarters, without private practice A Medical Officer is attached to the Regiment of Malay States Guides his salary being £360 to £480 The Senior Medical Officers in Perak and Selangor and the two Grade I. Medical Officers in charge of Negri Sembilan and Pahang are allowed consulting practice only Other Medical Officers are prohibited from private practice except in very special cases where the Chief Secretary is satisfied that, owing to the absence of private practitioners, it is absolutely necessary to allow the Government Medical Officer to attend to private patients The posts of Medical

widows and orphans of public officers

Windward Islands (Grenada St. Lucia, St. Vincent)—The appointments are with few exceptions district appointments with the right to private practice attached, the salaries paid by Government vary from £250 to £350 with allowances in certain cases. The Governor has the power to transfer a medical officer from one island to another at his discretion The appointments are pensionable.

Leeward Islands (Antigua St. Christopher and Nevis Dominica, Montserrat, Virgin Islands)—The 24 appointments are of the same nature as in the Windward Islands but are not pensionable An officer when first sent out is not appointed to a particular island but to the service of the Leeward Islands, with a salary of £250, and the Governor decides as to the district which is to be allotted to him. In certain districts he may be required to perform magisterial duties. The medical officers receive fees for successful vaccinations post-mortem examinations attendance and giving evidence at courts of justice, certificates of lunacy and in the larger islands, for burial certificates. They are also as a rule, allowed private practice.

British Honduras—There are seven medical appointments (besides the principal post of Colonial Surgeon) each carrying a salary of $170
per annum Unless they already possess a Diploma of Public Health, medical officers are liable to be required before they join the colony to undergo a course of instructi at a laboratory of public health or

private practice, so far as is consistent with the proper discharge of their duty to the Government, but in most districts the private practice is very small. They are required either to take charge of hospitals or of districts, at the discretion of the authorities. The posts are pensionable. There are at present 15 Medical Officers, in addition to a Chief Medical Officer (£700 a year rising to £800) The medical services of Fiji and the Western Pacific are interchangeable. While serving in the Western Pacific Protectorates their duties may be of a quasi-magisterial nature and they draw an extra non pensionable allowance of £50 per annum

Cyprus—There is a Chief Medical Officer paid at the rate of £500 per annum and three District Medical Officers paid at the rate of £275 per annum all enjoying private practice (except the Chief Medical Officer who is allowed consulting practice only) and receiving 2s per diem forage allowance these are the only medical appointments in the island which are open to English candidates

Gibraltar—There is a surgeon of the Colonial Hospital receiving £400 with fuel and light allowances and private practice He also receives £50 for medical examination of school children There are also two Assistant Surgeons with a salary of £350 per annum who are allowed private consulting practice only Free quarters unfurnished, are provided for all three officers

St Helena—The Colonial Surgeon at present receives £270 per annum and £27 horse allowance. Private practice is allowed

Falkland Islands—There are two appointments The Colonial Surgeon is paid at the rate of £350 per annum, with £25 as Health Officer The Assistant Colonial Surgeon is paid at the rate of £400 per annum without quarters Part of the salary is provided from private sources Private practice is allowed to the Colonial Surgeon and to a lesser extent to the Assistant Colonial Surgeon

Leave and Passages—In the East African Protectorates leave of abs full salary is granted in the normal case after a tour of ot less than 20 nor more than 30 months) to an each completed month of residence (or 2½ days officer is not returning to East Africa) exclusive oyages to and fro Officers serving in Uganda, stations in the East Africa and Nyasaland Pro- six or three days leave respectively in respect ervice In Somaliland special leave regulations for an officer taking leave approximately every as passages are provided for the officer only In a two months leave of absence with full salary may spect of each year's service, and this leave may be p to a maximum of eight months. Additional leave ay be granted on special grounds If an officer on the first leave is in receipt of a pensionable salary of less year he is granted a free return passage to the United In Hong Kong leave of absence on half salary may be r 4½ years service, and a portion of such leave may be if the Governor agrees, for half the amount on full pay ence in excess of 10 months at a time will not be granted but n may be allowed for ill health or very urgent private affairs o the necessities of the service, leave of absence on half be granted to officers in other Colonies outside tropical a period of six years resident service without any special Officers of the Fiji and Western Pacific service proposing to ir leave in Europe may receive a grant in aid of passage of £60 Leave may be given before the expiration of the due case of serious indisposition, or of urgent private affairs. In ce of special grounds the leave must not exceed one-sixth of r's resident service on special grounds it may exceed that six months In addition to the above vacation leave on may be granted if no inconvenience or expense is caused not exceeding three months in any two years. In the case of the Western Pacific and the Falkland Islands, 4½ months y be granted in any three years

t appointment an officer whose salary and fees together do not 500 a year will, except in the case of a few Colonies possessing ntative Assemblies be provided by the Crown Agents for the with free passages to the Colony for himself and his wife dren if any not exceeding four persons besides himself The appointed will be required to execute an agreement binding repay the cost of the passage or passages so obtained in the his leaving the Government service within three years This plies also to officers appointed to the Malay Peninsula and Hong Kong An officer taking leave out of the Colony has to provide his own passages

Pensions—Officers on the pensionable establishment in the East African Protectorates are at liberty to retire on attaining the age of 50 years. Earlier retirement in the event of ill-health is also provided for Pensions are computed on the scale of one-sixtieth of the average annual salary of the retiring officer's fixed appointments for three years prior to retirement but for purposes of calculating pensions two years service is reckoned as service for three years In most of the other Colonies an officer holding a pensionable appointment may be allowed in the case of ill health to retire on a pension after ten full years resident service otherwise he must have attained the age of 55. For ten full years resident service fifteen sixtieths of the average annual salary of the retiring officer's fixed appointments for three years prior to retirement may be awarded, to which one-sixtieth may be added for each additional year's service but no addition will be made in respect of any service beyond 35 years For pension purposes absence on vacation leave counts as full service and leave on half pay as half service. In a few cases the retiring age is 60, and the pension after ten years service is ten sixtieths instead of fifteen

West African Medical Staff

The medical services of the West African Colonies and Protectorates—namely the Gambia, Sierra Leone the Gold Coast (including Ashanti and the Northern Territories) and Nigeria—form one service under the above name All the medical officers for the service are selected by the Secretary of State for the Colonies and are on one list for employment and promotion. As in other Colonies applicants must be between 23 and 35 years of age and possess a double qualification but preference is given to those over 25 and the unmarried. The higher grades are usually filled by promotion from the lower

The grades and emoluments of officers of the staff are as follows:—

Director of the Medical and Sanitary Service: This post exists in Nigeria only The salary attached to it is £1500 a year with a duty allowance at the rate of £250 a year

A duty allowance is payable to the holder of the appointment to which it is attached only while he is actually performing its duties, and during his absence or incapacity it is paid at the discretion of the Governor to the officer performing them for the time being A duty allowance is not a pensionable emolument.

Principal Medical Officer The Principal Medical Officers receive salary as follows: In Nigeria (Southern Provinces) £1200 a year with a duty allowance at the rate of £240 a year In Nigeria (Northern Provinces) £1100 a year with a duty allowance at the rate of £220 a year In the Gold Coast £1200 a year with a duty allowance at the rate of £240 a year In Sierra Leone £1000 a year with a duty allowance at the rate of £200 a year There is no Principal Medical Officer in the Gambia.

Deputy Principal Medical Officer There are four appointments of this grade three in Nigeria and one in the Gold Coast Salary at the rate of £900 a year rising by annual increments of £25 to £1000 a year is attached to these appointments together with a duty allowance at the rate of £180 a year

Senior Sanitary Officer: There are four appointments of this grade two in Nigeria one in the Gold Coast and one in Sierra Leone Salary at the rate of £900 a year rising by annual increments of £25 to £1000 a year is attached to these appointments together with a duty allowance at the rate of £180 a year

Provincial Medical Officer There are seven appointments bearing this title (four in Nigeria, two in the Gold Coast and one in Sierra Leone) with salary at the rate of £800 a year rising by annual increments of £25 to £900 a year and duty allowance at the rate of £160 a year

Senior Medical Officer There are 20 appointments of this grade, with salary at the rate of £600 a year rising by annual increments of £25 to £750 a year and a duty allowance at the rate of £120 a year

The Senior Medical Officer of the Gambia, who is the head of the Medical Department of that Colony draws staff pay at the rate of £120 a year in addition to duty pay

Junior Sanitary Officer There are seven appointments of this grade with salary at the rate of £700 a year rising by annual increments of £25 to £800 a year and a duty allowance at the rate of £140 a year

Medical Officer: The salary attached to this grade is at the rate of £400 a year rising by annual increments of £20 to £500 a year with duty allowance at the rate of £80 a year Medical Officers who have served for five years and are recommended for a higher rate of salary are required to take a special course of study for three months If they obtain satisfactory certificates at the end of the course they are placed on completing six years service, on a scale of salary at the rate of £525 a year rising by annual increments of £25 to £600 a year with duty allowance at the rate of £100 a year A Medical Officer who has served for three years on the maximum salary of this scale (£600) without obtaining promotion is eligible for the grant of further annual increments of £25 up to a total maximum salary of £750 a year Salary at the rate of £500 rising by annual increments of £25 to £600 a year is attached to about ten posts (those of Pathologist at Accra, Assistant at the Medical Research Institute near Lagos and Medical Officer of Health at various places) irrespective of the seniority of the officer holding the appointment In addition to the duty pay (£100 a year) staff pay at the rate of £100 a year is also attached to these posts, and the holder of the appointment draws half of the staff pay during leave of absence,* the remainder being drawn by his locum tenens Certain other allowances are also drawn by members of the Staff (*a*) When the Principal Medical Officer certifies that it is necessary for a medical officer to keep some means of conveyance to enable him efficiently to perform his official duties he may be granted an allowance (*b*) The Government carries free of cost a reasonable amount of stores (*c*) Government officers in Sierra Leone the Gold Coast and Nigeria receive when travelling on duty away from their stations free transport and travelling (or "bush") allowance In the Gambia the travelling allowance is fixed at a rate which includes the cost of transport (*d*) All medical officers whatever their rank while employed with a military expedition will be paid an allowance of 10s a day and they will also be given free rations, or an allowance of 3s a day in lieu of rations whenever other officers employed with the expedition are given free rations or an allowance in lieu of rations While in receipt of these allowances medical officers will not be entitled to any repayment or allowance under (*c*) (*e*) An allowance of £12 is paid to every medical officer before his departure on first appointment towards the purchase of camp outfit Instruments and drugs and all medical appliances (including microscopes when necessary) are supplied by the Government for all public purposes.

Leave and Passages—The ordinary tour of residential service is one year followed by leave with full pay during the voyages to and from England and for four or two months clear in England according as the officer is returning for further service in West Africa or not If an officer is detained beyond the year additional leave is given with full pay for ten days in respect of each completed month beyond twelve whether he is returning or not. If he is invalided before the end of the year the leave with full pay is for the voyages and for ten or five days in respect of each completed month according as he is returning or not Leave granted on the understanding that an officer will return is known as "return leave," and any pay drawn in respect of such leave is liable to be refunded if he does not return. Medical officers desiring an extension of ordinary leave of absence for purposes of study may be granted such extensions with half salary Leave may be extended with half pay for a period not exceeding four months on the ground of ill health or without pay on that or other grounds. Free passages are given to all officers who are granted leave, and free passage is also given on first appointment subject to the officer signing an agreement under which he is liable to refund its cost if he relinquishes his appointment for any other reason than physical or mental infirmity or is removed for misconduct, within three years from the date of his arrival in West Africa. Half pay is given during the voyage out on first appointment The period of probation for Medical Officers is two tours of service

All officers of the Staff except Principal Medical Officers, Deputy Principal Medical Officers Provincial Medical Officers, Sanitary Officers, and a few other officers holding special appointments, are at present allowed to take private practice provided that it does not interfere with the efficient performance of their official duties, but it is within the power of the Governor to withdraw or suspend the privilege in such places and for such periods as he may consider desirable. Private practice does not exist at the majority of stations and as a general rule subject to the exigencies of the service, stations where there is private practice are allocated to senior members of the staff At all the recognised stations single quarters free of rent (but not of rates and similar outgoings) are provided for medical officers or an allowance is paid in lieu of quarters

---

* That is, during leave on full salary During leave on half salary he draws only one-quarter of the staff pay during leave without salary he draws no staff pay

Pensions and Gratuities —On attaining the age of 50 years or after 18 years service (of which at least 12 must have been residential) an officer is qualified for a pension calculated at one-fortieth of the last annual[3] salary for each year of service If invalided after a minimum of seven years service he is qualified for a pension calculated at the same rate If invalided before completing seven years service he is qualified for a gratuity not exceeding three-quarters of a month s salary for each six months of service provided that he has been confirmed in his appointment For the purpose of calculating the amount of these pensions and gratuities *leave of absence without salary* is not counted In addition to the ordinary regulations an officer of the West African Medical Staff enjoys the following special privilege At the end of nine years (of which not less than six must have been residential) he will be permitted to retire with a gratuity of £1000 or at the end of 12 years (of which not less than eight must have been residential) with a gratuity of £1250 All claims to pensions are however forfeited on the receipt of such a gratuity In the event of an officer dying in the service after completing the period of residence qualifying him for the smaller or the larger of these gratuities a sum equal to the gratuity in question will be paid to the credit of his estate Officers are recommended not to take their wives out with them until they have acquired experience of the local conditions and have obtained the sanction of the Governor Passages for wives and children are not provided If a candidate is offered an appointment he can usually be allowed sufficient time to make preparations and to terminate the employment in which he may be engaged

Candidates for medical appointments in West Africa are allowed to express a preference for any particular Colony or Protectorate and their wishes in this respect will be borne in mind and met as far as possible, *but they are liable to be posted in the first instance*, or transferred afterwards if necessary to any other West African Colony or Protectorate at the discretion of the Secretary of State Candidates who wish to be posted to the Northern Provinces of Nigeria or the Gambia should be able to ride Officers who may be transferred to pensionable appointments under the Crown elsewhere than in West Africa do not forfeit their claim to pension in respect of their West African service on final retirement provided they have been members of the Staff for at least 12 months

Instruction in Tropical Medicine —Every candidate selected for appointment will unless the Secretary of State decides otherwise be required to undergo a course of instruction for two or three months either at the London School of Tropical Medicine, Royal Victoria and Albert Docks E (near Connaught Road Station) or at the Liverpool School of Tropical Medicine at University College, Liverpool. The cost of the tuition fees board and residence during such instruction amounting to a maximum of £48 8s 10*d* for three months will be borne by the Government in the case of the London School at Liverpool the cost of tuition will be borne by the Government but candidates must make their own arrangements for board and lodging an allowance of £2 a week will be paid to them monthly in arrear for this purpose A daily allowance of 5s (but no salary) will be paid to each candidate monthly in arrear during the course, and may be continued subsequently up to the date of embarkation These payments must be refunded by the candidate if he declines to accept an appointment in any of the Colonies or Protectorates for which he may be selected if he fails to obtain a certificate showing that he has satisfied the school authorities or if he relinquishes the West African service for any other reason than mental or physical infirmity or is removed for misconduct, within three years of the date of his arrival in West Africa. If at the end of the session there exist no vacancy in the staff to which a candidate can be appointed he will be placed in a Reserve and granted an allowance at the rate of £200 a year *until the occurrence of a vacancy* If a medical officer has for any reason not taken a course of instruction prior to appointment he must take it during his first leave of absence

Course of study for higher scale of salary —The approved course of study is the three months course of the West London Post-Graduate College or the London School of Clinical Medicine Greenwich in clinical medicine clinical surgery and pathology Officers are allowed to substitute for this course either the course of study and examination for a recognised diploma or degree in public health sanitary science, or State medicine the course of study and examination for a further medical or surgical diploma or degree or if the Governor on the recommendation of the Principal Medical Officer approves—a course of study in some special branch of medical or surgical practice (e g ophthalmology dermatology, genito-urinary diseases) or an advanced course at the London or Liverpool School of Tropical Medicine Whichever of these courses of study is selected the necessary tuition and examination fees will be paid by the Colonial Government save in the event of an officer s deciding to enter for a further medical or surgical diploma or degree

In conclusion it should be added that the West African Medical Staff, from which many British medical officers have been lent to serve with the Allied forces receive terms and emoluments which compare favourably with other medical services of the Crown Since the outbreak of war it has been the policy of the Secretary of State for the Colonies to refrain from calling the attention of the medical profession to recent improvements in the pay and prospects of the West African Medical Staff in order that the efforts of the naval and military authorities to obtain an adequate supply of medical officers should not be hampered in any degree This consideration no longer applies as it has been so widely recognised by all the younger members of the medical profession that the claims of the Navy and Army are paramount

DENTAL SURGERY

ANYONE who is on the Medical Register is entitled to practise as a dentist, although he cannot register as such without the special licence, but it is of eminent advantage to take the L D S, otherwise few dental appointments at general or special hospitals or dispensaries are available. The subjects beyond those included in the general qualification are—Dental Anatomy and Physiology (Human and Comparative), one course, a separate course of Dental Histology, including the preparation of microscopical sections, Dental Surgery, one course, a separate course of Practical Dental Surgery, a course of not less than five lectures on the Surgery of the Mouth, Dental Mechanics, one course, a course of Practical Dental Mechanics, including the manufacture and adjustment of six dentures and six crowns, Dental Metallurgy, one course, a course of Practical Dental Metallurgy, Practice of Dental Surgery at a recognised school, two years, and a certificate of having been engaged during a period of not less than two years in acquiring a knowledge of Dental Mechanics (this may be obtained by apprenticeship to a duly qualified dental practitioner or in the mechanical department of a recognised dental hospital). The *Dental Schools in London* are the Royal Dental Hospital of London, the National Dental Hospital, Guy's Hospital Dental School, and the London Hospital Dental School Most of the large provincial towns, where there are medical schools, have now dental hospitals

The Registration of Dental Students is carried on at the Medical Council Office in London in the same manner as the existing registration of medical students, and subject to the same regulations as regards Preliminary Examinations. Candidates for a diploma in Dental Surgery must produce certificates of having been engaged during four years in professional studies, including *two years'* instruction in mechanical dentistry The two years of instruction in mechanical dentistry, or any part of them, may be taken by the dental student either before or after his registration as a student, but no portion of such mechanical instruction will be counted as one of the four years of professional study unless taken after registration

It is necessary for anyone practising Dental Surgery in this country to be on the Register, and no foreign qualifications are admitted, except the Dental Diploma granted in Belgium after examination by the Provincial Medical Commission, provided the holder has obtained the grade of "Candidate in Medicine" at one of the four Belgian Universities Diplomates in Dental Surgery of certain Russian Universities who have completed four and a half years studies in Medical and Dental Colleges of the Universities may be allowed to register providing the General Medical Council are satisfied they have completed their course of studies Certain dental qualifications granted in Australia and New Zealand are also registrable The Royal Colleges of the United Kingdom and seven of the Universities grant degrees or licences in Dental Surgery

THE REGISTERING BODIES IN DENTISTRY

The Royal College of Surgeons of England grants a diploma in Dental Surgery under the following regulations, which apply to all candidates who have registered as dental students after *Jan 1st 1897* Candidates are required to pass three examinations the Preliminary Science Examination the First Professional Examination, and the Second Professional Examination I Preliminary Science Examination —This is identical with Part I of the First Examination of the Examining Board in England Candidates who commenced professional study on or after Oct 1st, 1913, must pass the Preliminary Science Examination before commencing the courses required for the Second Professional Examination II The First Professional Examination —The candidate must produce evidence of instruction in Dental Metallurgy and Practical Dental Mechanics The Examination consists of Part I (Mechanical Dentistry) and Part II (Dental Metallurgy), the examination in Dental Metallurgy being by written paper The parts may be taken together or separately III The Second Professional Examination —This is divided into two parts (*a*) the General, (*b*) the Dental. The General part must be passed before the Dental portion The instruction is obtained partly at a General Hospital and partly at a Dental Hospital —The Second Professional Examination consists of Part I, General Anatomy and Physiology General Surgery and Pathology, Part II, Dental Anatomy and Physiology Dental Pathology and Surgery, and Practical Dental Surgery There is a written and *viva voce* examination in each part and a practical examination as well in Part II Exemption from the Preliminary Science Examination is granted to candidates who have passed an Examination in Chemistry and Physics for a degree in Medicine at a University in the United Kingdom, in India, or in a British colony Exemption from Examination in Anatomy and Physiology is granted to candidates who have passed the Second Examination of the Examining Board in England or the corresponding Examination for any degree or qualification in Medicine or Surgery registrable under the Medical Act of 1886 Exemption from Examination in General Surgery and Pathology is granted to candidates who have passed the Examination in Surgery of the Examining Board in England or the corresponding Examinations of the Colleges and University above mentioned. The fee for the diploma is 20 guineas, and is payable as follows — Preliminary Science Examination, 3 guineas, First Professional—Examination, 7 guineas, Second Professional Examination, 10 guineas Synopses of examinations and all further information can be obtained from the Secretary, Examination Hall, Queen square, Bloomsbury, W C

---

[3] Except that the pension of an officer who has been promoted within three years of his retirement is calculated on the average of his salary for the last three years

Royal College of Surgeons Edinburgh —Regulations giving a list of Preliminary Examinations recognised for obtaining the Licence in Dental Surgery as well as of the subjects of the Professional Examinations, may be obtained from Mr D L Eadie, Clerk to the Royal College of Surgeons, at 50, George square, Edinburgh Candidates must produce certificates of having, subsequently to the date of registration, been engaged for four years in professional studies and of three years instruction in Mechanical Dentistry from a registered dental practitioner, except in the case of previously registered medical practitioners, when two years will be considered sufficient. Candidates must also have attended a course of instruction at a University or in an established school of medicine or in a provincial school specially recognised by the College as qualifying for the Diploma in Surgery In addition they will be required to have attended in a recognised dental hospital, or with teachers recognised by the College special courses of lectures and instruction in Anatomy and Physiology (Human and Comparative), Surgery, Pathology Materia Medica, Dental Histology, and Practical Dental Mechanics and Metallurgy, two years' attendance at a dental hospital or the dental department of a general hospital recognised by the College Practical instruction in Mechanical Dentistry from a registered Dentist or in the Mechanical Department of a recognised Dental Hospital and School, for *three* years Candidates who have passed the First and Second Examinations for the Triple Qualification will be exempt from the First Dental Examination, and will have the advantage of being admissible either to the Final Dental Examination or to the subsequent Examination for the Triple Qualification or to both. But the First Dental Examination will not be held as equivalent to the First and Second Triple Examinations, and will admit to the Final Dental Examination only Candidates who are Licentiates of this College or who may be registered medical practitioners will be required to produce certificates of attendance on the special subjects only and will be examined in these only for the dental diploma First Professional Examination The candidate must have attended the required courses The examination embraces (1) Chemistry and Physics, and (2) Anatomy and Physiology The fee is £5 5s for the complete examination, and £3 3s is payable for each division. In all cases of rejected candidates the fee for re-entry is £3 3s Second Examination The candidate must have attended the remaining courses of the curriculum must produce certificates showing that he is 21 years of age, and must pay a fee of £10 10s for re-entry £5 5s The examination embraces (1) Surgery and Medicine, and (2) the special subjects of Dental Anatomy and Physiology Dental Surgery and Pathology Dental Materia Medica, Dental Mechanics and Dental Metallurgy with a practical as well as the written and oral examinations in the subjects of Dental and Oral Surgery Pathology, and Mechanics The candidate will be tested in the Treatment of Dental Diseases, in Operative Dentistry, the Administration of Anæsthetics, Orthodontics, and in Prosthetic and Mechanical Dentistry Candidates who claim exemption from the First Dental Examination on the ground of having passed the First and Second Triple Qualification Examinations or other recognised examinations will before being admitted to the Second Dental Examination, be required to pay the total fee of £15 15s payable for the dental diploma Fees and schedules must be lodged with the Clerk not later than one week before the examination.

Royal Faculty of Physicians and Surgeons of Glasgow —The regulations as to certificates curriculum, number, and subjects of examinations, fees, &c., are in effect similar to those of the Royal College of Surgeons of Edinburgh, but embrace Dental Bacteriology Candidates can enter for the First Examination in three divisions, the first embracing Physics and Chemistry, the second Dental Metallurgy and Dental Mechanics, and the third Anatomy and Physiology The examination in Dental Mechanics is practical, and there is at the Final Examination an examination in Practical Dentistry conducted in a dental hospital Copies of regulations, &c, to be obtained from Mr Walter Hurst, Registrar, Faculty Hall, 242, St. Vincent-street Glasgow

Royal College of Surgeons in Ireland —Candidates for the Licence in Dental Surgery are required to pass two professional examinations Before the First Examination the candidate must produce evidence of having attended courses in Theoretical and Practical Chemistry, including Metallurgy and Physics, at a recognised institution, of having been registered as a medical or dental student by the General Medical Council, and of having attended courses of instruction in the following subjects at a recognised school of medicine (*a*) Anatomy Lectures, (*b*) Dissections with Demonstrations, (*c*) Physiology, including Dental Physiology, (*d*) Practical Physiology and Histology, including Dental Physiology and Histology, Human and Comparative Before the Final Dental Examination the candidate must have been engaged during a period of two years in acquiring a practical familiarity with the details of Mechanical Dentistry under the instruction of a registered dentist, or under the direction of the superintendent of the Mechanical Department of a recognised Dental Hospital, and have attended, at institutions recognised by the College for the purpose, the following courses of instruction (*a*) Dental Surgery and Pathology, Orthodontia, and the Materia Medica and Therapeutics applicable to Dental Surgery Lectures Two courses (*b*) Dental Mechanics Lectures Two courses (*c*) Dental Anatomy Lectures One course. (*d*) The practice of a Dental Hospital, or of the Dental Department of a General Hospital. Two years He must also have attended Clinical instructions at a recognised General Hospital during the ordinary teaching sessions (nine months), and have been engaged during four years in the acquirement of professional knowledge subsequently to the date of registration as a medical or dental student One year's *bonâ fide* apprenticeship with a registered dental practitioner, after being registered as a medical or dental student, may be counted as one of the four years of professional study He must be 21 years of age.

In the First Dental Examination candidates will be examined in (A) Physics and Chemistry, including Practical Chemistry and Metallurgy (B) Anatomy, Physiology, and Histology—General and Dental. All the subjects may be passed at the same time, or they may be passed in two groups (A) and (B) The examination is partly written, partly *vivâ voce*, and partly practical

In the Final Dental Examination candidates will be examined in General Pathology Medicine, and Surgery, Dental Surgery and Dental Pathology, with the Materia Medica and Therapeutics applicable to Dental Surgery, Dental Mechanics and Metallurgy, Orthodontia. Candidates must pass in all the subjects at one examination The examination is partly written, partly *vivâ voce*, and partly practical, and includes the examination of patients and the performance of dental operations Candidates are required to provide their own instruments and gold for filling The First Dental Examination will commence on the first Mondays in the months of February, May, and November The Final Dental Examination will commence on the second Mondays in the months of February, May, and November The total fee for the Diploma in Dental Surgery is 20 guineas Candidates must pay the fees for examinations from which they are exempted, unless when such exemptions have been granted in virtue of examinations passed before the Conjoint Board in Ireland

University of Birmingham —The teaching of Dentistry is undertaken by the University acting in association with the Birmingham Dental Hospital and the Birmingham Clinical Board The instruction at the Dental Hospital is carried out under the direction of the University Dental Clinical Board, so that students may fully qualify themselves for the Dental Diploma (L D S) of this and other universities and licensing bodies There is a special and well equipped Dental Museum and Laboratory An Entrance Exhibition, value £37 10*s* is awarded annually at the commencement of the winter session The following are the regulations for Degrees in Dentistry —1. The degrees conferred by the University are those of Bachelor and Master of Dental Surgery (B D S and M D S) 2 All candidates for these degrees must pass the same Matriculation Examination as that required from candidates for Medical Degrees 3 The degree of Bachelor of Dental Surgery is not conferred upon any candidate who has not obtained a Licence in Dental Surgery The candidate is not eligible for the degree until a period of 12 months has elapsed from the passing of his examination for the Licence in Dental Surgery Of this period at least six months must be spent in the dental department of a general hospital approved by the University 4 *A* In addition to the Licence in Dental Surgery the candidate must produce evidence that he has attended the courses required by medical students of the University in the following subjects and passed the Examinations held in the same for Medical and Surgical Degrees (*a*) Chemistry and Practical Chemistry, (*b*) Physics and Practical Physics, (*c*) Elementary Biology, (*d*) Anatomy and Practical Anatomy, and (*e*) Physiology and Practical Physiology *B* That he has passed the class examinations in (*f*) One Special Course of Lectures on Medicine, (*g*) One Special Course of Lectures on Surgery, and (*h*) Pathology and Bacteriology *C* That he has attended courses and passed the class examinations in (*k*) Dental Histology and Patho-Histology, (*l*) Comparative Dental Anatomy, and (*m*) Dental Surgery and Prosthetic Dentistry *D* That he has received instruction in the Clinical Examination of living cases at the dental department of a general hospital for a period of not less than six months 5 The Final Examination will deal with the subjects in Classes *C* and *D* 6 On the expiration of 12 months from the date of passing the Examination for the Degree of Bachelor of Dental Surgery, the candidate will be eligible for that of Master of Dental Surgery 7 For this degree candidates will be required to submit a thesis containing original work and investigations in some subject connected with Dentistry, which thesis shall be submitted to examiners to be nominated by the Dental Advisory Board

University of Bristol —Candidates for the degree of Bachelor of Dental Surgery must be not less than 21 years of age and shall have pursued the courses prescribed by University regulations during not less than five years, of which three shall have been passed in the University, and shall have been registered as dental students by the General Medical Council All candidates for the degree of B D S are required to satisfy the examiners in the several subjects of four examinations The First Examination The subjects are Chemistry, Physics, and Zoology and the curriculum extends over one year The Second Examination The subjects are Dental Mechanics, Dental Metallurgy, and Dental Materia Medica, and the candidate shall produce evidence of having served for two years an approved pupilage in Dental Mechanics The Third Examination The subjects are Anatomy, Physiology, and Histology, Dental Anatomy, and Dental Histology The Final Examination The subjects are Medicine and Surgery, Dental Surgery (including Prosthetics), Operative Dental Surgery, and Dental Bacteriology Degree of Master of Dental Surgery Candidates shall be Bachelors of the University, shall present a Dissertation on some subject of Dental Surgery to be approved by the Examiners, and pass an examination in Dental Surgery Diploma in Dental Surgery Candidates need not be undergraduates, but shall be registered dental students before being admitted to any professional examination, the curriculum extends over four years A two years' pupilage in Mechanical Dentistry is required, and four examinations must be passed the subjects of which diff only from those of the B D S in that Zoology is n required for the First Examination, and Medicine is n required for the Final Examination Candidates who a already registered medical practitioners shall be furth exempted from study and examination in Physics a Chemistry, Anatomy, Physiology and Histology, Medicir and General Surgery

University of Durham —Every candidate for the Licen in Dental Surgery must be registered as a dental studen There are four Examinations The subjects are —*Fir* (*a*) Chemistry, and (*b*) Physics *Second* (*a*) Den Mechanics, Theoretical and Practical, (*b*) Dental Metallur *Third* (*a*) Anatomy, (*b*) Physiology and Histolog (*c*) Dental Anatomy and Dental Histology, and (*d*) Den Materia Medica. *Final* (*a*) Surgery, (*b*) Dental Surge including Prosthetics and Orthodontia, (*c*) Operative Den Surgery, Practical Examination, and (*d*) Dental Patholc and Bacteriology A candidate before presenting hims for examination is required to furnish certificates instruction in the following subjects, attended af registration as a dental student at recognised Colle or Schools —*First Examination* Chemistry and Physi *Second Examination* Dental Mechanics and Dental Met lurgy *Third Examination* Anatomy, with Dissectio Physiology, Histology, Dental Anatomy and Physiolog Dental Histology, and Dental Materia Medica *Fi Examination* Dental Hospital Practice (two year General Hospital Practice (nine months), Medicine Lectu (two terms), Surgery Lectures (two terms), Dental Surg and Pathology (a course of not less than 20 lecture Dental Bacteriology (three terms), Operative Dental Surg (not less than 12 lectures), and Anæsthetics (a course not less than one month)

Before admission to the Final Examination each candic must furnish evidence (1) of having attained the age o years, (2) of having undergone a three years' pupilag Mechanical Dentistry with a registered dentist, and (3 having been engaged in professional study for at least years subsequent to registration as a dental student. examinations will be held concurrently with the med examinations, and the fees payable by candidates ar follows First Examination, £2 10*s*, Second Examinat £2 10*s*, Third Examination, £3 10*s*, Final Examinat £3 10*s*, fee for Licence, £3, total, £15 For re exami tion First Examination, £1 10*s*, Second Examinat £2, Third Examination, £2 (in one part only, £1), Fo Examination, £2. The practical examinations in dent will be conducted at the Newcastle Dental Hospital

University of Leeds —The degrees in Dental Sur are Bachelor of Dental Surgery (B Ch D) and Maste Dental Surgery (M Ch D) All candidates for the degr Bachelor of Dental Surgery shall be required to have pa the Matriculation Examination, to have pursued there approved courses of study for not less than five acad years, two of such years at least having been passed i University subsequently to the date of passing Parts I II of the First Examination, and to have completed period of pupilage or hospital attendance, or both, as be prescribed by the regulations of the University candidate will be admitted to the degree who has attained the age of 21 years on the day of graduation candidates are required to have passed the following minations the First Examination, the Second Examina and the Final Examination. Each examination will in practical work in the subjects offered. All candidates be required, before presenting themselves for examinati furnish certificates testifying that they have attende prescribed courses of instruction in accordance wit regulations of the University in each of the su which they offer, and that they have fulfilled the requirements of the ordinance and regulations in re of such examination Candidates for the Diploma in D Surgery (L D S) are required to present certificates sh that they have attained the age of 21 years, that they attended courses of instruction approved by the versity, extending over not less than four years, that they have completed a pupilage of three years of such years at least having been taken before First Professional Examination. Candidates are re to satisfy the examiners in the several subjects o following examinations A preliminary examinati

Arts, a preliminary examination in Science, the First Professional Examination, and the Final Examination The classes in the Department of Dentistry begin in October The instruction in the Preliminary subjects of Chemistry, Physics, and Biology are given at the University in College road. The classes in the other subjects and the systematic courses in Dental subjects are held in the School of Medicine of the University in Thoresby Place The clinical instruction is given in the Dental Department of the Leeds Public Dispensary, which is affiliated with the University and recognised by the Royal College of Surgeons Applications for the prospectus should be made to the Dean of the Faculty of Medicine

University of Liverpool (Liverpool Dental Hospital Clinical School and School of Dental Surgery) —The University grants a Licence in Dental Surgery (L D S) and degrees in Dental Surgery (B D S and M D S) The courses of systematic instruction are given in the University buildings, five minutes' walk from the Dental Hospital The two institutions are now closely associated, and the management of the curriculum is in the hands of the Board of Dental Studies The Dental Hospital, covering a site of 672 square yards, was opened in March, 1910, equipped in each department with every modern accessory and receives constant additions The laboratory is in charge of a skilled dental mechanic under the supervision of the Director of Dental Education and Dental Staff, and students are able to undertake at the hospital the whole of their training in Mechanical Dentistry The times of the lectures at the University are arranged to meet the convenience of students, thus allowing the maximum time for attendance upon Dental Hospital practice The staff of the hospital includes 12 Dental Surgeons, three Demonstrators, six Anæsthetists three House Surgeons, and a Curator Fees The composition fees are as follows Licence course (L.D S) Composition fee £58 10s for the course of other licensing bodies £61 10s, payable in two equal instalments, the first on entry, the second 12 months later Two years' instruction in Mechanical Dentistry (pupilage) and two years' Dental Hospital Practice (combined), £100, or in two instalments of £52 10s each. Degree course (B D S) £67 10s for all lectures (including Chemistry, Physics, and Zoology) in three instalments Two years' dental hospital, £21, general hospital practice, £10 10s, three years mechanical instruction (pupilage) £105 Further information may be had from the Director of Dental Education, Mr W H Gilmour

University of Manchester —In the University of Manchester the Dental Department forms an integral part of the Faculty of Medicine This contains a series of laboratories, lecture rooms, and museums which will bear comparison with those of any other school in the kingdom, and the fullest opportunities for study are offered to students preparing for any of the professional examinations Instruction adapted to the requirements of students preparing for the B D S Degree and the Dental Diplomas of the University the Royal College of Surgeons of England, and of other licensing bodies is given during the Winter and Summer Sessions both at the University and at the Dental Hospital of Manchester adjoining the University The required general hospital practice is taken at the Manchester Royal Infirmary Women students are admitted to the classes in the Dental Department, and for them common rooms are provided. The composition fee for candidates for the University degree of Bachelor of Dental Surgery is 60 guineas, payable in two equal instalments at the beginning of the first and third years of studentship The composition fee for candidates for the University Diploma in Dentistry is 55 guineas, payable in two equal instalments at the beginning of the first and third years of studentship The composition fee for candidates for the L D S of England is 60 guineas payable in two equal instalments at the beginning of the first and third years of studentship Students who have already served their apprenticeship with a private practitioner, and who propose to complete the final portion of their attendance at the University and at an approved dental hospital will be required to pay the composition fee in two equal instalments at the commencement of the first and second years of studentship The composition fee does not include the hospital fees the examination fees, the fee for the conferment of the degree or the diploma the registration fee, nor the fees for chemicals and chemical apparatus

National University of Ireland —This University grants the degrees of Bachelor of Dental Surgery and a degree of Master of Dental Surgery A student may not be admitted to the Degree of Bachelor of Dental Surgery unless a period of not less than four years shall have elapsed from the date of his matriculation, during which period he must have pursued an approved course of study of not less than nine terms For the degree of Bachelor of Dental Surgery candidates must pass four examinations, the first two being the same as those for the first and second examination in Medicine The subjects of the third examination are Dental and Practical Pathology, Dental Surgery and Dental Medicine, the subjects of the fourth being Dental Surgery and Pathology, Dental Mechanics, Operative Dentistry, Orthodontia, and Dental Materia Medica A candidate for the degree of B D S must produce evidence of having been engaged during a period of two years in acquiring a practical familiarity with the details of Mechanical Dentistry under the instruction of a registered dentist, or under professional direction in the mechanical department of a dental hospital approved by the University A portion of or the entire period may be served before commencing study for the degree of B D S, but no portion so taken prior to commencement of study shall count as part of the four years of Dental Study The degree of Master of Dental Surgery will not be granted until three years after the B D S has been obtained.

London Hospital —This school is a part of the London Hospital and Medical College, and is fully equipped on the most modern lines and with the latest appliances It provides a complete curriculum in all subjects for the L D S Diploma, and is admirably adapted for the purpose of teaching The Conservation Room is well lighted and ventilated and fitted with pump chairs of the latest pattern, the fountain spittoon at every chair has been specially designed and has attached to it a saliva ejector, hot and cold water, compressed air, gas and electric current, also a swing bracket to carry the students' cabinet Electric sterilisers are supplied in each department and motor engines where required. The School possesses in addition to the Theatres, Laboratories and Museums in the College a special Museum of Dental Anatomy and Surgery, Operative Dentistry, Prosthetic and Extraction Rooms, and Laboratories for Practical Dental Metallurgy and Dental Prosthesis A systematic course of instruction in Dental Prosthesis is arranged for pupils The up-to-date Laboratory contains every modern apparatus and is in charge of a skilled curator and his assistants Connected with the Medical College and Dental School are a Library, Athenæum, Clubs' Union, Dining Hall with moderate tariff, Students' Hostel, and an Athletic Ground Lecturers —Chemistry and Dental Metallurgy Hugh Candy, B A., B Sc. Physics A. H Fison, D Sc. Human Anatomy Professor William Wright. Physiology Professor E P Cathcart Dental Surgery and Pathology Sir Francis Farmer Operative Dental Surgery Dr George Northcroft. Dental Prosthesis Mr Wilton Thew Operative Dental Prosthesis Dr G Paton Pollitt. Odonto-phosopic Orthopædics Dr Harold Chapman Dental Anatomy Professor William Wright. Dental Microscopy Mr Evelyn Sprawson. Dental Bacteriology Professor William Bulloch, F R S Dental Materia Medica Dr O Leyton and Mr F A Hocking, B Sc Lond. Dental Anæsthetics Dr R. J Probyn Williams For full particulars as to fees and course of study advised apply to the Dean (Professor William Wright, M B, D Sc., F R C S) who will be glad to make arrangements for anyone wishing to see the Dental School and Medical College

The above arrangements are subject to revision in consequence of circumstances arising out of the war

London (Royal Free Hospital) School of Medicine for Women —Full courses are arranged for women students for the study of dentistry, and in preparation for the Licence in Dental

Surgery of the Royal College of Surgeons of England, at the London (Royal Free Hospital) School of Medicine for Women, in conjunction with the London Dental Hospital, Leicester Square, and the National Dental Hospital, Great Portland street, W The course is arranged as follows First and second years Chemistry, Physics, and Dental Mechanics Third, fourth, and fifth years Anatomy, Physiology, and Special Dental Courses, Courses in Medicine and Surgery, General Hospital Course, Dental Hospital Course The combined fees at the London School of Medicine for Women and the National Dental Hospital are £180 if paid in one sum on beginning the course, or £191 if paid in three annual instalments Bursary The Council of the School will award annually (until further notice) an "Agnes Guthrie" Bursary of the value of £60 to a student fulfilling the required conditions, who enters for the full dental course Candidates are required to send in applications on or before July 1st, to the warden and secretary, from whom a prospectus of the School and all particulars can be obtained

---

PROVINCIAL

Birmingham Dental Hospital —The Dental Hospital was founded in 1858, and was recognised by the Royal College of Surgeons in 1880 for the teaching of Dental Students Having an annual attendance of about 16,000 patients, it affords every advantage for students about to enter the profession to acquire a thorough practical knowledge, as required by the Medical Council The present Hospital was opened on July 6th 1905 It has accommodation for 50 students The equipment is in accordance with the most modern requirements for the efficient teaching and practice of Dental Surgery The operations performed annually average 35,000 including 5000 gold and other fillings, and many cases of crowns, bridges, porcelain inlays, and regulations By arrangements with the Birmingham University and with the General and Queen's Hospitals the entire course of Lectures, Hospital Practice, &c., may be completed for an inclusive fee of £96 15*s*, or including Mechanical Pupilage, £186 The instruments and materials necessary for Hospital Practice cost about £28 The Composition Fee for the courses required for the L D S of the University or any of the Corporations alone, is £60, payable in two annual instalments at the commencement of the first and second years, that for the courses required for the L D S and the Degree in Dentistry of the University is £75, that for the L D S in combination with the M R C S and L R C P is £85, and that for the M B, Ch B, and B D S is £95 All of these composition fees are payable in two annual instalments at the commencement of the first and second years Each of these fees covers the cost of the courses given at the University for the qualifications indicated, but does not include fees for Hospital teaching For two years' dental hospital practice the fee is 20 guineas, payable in two instalments of 10 guineas each at the commencement of the first and second (hospital) years respectively For two years' mechanical pupilage, 85 guineas, which may be paid in two annual instalments of 50 and 35 guineas respectively, mechanical pupils may join for a probationary period of one month, fee 5 guineas, which is deducted upon payment of the full amount For general surgical hospital practice, lectures and demonstrations Surgery, two winters £10 10*s* One Entrance Scholarship is offered annually of the value of £37 10*s* It is awarded to the student who, entering for the Dental Degree of the University in October, or having entered not earlier than the previous April, shall pass the best examination in the subjects studied during his apprenticeship Candidates must be under the age of 21 years Application for admission, together with a certificate of birth must be sent to the Dean of the Medical Faculty on or before Oct 15th Staff —Dean Mr W Thompson Madin Consulting Physician (Vacant) Consulting Surgeon Mr Haslam Consulting Dental Surgeon Mr Frank E Huxley Honorary Dental Surgeons Mr F W Richards Mr F H Goffe Mr A E Donagan Mr J Mountford Mr W T Madin Mr J E Parrott Mr W M Knott, and Mr G F Cale Matthews Honorary Assistant Dental Surgeons Mr A H Parrott Mr C H Howkins, Mr S H Roe, Mr A W Wellings, Mr W Bowater and Mr Harold Round Honorary Orthodontics Officer Mr G F Cale-Matthews Anæsthetists Dr S W Haynes Dr W J McCardie, Mr R H Rollinson Whitaker, Dr R W Taylor Haddow, Mr L Kirkby Thomas, Dr Haitly Burn, and Dr D Buchan Demonstrators Dr Humphrey F Humphreys, Mr N A. Austin, and Dr R A Broderick House Surgeons Mr R L Booth and Mr L Williams Prosthetic Department Mr W M Knott and Mr S H Roe

Leeds Public Dispensary —The Dental Department of the Leeds Public Dispensary is fully equipped to provide training for Dental Students, and affords every opportunity for the student to prepare for any of the Dental Degrees or Diplomas The Demonstrator of Operative Dental Surgery instructs students during their probationary course At the completion of this training students have patients allotted to them by the Demonstrator, and have every opportunity of acquiring knowledge from the members of the Staff, two of whom are in attendance each day The following prizes are awarded —First year Students, value 2 guineas Operative Dental Surgery Prize, value 5 guineas Two prizes in Prosthetic Dentistry (*a*) a prize, value 2 guineas, for first-year pupils, (*b*) a prize, value 5 guineas, open for competition to all Students Extraction prize, value 2 guineas, open for competition to all Students A prize in Orthodontics, value 5 guineas, is open to all students Dental Staff —Consulting Dental Surgeon Mr Frederick Sherburn Dental Surgeons Mr Percival T Leigh, Mr Walter Marston, Mr A. G G Plumley, Mr Stephen D Hey, Mr David Saville, and Mr J Newsome Taylor Assistant Dental Surgeons Mr James W Mawer, Mr Geoffrey A. Phillips, Mr J K Crawford, Mr W S Thorburn, Mr Harold R Bentley, and Mr Sidney H Hole Anæsthetists Dr F Whalley and Mr E Wrigley Braithwaite Demonstrator and Tutor Mr O Vickers Curator of Dental Museum Dr A G G Plumley House Surgeon Mr E A Rogerson Instructor of Dental Mechanics Mr C E Foster Warden Mr Stephen D Hey, to whom all communications should be addressed

Dental Hospital of Manchester —This Hospital is in association for teaching purposes with the University of Manchester and the Royal Infirmary, and is in the centre of a very large population Courses of study are provided to meet the requirements of the various examining bodies, including those of the University of Manchester for the qualifications L D S and B D S, and the L D S of the Royal College of Surgeons of England Clinical instruction is given by the members of the staff and by the house surgeons and demonstrators, and also by the honorary anæsthetists in the administration of nitrous oxide gas, a special class in anæsthetics is conducted by the clinical tutor in that subject

A Travelling Scholarship, value £100, will be awarded from time to time Ten prizes, varying in value from £2 to £8 are awarded annually

For the whole course of hospital instruction for the L D S (including two years' mechanical training) the fee is £100, or if paid in instalments, £105 For the two years' Operative Course only, £21, or if paid in two instalments, 21 guineas For the whole course of hospital instruction for the B D S degree (including mechanical training), £130, or if paid in instalments, 130 guineas Additional practice in Dental Mechanics may be taken by pupils who have already received their mechanical training elsewhere, at a fee of £20 for six months

Women students are admitted to the practice of the hospital.

Staff —Consulting Physician Dr J J Cox. Consulting Surgeon Mr J Howson Ray Consulting Dental Surgeons Mr I Renshaw, Mr W Dykes, Mr W Simms, and Mr J W Dunkerley Dental Surgeons Mr G G Campion, Mr Mr J W Gibbons, Mr D Headridge, Mr R Howard, Mr J Hilditch Mathews, Mr H. W Norman, Dr C H Preston, Mr T E Sherratt, Mr J Stephenson Mr G O Whittaker, Mr S S Doran, Mr T Dykes, Mr Felix Rawsthorne, Dr H Simms and Mr B J Rodway Anæsthetists Mr A. Wilson, Mr S R Wilson Mr E Moir and Dr W Wilson Prosthetic Dental Surgeons Mr J Stephenson and Mr B J Rodway Clinical Tutor in Anæsthetics Mr S R Wilson Demonstrator in Operative Dental Surgery (Vacant) Demonstrator in Orthodontics (Vacant) Demonstrator in Dental Prosthetics Mr E V Pollitt Instructor in Dental Mechanics Mr H W Fillan Tutor Dr C H Preston Curator of Museum Dr C H Preston.

Copies of the Prospectus will be forwarded on application to Mr J Hilditch Mathews Dean.

Newcastle-upon-Tyne Dental Hospital and School —This Hospital is centrally situated (within five minutes of the various colleges, infirmary, and railway station), the rooms are well lighted and thoroughly equipped for carrying on the work Dental surgeons and an anæsthetist attend each morning A tutorial dental surgeon is also in attendance The Composition Fee for the special Dental Lectures and Dental Hospital Practice is £45 3s if paid in one sum, or £46 4s if paid in two instalments of £23 2s The Composition Fee for the Lectures at the Colleges of Medicine and Science is 40 guineas, in addition to this there is a library and an athletic fee Particulars of the fee for General Hospital Practice may be obtained from the Senior House Physician, Royal Victoria Infirmary, Newcastle upon Tyne Medals and Certificates of Merit are granted to students showing certain standards of proficiency in the various classes at the Dental School *Lecturers* —Dental Anatomy and Physiology Mr E Y Richardson Dental Surgery and Pathology Mr J Coltman. Operative Dental Surgery Mr T R D Walkinshaw Dental Histology Mr O L Routledge Dental Mechanics Mr J W Daniels Dental Materia Medica Mr J Bolam Dental Metallurgy Mr C Lotinga Orthodontia Mr A Jameson Dental Anæsthetics Dr W E Alderson The prospectus of the Dental Hospital and School, containing full information, may be obtained from either Mr J T Jameson, 12, Windsor crescent, Newcastle upon Tyne, Dean, or Mr James Coltman, 13, Ellison place, Newcastle upon Tyne, Vice Dean

Devon and Exeter Dental Hospital, 24, Southernhay, West, Exeter —Established 1880 —The hospital is open on Tuesdays, Wednesdays, and Thursdays, and patients are admitted between the hours of 9 and 11 A M Students attend the practice of the hospital under the control of the medical officers Honorary treasurer, Mr J M. Ackland, secretary, Mr Albert G Littlejohn

SCOTLAND

The Incorporated Edinburgh Dental Hospital and School —The Edinburgh Dental Hospital and School is located in a spacious and well equipped building at 31, Chambers street and offers special advantages to dental students The General Courses required for the Dental Diploma may be taken in the Medical School of the Royal Colleges of Physicians and Surgeons or in the University schools The hospital attendance and clinical instruction are taken at the Royal Infirmary The University, Medical Schools, and Royal Infirmary are within three minutes' walk of the Dental Hospital The special courses are taken in the hospital The Dental Hospital practice, extending over two years, affords a student ample opportunity for a full acquaintance with every branch of dentistry The hospital admits a limited number of indentured pupils They receive their instruction in Mechanical Dentistry concurrently with the general and special courses A premium of 60 guineas is payable with each such pupil The practice and lectures of the hospital are recognised by, and qualify for, all the Licensing Boards The cost of the hospital outfit of instruments is included in the Dental Hospital fee of £31 10s The minimum cost of classes and Diploma for the whole course of dental instruction amounts to £93 12s Those students who desire to take a Medical and Surgical Diploma in addition to the L D S have in this school admirable facilities for so doing The triple qualification of the Royal College of Physicians and Surgeons of Edinburgh and the Royal Faculty of Physicians and Surgeons of Glasgow is recommended. The minimum cost of Professional Education, the Triple Qualification, and the Licence in Dental Surgery amounts to £167 14s Further particulars can be obtained from the Dean, Mr W Guy

Incorporated Glasgow Dental Hospital and School, 158, Renfrew-street, and 15, Dalhousie street, Garnethill, Glasgow —Lectures will be delivered on the following subjects Dental Mechanics, Dental Metallurgy, Dental Anatomy and Physiology, Dental Surgery and Pathology, Anæsthetics, Operative Technique, Dental Bacteriology, Operative Dental Surgery, Dental Histology, and Crown and Bridge Work. Fees for two years' hospital practice £18 18s The Composite fee for Lectures and Hospital Practice £40 The hospital is opened daily from 5 to 7 P M (Saturdays excepted) Students may only enrol during the months of April or October Summer session begins in April. Winter session begins in October Prospectus may be had from the Secretary, D M Alexander 186 St. Vincent-street, Glasgow

Glasgow Royal Infirmary (Dental Department) —Mr W Taylor attends at the Royal Infirmary at 9 A M on Mondays, Wednesdays, and Fridays, and gives a course of instruction in Dental Surgery on these days. The following course in the curriculum can be taken at St Mungo's College Anatomy, six months, Practical Anatomy, nine months, Physiology, six months, Chemistry, six months, Practical Chemistry with Metallurgy three months, Surgery, six months, Medicine, six months, Materia Medica, three months, Clinical Surgery, six months, Dental Surgery, six months, and attendance for two years on the dental department of the hospital The attendance on the Dental Clinic is free to students of the hospital

IRELAND

Incorporated Dental Hospital of Ireland, Lincoln-place, Dublin —All Dental Students who have passed their First Dental Examination in the Royal College of Surgeons in Ireland (or an equivalent examination or examinations) are admissible to the Clinical Instruction of the Hospital, after paying fees and subscribing to the conditions prescribed by the staff In addition to Clinical Instruction and Special Demonstrations, courses of lectures are given at the hospital on Dental Surgery and Pathology, Mechanical Dentistry, the Administration of Anæsthetics, Orthodontia, Dental Anatomy, and Dental Materia Medica Practical instruction is also given in Anæsthetics In addition to the longer courses of hospital attendance, courses of three months' duration will be given to surgeons intending to practise in the Colonies or remote country districts, or in the Army and Navy

Fees —Dental Hospital Practice (each year), £12 12s, Lectures, £6 6s, Composition Fee, £15 15s per annum In addition to the above courses registered dentists who are members of the British Dental Association will usually be permitted to take out a three months' course for a fee of 6 guineas The course in practical Dental Mechanics can be taken in the Hospital Laboratory Further particulars can be obtained from the Dean

DIPLOMAS IN STATE AND TROPICAL MEDICINE

As usual we include in the Students' Number of THE LANCET an epitome of the instruction given at various universities and centres of medical education to medical men desiring to obtain diplomas in sanitary science public health, State medicine, and tropical medicine During the war some of this work has been suspended, for both teachers and taught being already registered medical men have been required in other spheres But the public health of the country and of our colonial dependencies must be maintained, for this is one of our greatest guarantees of ultimate success in the struggle of endurance, and the machinery for the special education of public medica servants exists, as appears from what follows, and is ready to resume full activity at the earliest opportunity

Resolutions, designed with a view of ensuring "the possession of a distinctively high proficiency, scientific and practical, in all the branches of study which concern th public health" have been adopted at various times b the General Medical Council from 1902 to 1911 Certai universities and corporations grant qualifications in Tropica Medicine which have not as yet been made registrable b statute

University of Oxford —An examination, conducted partly i writing, partly *vivâ voce*, and in each subject partly practica is held in Michaelmas and Easter Terms in the followin subjects —General Hygiene, General Pathology (wit special relation to Infectious Diseases), the Laws relating t Public Health, Sanitary Engineering, Vital Statistics Th examination is in two parts, which may be taken together o separately, but Part I must be passed either before or a the same examination as Part II The fee for admission t the examination is £6 for each part Successful candidate are entitled to receive the Diploma in Public Health

The First Part of the examination will comprise (*a*) a written paper of three hours in Chemistry and Physics, (*b*) a three hours' practical and *vivâ voce* examination in Chemistry and Physics

The Second Part of the examination will consist of the following parts —(*a*) Two written papers, each of three hours, dealing with General Hygiene (including Sanitary Engineering, Vital Statistics and the Laws relating to Public Health), (*b*) a practical and *vivâ voce* examination in General Hygiene, (*c*) a written paper of three hours in Pathology and Bacteriology, and (*d*) a three hours practical and *vivâ voce* examination in Pathology and Bacteriology

Candidates in Part I of the examination will be required to produce a certificate (1) of Laboratory Work in Chemistry as applied to Hygiene

Candidates in Part II will produce the following further certificates (2) of a Practical Knowledge of the Duties, Routine and Special, of Public Health Administration, (3) of having had Practical Instruction in Bacteriology, and the Pathology of the Diseases of Animals transmissible to Man, and (4) of having attended the practice of a Hospital for Infectious Diseases at which opportunities are afforded for the study of the Methods of Administration The courses of Instruction in Chemistry applied to Hygiene and in Pathology and Bacteriology may be taken in the laboratories of any University in the United Kingdom, of any school of the University of London, of the Royal Army Medical College, of University College, Bristol, of any extramural school in Edinburgh, of Anderson's College, Glasgow, The Royal Institute of Public Health, and in any such other laboratory as may, in the case of any particular candidate be approved of by the Regius Professor of Medicine In the cases of certificates (2) and (4), the certificates shall be given in such form as shall satisfy the secretary to the Boards of Faculties that the candidate has conformed to the rules of the General Medical Council. The names of candidates must be sent to the Assistant Registrar of the University, Clarendon Building Oxford, to whom applications for any further information should be addressed

University of Cambridge —Two examinations in so much of State medicine as comprised in the functions of medical officers of health are held during the year The examination is divided into two parts and demands proficiency in all the branches of study which bear upon the duties of medical officers of health The examinations in both parts will be oral and practical as well as in writing Candidates may present themselves for either part separately or for both together at their option, but the result of the examination in the case of any candidate will not be published until he has satisfied the examiners in both parts Marks of distinction will be placed against the names of candidates who have specially distinguished themselves in either (1) general principles of hygiene, (2) bacteriology, (3) chemistry in Part I of the examination, or (4) the second part of the examination, which has reference to State Medicine and to the applications of Pathology and Sanitary Science. Every candidate will be required to pay a fee of £6 6s before admission or readmission to *either part* of the examination but candidates who have presented themselves before the year 1896 will be readmitted to either part on payment of a fee of £5 5s Candidates must before admission to either part of the examination produce evidence of having satisfied provisions (1) (2), and (3) and before admission to Part II having satisfied provision (4) above mentioned

Two Examinations in Tropical Medicine and Hygiene are conducted yearly by the State Medicine Syndicate of the University of Cambridge. The examinations are held in Cambridge early in January and in the middle of August Each examination will extend over four days

Any person whose name is on the Medical Register is admissible as a candidate to the examination provided (I) that a period of not less than 12 months have elapsed between his attainment of a registrable qualification and his admission to the examination, (II) that he produce evidence satisfactory to the Syndicate, that he has diligently studied Pathology (including parasitology and bacteriology) in relation to Tropical Diseases Clinical Medicine, and Surgery at a Hospital for Tropical Diseases and Hygiene and Methods of Sanitation applicable to Tropical Climates As evidence of study and attainments a candidate may present to the Syndicate (1) any dissertation, memoir, or other record of work carried out by himself on a subject connected with Tropical Medicine or Hygiene, (2) any Certificate or Diploma in Public Health or Sanitary Science he may have obtained from a recognised Examining Body Such evidence will be considered by the Syndicate in determining whether he is qualified for admission to the examination and by the examiners in determining whether, if admitted, he shall be included in the list of successful candidates

The examination will be partly in writing, partly oral, and partly practical and clinical (the clinical part will be conducted at a hospital for tropical diseases, at which cases will be submitted for diagnosis and comment), and will have reference to the nature, incidence, prevention, and treatment of the epidemic and other diseases prevalent in tropical countries Every candidate who passes the examination to the satisfaction of the examiners will receive from the University a diploma testifying to his knowledge and skill in tropical medicine and hygiene The fee for the examination is £9 9s, and applications should be addressed to Dr Graham Smith Medical Schools, Cambridge

All applications for further information respecting these examinations and the courses of study should be addressed to the State Medicine Syndicate, the Chemical Laboratory, Pembroke-street, Cambridge

University of London —Candidates for the M D degree may offer State medicine as a subject in which to graduate Certificates must be produced showing that a course of practical instruction has been attended for the prescribed period, and that the course has included such chemical, microscopical and meteorological work and exercises as more especially relate to sanitation The attendance includes six months' practical instruction in a laboratory and six months' instruction in public health administration under the supervision of a medical officer of health, and three months' attendance on the practice of a hospital for infectious diseases The examination consists of papers in State medicine, including hygiene, school hygiene, and forensic medicine, a paper in medicine, an essay, and a two days' practical examination. Candidates must satisfy the examiners both in the papers and in the practical tests A *vivâ voce* examination may be held at the discretion of the examiners In connexion with this degree the various metropolitan medical schools hold regular classes under teachers of Public Health and Sanitary Science, such instruction being also used to obtain the various diplomas of other Universities and of those Royal Corporations which grant them.

University of Durham —Candidates for the degree of Bachelor of Hygiene (B Hy) must be at least 22 years of age, registered and a graduate in Medicine of a recognised university They must spend six months at Newcastle-upon Tyne studying Comparative Pathology, Practical Bacteriology, Sanitary Chemistry, and Physics and have to pass an examination in Sanitary Chemistry, Physics, Comparative Pathology, Sanitary Legislation, Vital Statistics, Nosology, Climatology, Meteorology, Distribution of Health and Disease, Sanitary Medicine and Practical Hygiene The fee for the examination for the degree of B Hy is £10 10s and for the degree £6 6s Candidates for the degree of Doctor of Hygiene (D Hy) must have acquired the degree of Bachelor of Hygiene must for two years subsequently have been engaged in Public Health administration, or in research work relating to Public Health. The fee for the examination for the degree of D Hy is £5 and for the degree £6 6s The regulations for examination for the Diploma in Public Health (D P H) are the same as those for the degree of Bachelor of Hygiene except that the candidate is not required to be a graduate in Medicine of a recognised University and the course of study need not be passed at Newcastle-upon Tyne The fee for the examination is £10 10s and for the diploma £3

Victoria University of Manchester —An examination in Public Health is held twice yearly The examination is in two parts and is written oral, and practical Candidates may present themselves for Parts I and II separately or at the same time provided that no candidate be admitted to Part II unless he has already passed in Part I No candidate s name will be published until he has satisfied the examiners in both parts of the examination. The fee for each part is £5 5*s*, and must be paid on or before July 1st in each year For any subsequent examination in the same part the fee will be £3 3*s* Every candidate who has passed both parts of the examination to the satisfaction of the examiners, and who is legally registered, will receive a Diploma in Public Health The examinations will begin about the end of March and the middle of July in each year Holders of the Diploma in Public Health are eligible for examination for the Certificates in School Hygiene and Factory Hygiene after attending the prescribed periods of study and hospital practice

University of Birmingham —The University grants a degree of B Sc in Public Health and also a Diploma in the same subject on the following conditions Graduates in Medicine of this University may become candidates for the degree of Bachelor of Science in Public Health by conforming to all the requirements laid down for candidates for the Diploma in Public Health, except that after graduating in Medicine all courses of study must be taken out in the University, and they must, in addition, have attended a three months' course of Geology in the University The examinations will be held in the months of March and June and will consist of two parts, each part being written, oral, and practical No candidate will be allowed to pass Part II until he has passed Part I Candidates may enter for Parts I and II separately or at the same time The fee for each part of the examination is £5 Medical Officers of the Royal Navy who have attended courses in Hygienic Chemistry, Bacteriology, and Public Health at the Naval Medical School, Greenwich, will be admitted to the examinations for the Diploma in Public Health, whether they have previously been students at the Birmingham School or not, and the same applies to officers of the Royal Army Medical Corps who have studied Chemistry and Bacteriology at the Staff College and pursued the further course of study approved by the General Medical Council

University of Liverpool —The University grants a Degree in Hygiene (M H) and a Diploma (D P H), and every facility is afforded for training in Sanitary Science and State Medicine The curriculum for the Degree extends over a period of two years, the first of which is devoted to laboratory instruction and practical classes (including those for the Diploma), the second being devoted to advanced study and research The D P H curriculum fees are Chemistry, £5 5*s*, Bacteriology, £5 5*s*, Practical Sanitation, £15, Infectious Diseases, £3 3*s* The courses may be taken out at any time, and students are allowed to work daily in the laboratories

The University grants a Diploma in Tropical Medicine Three courses of instruction are given every year Two of these last for three full months—the Lent Course from Jan 6th to April 5th and the Autumn Course from Sept 15th to Dec 13th The Third Course, an Advanced Course, lasts one month, from June 1st to the 30th At the end of each full course an examination is held by the University for its Diploma of Tropical Medicine (D T M), which is open only to those who have been through the course of instruction of the school The examination lasts three days and consists (1) of papers on Tropical Medicine, Tropical Pathology, and Tropical Sanitation and Entomology respectively, (2) of a clinical examination, and (3) of an oral examination The advanced course consists entirely of Practical and Clinical Laboratory Work, given at the laboratory at the University The fee for the full course of instruction is 13 guineas, with an extra charge of 10*s* 6*d* for the use of a microscope if required The fee for the examination is 5 guineas Applications should be made to the Dean of the Medical Faculty, University of Liverpool Two University Fellowships of £100 a year each are open to students of the school, amongst others Accommodation for research work is to be had at the University Laboratory The Mary Kingsley Medal is awarded by the school for distinguished work in connexion with Tropical Medicine The new laboratories are completed and ready for occupation on the termination of the war

University of Leeds —The University grants a Diploma in Public Health, and every facility is afforded for training in Sanitary Science and State Medicine. The examination, which is held twice in each year—namely, in June and December—is in two parts, and is written, oral, and practical Candidates, before entering for the first part of the examination, must have held for not less than 12 months a registrable qualification in Medicine, Surgery, and Midwifery, and must present satisfactory certificates of having attended an approved course of instruction in Public Health in the University, or in a college or medical school recognised for this purpose by the University Candidates before entering the second part of the examination must present certificates of having, after obtaining a registrable qualification, attended during not less than three months the clinical and administrative practice of a hospital for infectious diseases approved by the University Candidates may present themselves for Parts I and II separately or at the same time, provided that no candidate be allowed to pass in Part II unless he has already passed in Part I Fees—The fee for each part is £5 5*s*, and for any subsequent examination in the same part £3 3*s*

University of Sheffield —The examinations for the Diploma in Public Health are open to all registered medical practitioners who have completed approved courses of study The examination shall be in two parts The subjects of the examination in Part I shall be Chemistry and Bacteriology Candidates may present themselves for examination in the subjects of Part I either separately or at the same time The subjects of the examination in Part II shall be the General Principles of Public Health, with especial reference to Epidemiology, trade diseases, sanitation, inspection of articles of food, the storage and purification of water, and the principles of drainage Parts I and II *of the examination* may be taken separately or at the same time Courses of lectures and practical instruction in the subjects of the examination are given at the University These courses may be attended by students intending to become candidates for the Diploma in Public Health of other Universities

University of Bristol —Diploma in Public Health Candidates must be at least 23 years of age, shall be fully registered medical practitioners of not less than 12 months' standing as such, and shall have passed the examination prescribed by regulation The examination is divided into two parts The subjects of the First Part are Chemistry as applied to Public Health and Pathology and Bacteriology Candidates for the First Part shall, during six months after having obtained a registrable qualification, have received practical laboratory instruction in Hygienic Chemistry, in Bacteriology, and in the *Pathology* of the Diseases of Animals Transmissible to Man. The subjects of the Second Part are Public Health and Epidemiology, Sanitary Law, Vital Statistics, and Sanitary Reporting

University of Edinburgh —Two degrees in Science in the Department of Public Health are conferred by the University of Edinburgh—viz, Bachelor of Science in Public Health and Doctor of Science in Public Health A Diploma in Tropical Medicine and Hygiene is also granted. Candidates for the degree of B Sc in Public Health must be graduates in Medicine of a recognised University, and must pass two examinations, for the first of which they must, after graduation in Medicine, have worked for at least 20 hours per week during a period of not less than eight months, of which at least five consecutive months must be in the Public Health Laboratory of the University of Edinburgh and the remainder either there or in a laboratory recognised by that University, they must also have attended courses of instruction in Physics and Geology in some Scottish University Candidates are not admitted to the Second Examination sooner than six months after having passed the First Examination, nor sooner than 18 months after having taken their degree in Medicine and they must have attended two separate courses in Public Health in some University of the United Kingdom or in such medical school or Indian, Colonial, or Foreign University as may be approved for the purpose by Edinburgh University, each course consisting of 40 lectures at least, one of which courses shall deal with medicine and the other with engineering, each in its relation to public health The subjects of examination include Laboratory work, Physics Geology, Medicine in its application to Public Health, Sanitation, Sanitary Law, and Vital Statistics Graduates who have held the degree of B Sc in Public Health from the University of Edinburgh for a term of five years may offer themselves for the degree of D Sc. in Public Health in that University They must then present a Thesis and pass an examination in Public

Health The fees are £3 3s for the First and £3 3s for the Second B Sc Examinations, and £10 10s for the degree of D Sc

University of Aberdeen —The Diploma in Public Health (D P H) is conferred only on graduates in Medicine of a University in the United Kingdom not less than 12 months after medical graduation Every candidate must produce evidence of having attended, after graduation in Medicine, during a period of six months, practical instruction in Hygiene and Bacteriology in laboratories approved of by the University, together with having during six months (whereof three months must be distinct from the period of laboratory instruction) been diligently engaged in acquiring a practical knowledge of the duties, routine and special, of Public Heath administration under the medical officer of health of a county or large urban district. He must have regularly attended for three months the practice of a hospital for infectious diseases at which opportunities are afforded for the study of methods of administration He must also have obtained practical instruction in the drawing and interpretation of plans The diploma is conferred after an examination in Public Health held in March and July of each year The fee is £5 5s

University of Dublin (Trinity College).—The Diploma in Public Health is conferred, after examination, on the following conditions The candidate must be a registered medical practitioner and have obtained a registrable qualification at least nine months before the examination The candidate must have completed, subsequently to obtaining a registrable qualification, four months' practical instruction in a chemical and bacteriological laboratory or laboratories approved by the University, must have studied practically outdoor sanitary work for six months under an approved officer of health, and must have spent three months' attendance at a fever hospital where opportunities are afforded for the study of methods of administration A special prospectus and a list of recognised laboratories may be obtained by application to the Registrar of the School of Physic, Trinity College, Dublin

National University of Ireland —At this University there is a Diploma in Public Health and a B Sc in Public Health The Diploma may be granted to matriculated or non matriculated students of the University who shall have completed approved courses of study and shall have passed the prescribed examinations provided that it shall not be granted except to a registered medical practitioner Candidates may present themselves for the examination after an interval of not less than 12 months from the time of obtaining a registrable qualification The curriculum extends over a period of not less than nine calendar months Every candidate must produce a certificate that he has attended practical instruction in a laboratory, approved by the University, in Chemistry, Bacteriology, and the Pathology of the diseases of animals transmissible to man The examination consists of two parts, which may be passed separately or together Part I comprises the following subjects Chemistry, Meteorology and Climatology, and Sanitary Engineering and Architecture Part II comprises the following subjects Bacteriology, Hygiene, Sanitary Law, and Vital Statistics The examination in each part will be oral and practical as well as written

For the B Sc in Public Health a candidate shall not be admitted unless he (*a*) shall have received the degrees of M B , B Ch , and B A O at least one year previously, (*b*) shall have pursued an approved course of study in the Faculty of Medicine, and (*c*) shall have passed the prescribed examination In addition to D P H course the candidate will be required to take up (1) a Special Course of Pathology, (2) Bacteriology, and (3) Advanced Course in Hygiene Each of these courses lasts three months

University of Belfast —A Diploma in Public Health is given by examination Every candidate must produce evidence that, after obtaining a registrable qualification, he has during six months received practical instruction in an approved laboratory in which Chemistry, Bacteriology, and the Pathology of the diseases of animals transmissible to man are taught After obtaining a registrable qualification every candidate must produce evidence that he has attended during three months the practice of a hospital for infectious diseases at which opportunities are afforded for the study of methods of administration The examination must have extended over not less than four days, one of which shall have been devoted to practical work in a laboratory, and one to practical examination in and reporting on, subjects which fall within the special outdoor duties of a medical officer of health The examination will be held once yearly Part I in March, and Part II in June The first part of the examination will have reference to the general principles of sanitary science, and the second part to State Medicine and to the applications of Pathology and Sanitary Science The fee for each part is 1 guinea.

Royal College of Physicians of London and the Royal College of Surgeons of England —The following are the regulations for obtaining the Diploma in Public Health The examination consists of two parts The first part of the examination takes place in January, April, and July and the second part in January and July The fee for each part is £10 10s , except for those who are diplomates of the Royal Colleges, who pay £6 6s for each part A candidate intending to present himself must give 14 days' written notice to the Secretary, at the Examination Hall, Queen square, Bloomsbury, W C He will be admissible to examination in Part I on producing evidence (1) of having been in possession of a registrable qualification for at least 12 months , (2) of having attended thereafter practical instruction in a laboratory recognised by the Examining Board in England for at least 240 hours during a period of six months , and (3) of being at least 23 years of age A candidate will be admitted to Part II of the examination on producing evidence (1) of having been diligently engaged in acquiring a practical knowledge of Public Health administration during six months under certain specified conditions , (2) of having attended during three months the clinical practice of a hospital for infectious diseases , and (3) of being at least 24 years of age

The examination for the Diploma in the Diseases and Hygiene of the Tropics has been discontinued during the war

The Royal College of Physicians of Edinburgh, the Royal College of Surgeons of Edinburgh, the Royal Faculty of Physicians and Surgeons of Glasgow —All candidates for the Diploma in Public Health must have a qualification which has been registered under the Medical Acts Candidates must have attended not less than four calendar months' practical instruction in Chemistry and Bacteriology in a recognised laboratory or laboratories, must have studied outdoor sanitary work for six months under a medical officer of health or other sanitary officer , and must give evidence of attendance for three months at the practice of a Hospital for Infectious Diseases, at which he has received instruction in the methods of administration The examination consists of two parts, and candidates may enter for both at one period or for either separately The First Part includes (*a*) Laboratory Work (Chemistry and Bacteriology) (*b*) Physics and Meteorology , and the Second Examination embraces (*a*) Report on Premises visited, (*b*) Examination at Fever Hospital, (*c*) Examination at Public Abattoir (*d*) Written and Oral Examinations on Epidemiology and Endemiology, (*e*) Vital Statistics and Sanitary Law, and (*f*) Practical Sanitation. The fee is 12 guineas for both examinations, or 6 guineas for either of them A fee of 3 guineas is payable by rejected candidates for either examination The examination is held twice yearly, in May and October The published regulations provide detailed synopses of the subjects of examination The Registrar for Edinburgh is Mr D L Eadie, 50, George square, and for Glasgow Mr Walter Hurst 242 St Vincent-street

Royal College of Physicians of Ireland and Royal College of Surgeons in Ireland —Every candidate for the Diploma in Public Health must be a registered medical practitioner He must subsequently to qualification (1) receive six months laboratory instruction in Chemistry, Bacteriology, and the Diseases of Animals transmissible to man , and (2) during six months practically study outdoor sanitary work under a medical officer of health, and shall as an additional requirement attend a hospital for infectious diseases Candidates are examined on four days, commencing on the first Monday of February, May and November The examination comprises the following subjects —Hygiene, Chemistry, Meteorology and Climatology, Engineering, Vital Statistics Sanitary Law, and Bacteriology The fee for the examination is £10 10s For further particulars apply to Alfred Miller Secretary, Committee of Management , Office, Royal College of Surgeons, Dublin

Annotations.

"Ne quid nimis"

PLASTIC SURGERY IN PULMONARY TUBERCULOSIS

THE vogue of lung collapse therapy has stimulated the study of this subject, of the present state of which L Spengler[1] gives a critical survey Beginning with the work of Quincke (Bonn) and of Carl Spengler (Davos), who advocated rib resection to facilitate obliteration of chronic cavities, a real extra pleural thoracoplasty was first advocated by Brauer, in cases where the existence of pleural adhesions prevented or limited the induction of an artificial pneumothorax, and first carried out by Friedrich However, this "total" operation, besides being dangerous to life, left the thoracic wall too weak, the mediastinum flapped to and fro with the respiratory movements and circulatory disturbance was caused In order to avoid these dangers, Brauer (Hamburg) altered the plan of the operation He did not touch the tenth rib, so as to spare the attachments of the diaphragm, used local anæsthesia, and operated in two stages, compressing first the lower, and presumably more healthy, part of the lung, so as to lessen the risk of aspiration into it of sputum expelled from the apical and more diseased region This technique is the foundation of that now practised by Sauerbruch (Zürich) Sauerbruch also operates under local anæsthesia and in two stages, resecting the ribs behind ere—if that be needed—he divides them in front A paravertebral, longitudinal, hook shaped incision is used, and before closing the wound the vertebral border of the scapula is pressed under the proximal rib stumps, in order further to compress the lung Wilms's original "Pfeilerresektion" is condemned as insufficient the deviser himself has extended it until it amounts to a thoracoplasty Extra pleural thoracoplasty must, however, be suited to individual requirements, must always be preceded by an attempt to establish artificial pneumothorax, and is especially useful for basal cavities In a localised form, also, it is, of course, highly applicable to obliterate a tuberculous empyema or a partial pneumothorax space which, despite tapping, secretes chronically a thick effusion Other strictly surgical measures in use to obtain compression of (particularly apical) pulmonary tissue are pneumolysis and plugging Tuffier introduced the former procedure, resecting the second rib, and freeing extra-pleurally the pulmonary apex with a blunt dissector, and then maintaining its separation from the chest wall with nitrogen gas, or better, a fresh lipoma Baer (Davos) used as a plug paraffin vioform bismuth The drawback to plugging is, however, that the substance introduced, even a fatty tumour, may be expectorated after having ulcerated through the wall of the compressed cavity, also there is much risk of sepsis even with all care The former accident happened to Tuffier four times in 14 cases and to Sauerbruch seven times in 28 As for the more or less isolated adhesions often shown by radioscopy to limit the area of an artificial pneumothorax, these have been dealt with intrapleurally by ligature and division, and also by division with the cautery under observation with a thoracoscope They often contain caseous matter and largish blood vessels Saugman had thus a fatal case of hæmorrhage

SUBSTITUTES FOR SUGAR AND GLYCERINE

A SUGGESTION was made in THE LANCET recently that, in order to husband our inadequate supplies of sugar and medicinal glycerine, and at the same time to encourage uniformity in dispensing preparations which have hitherto contained one or other of these substances, prescribers should make it clear that they mean the prescribed medicines to contain no sugar or glycerine, as the case may be This suggestion has been adopted by the Committee which was appointed by the Home Office early in the war to consider economy in the use and distribution of drugs In a circular which has been issued to the medical profession the Committee recommends that wherever possible practitioners should order such preparations "*sine glycerino*" or "*sine sacchaio*" As a substitute for sugar as a sweetening agent a mucilage of tragacanth with chloroform (composed as follows gum tragacanth 30 grains, chloroform 40 minims, water to 10 fluid ounces) can be prescribed in suitable quantities It is worthy of note that the Pharmaceutical Society is preparing as a supplement to the British Pharmaceutical Codex a set of formulæ to replace those which have been withdrawn from the Pharmacopœia.

INSTRUCTION IN VENEREAL DISEASES

THE schemes for the diagnosis and treatment of venereal diseases now being undertaken by local authorities all through the United Kingdom are in most cases offering facilities for instruction in accordance with the recommendations of the Royal Commission on Venereal Diseases and at the express wish of the Local Government Board Circumstances have conspired to produce in the clinical schools a shortage of material on which clinical instruction in venereal diseases could be based, and the openings for both clinical and pathological work offered at the new treatment centres will be welcome to senior students and general practitioners No complete list of centres for the country generally is at present available, although few large urban areas will be without one, but in London the County Council and the City Corporation have arranged for the coöperation of certain hospitals, the complete list of which is as follows —

Charing Cross, Golden Lane (City of London), Great Northern Great Ormond street (ch), Guy's, King's College, Lock (91, Dean street, W C (m , w , ch), Harrow road, W (w , ch)), London, Middlesex, Miller General, New Women's, Royal Free, St George's, St John's (Leicester square), St Mary's, St Paul's (Red Lion square) St Thomas's, Seamen's (for merchant seamen only), South London for Women, University College, West London, and Westminster

A list of these institutions, excepting the Golden lane clinic at the City Shelter, 19–20, Golden lane which is under the City Corporation with the days and times at which the clinics are available for the use of patients, has been issued by the Public Health Department of the London County Council The pathological work of the clinic is done at the hospital to which each is attached with the exception of St Paul's Hospital and the Miller Hospital which are served respectively by the Royal Free Hospital and the Seamen's Hospital

Courses of instruction have also been held at the Military Hospital, Rochester Row, London, S W , under the direction of Lieutenant-Colonel L W Harrison, at which some hundreds of panel practitioners attended the lectures and subsequent practical demonstrations This instruction will be repeated in the coming winter if there is sufficient demand for it

IT is stated that the French Government is so satisfied with the work of the Army Medical Service its numerical importance, the quantity of its equipment, and the great scale on which it works, that the President has signed a decree declaring that it shall in future take rank with all the other branches of "the armed service"

---

The War.

THE CASUALTY LIST

THE following names of medical officers appear among the casualties announced since our last issue —

Killed

Capt R D B Frew, R.A.M C, qualified at Glasgow in 1903 and was tuberculosis officer to the County Borough of Wallasey, Cheshire, prior to joining up He formerly held appointments at the Monsall Hospital, Manchester, the Glasgow Royal Infirmary, and at the Manchester Hospital for Consumption

Capt F R Armitage, D S O, R A.M C, attached Royal Field Artillery, was educated at Cambridge University and at the London Hospital and qualified in 1903 Prior to joining up he was in practice at Wolverhampton The award of the D S O was recorded in THE LANCET of Jan 6th, 1917, p 37

Lieut A B Ross R A.M C, attached Royal Irish Rifles, qualified at Edinburgh in 1902, and was in practice at Ashton under Lyne prior to joining up He had held appointments at the Children's Hospital Great Ormond street, London, at the Royal Infirmary, Edinburgh, and at the Glasgow Maternity Hospital

Capt H Ackroyd, M.C R.A.M.C, was educated at Cambridge University and at Guy's Hospital London, and qualified in 1903 He had held appointments at the General Hospital, Birmingham, and at the David Lewis Northern Hospital Liverpool, and later took up research work at his university Prior to joining up in February, 1915, was residing at Royston Herts The award of the M C was recorded in THE LANCET of Oct 28th, 1916, p 769

Lieut. C M Atkinson, R A.M.C, attached Norfolk Regiment was a student at University College London, and qualified in 1896 Prior to joining up he was in practice at Ashford, Kent, where he was medical officer of the East Ashford Workhouse and Infectious Hospital

Died of Wounds

Capt R L Henderson, Australian A.M C, qualified at Edinburgh in 1903 and after holding an appointment at the Cumberland Infirmary, Carlisle he practised in Australia from whence he came with the Australian Expeditionary Force

Capt H D Willis R A.M C, attached Worcester Regiment, was educated at Manchester University, and qualified in 1912

Previously reported Wounded, now reported Died of Wounds

Capt C W Treherne, R A.M C, received his medical education at St Thomas s Hospital London, and qualified in 1912 He held appointments at the West London Hospital and at St Thomas s and was a medical officer of the British Red Cross Society during the Balkan War of 1912-1913

Died

Surg Capt R A Bostock R A M C, attached Scots Guards, was a student at St Bartholomew s Hospital, London and qualified in 1855 He joined the Army Medical Service in 1856 and was in retirement when he was re-employed for the war

Wounded

Capt W H Hart R A M C
Capt D J MacDougall, R A.M C attached Royal Sussex Regiment
Capt R P S Mason M C R A.M C, attached Royal Field Artillery
Capt C H L Rixon R A.M C attached Sherwood Foresters
Capt G F Graham I M S
Capt G A. Cole, R A M C
Capt O J Day M C, R A M C attached E Surrey Regt
Major J S Y Rogers D S O R A M C, attached Black Watch
Major S B Smith D S O R A M C
Capt A J Kearney R A M C
Capt H Alcock R A M C, attached Royal Warwickshire Regiment
Lieut G F Fismer R A M C
Capt A P Gray R A.M C attached Royal Field Artillery
Capt J F Rutherford R A M C attached Royal Irish Rifles
Cap I Edie N Z A M C

Missing

Capt C W Bond R A M C

CASUALTIES AMONG THE SONS OF MEDICAL MEN

The following additional casualties among the sons of medical men are reported —

Second Lieut F V L Claremont, Royal Garrison Artillery, killed in action, younger son of the late Dr C C Claremont of Southsea

Capt C W Treherne, R.A.M C, *died of wounds*, son of Surg Gen Sir F H Treherne K.C M G

Capt F R Armitage D S O, R.A.M C, attached Royal Field Artillery, killed in action, eldest son of Dr J A Armitage, of Hastings

Flight Lieut C V Arnold, R N, died, only son of Capt Arnold, R A.M C of the War Hospital, Dartford

Surg Capt R A. Bostock, R A M C, attached Scots Guards, died, son of the late Surg Gen J A. Bostock, C B

Lieut L C Burnett R N, killed in action second son of Surg Gen W F Burnett, A.M S, of Richmond, Surrey

Second Lieut A W Wilson, Scots Guards, killed in action, only surviving son of the late Dr W Wilson, of Hanley, Staffs

Capt the Rev G M Evans, M C, Chaplain to the Forces killed in action only son of the late Samuel Evans, M R C S, L.R C P, of Dovercourt, Essex

Capt A. S Solly, Royal Field Artillery, killed in action, son of Major E Solly, R.A.M C, of Harrogate, and formerly mayor of the town

Major (temp Lieut Col) E A B Alston, Northamptonshire Regiment, attached Duke of Cornwall's Light Infantry, killed in action, fourth son of the late Surg Major W E Alston, of Sandgate, Kent

THE HONOURS LIST

The following awards to medical officers are announced —

K C B

Lieut Col (temp Brig Gen) Auckland Campbell Geddes, C.B, Territorial Force Reserve, Director of Recruiting

Bar to the Distinguished Service Order

Capt Eric Dalrymple Gairdner D S O, R.A.M C

For conspicuous gallantry and devotion to duty He went forward under very heavy fire to attend to a wounded N C O and was himself shot down He has consistently displayed high courage and devotion to duty and his example has been an aspiration to all ranks

(The award of the D S O was announced in THE LANCET of June 10th 1916, p 1195)

Distinguished Service Order

Temp Capt (acting Lieut Col) Charles Derwent Pye Smith, M C, R A.M C

For conspicuous gallantry and devotion to duty When in charge of an advanced dressing station his sergeant-major and the whole of his staff were killed He reorganised the work with the assistance of a lance-corporal and in consequence of his energy and presence of mind the work was not delayed. He led his bearers continually into the front line rescuing wounded under heavy shell fire, and working with great heroism for 60 hours setting a splendid example to all

Lieut Col (Temp Col) Donald Johnstone McGavin, New Zealand, M C

For conspicuous gallantry and devotion to duty While acting as A.D M S to his division the successful evacuation of the wounded during our heavy offensive was due to the thoroughness of his preparations and his personal attention to the smallest details He went into the advanced area at great personal risk to encourage the stretcher bearers and superintend the removal of casualties setting a splendid example to all ranks

Bar to the Military Cross

Capt Samuel Russell Foster, M C, R A.M C

For conspicuous gallantry and devotion to duty He showed the greatest skill and fearlessness in leading his stretcher bearers through a severe enemy barrage to evacuate wounded from our front line. His work has always been marked by utter disregard of danger and his fine example has communicated itself to his men

(The award of the Military Cross was announced in THE LANCET of Nov 27th 1915 p 1217)

Temp Capt David Hamilton Hadden, M C, R.A.M C

For conspicuous gallantry and devotion to duty Under extremely adverse weather conditions he worked without rest for three nights and two days attending wounded Throughout he showed the utmost indifference to heavy shell and machine-gun fire

(The award of the Military Cross was announced in THE LANCET of Jan. 6th 1917 p 30)

Capt Frank Graham Lescher, M C, R A M C, Spec Res

For conspicuous gallantry and devotion to duty He showed the greatest skill and fearlessness by leading his bearer parties and establishing forward collecting posts under heavy hostile shell fire He worked ceaselessly for three days by his personal example and devotion inspiring his men with courage under very difficult conditions

(The award of the Military Cross was announced in THE LANCET of Oct 28th 1916 p 770)

Military Cross

Capt Arthur Stanley Addison, New Zealand M C

For conspicuous gallantry and devotion to duty During an attack he established his dressing station and worked with the greatest devotion under heavy shell fire dealing with a great many wounded from all units in his vicinity

Capt William Aitken, New Zealand M C

For conspicuous gallantry and devotion to duty He repeatedly took his bearers through heavy hostile barrage clearing the aid posts and searching shell holes for wounded His gallantry and coolness under fire were of the highest order and a splendid example to his men

Temp Lieut Ernest Francis Rimington Alford, R A M C

For conspicuous gallantry and devotion to duty He has on all occasions shown the greatest courage and disregard for danger when attending wounded under fire and in many cases in the open

Temp Capt Charles Bannigan, R A M C

For conspicuous gallantry and devotion to duty A dug-out having been blown in at some distance from his aid post he ran to the spot at great personal risk under heavy shell fire and attended to the wounded saving one man s life His conduct on all occasions has been marked by the greatest courage and devotion

Temp Capt David Sands Brough, R A.M C

For conspicuous gallantry and devotion to duty He worked unceasingly when in charge of two bearer subdivisions Under very heavy fire he again and again led his bearers to the wounded setting a fine example to all

Capt John Cook, R A M C

For conspicuous gallantry and devotion to duty He went out under heavy shell fire attended to the wounded and carrying them to cover and setting a fine example of fearlessness and devotion

Capt Alexander Cosgrave Court, R A M C , Spec Res

For conspicuous gallantry and devotion to duty in establishing an advanced aid post and personally attending to all the wounded under heavy fire Though wounded in the hand, he carried on saving many lives and showing great courage and initiative on this as on all other occasions

Temp Capt Eric William Craig, R A M C

For conspicuous gallantry and devotion to duty During the night he repeatedly led the bearers beyond our front line under heavy fire By his example and courage he was the means of rescuing many wounded

Capt James Garfield Crawford, New Zealand M C

For conspicuous gallantry and devotion to duty He repeatedly took his bearers through heavy barrage bringing back many wounded who were lying exposed to the enemy's fire His coolness and fearlessness under heavy fire were a striking example to his men and his energy was the direct cause of many lives being saved

Capt Harry Edmund Creswell, R A.M C , Spec Res

For conspicuous gallantry and devotion to duty When casualties were very heavy he worked single-handed for 36 hours without rest. Throughout he showed complete disregard for his own personal safety

Temp Capt Alexander Dick, R A M C

For conspicuous gallantry and devotion when in medical charge of the regiment during an attack He was forced to establish his aid post in an open trench where he carried out his duties for two days and one night under heavy shell fire and in terrible weather He never left his post except to attend to wounded who could not be brought in and it was owing to his energy and heroism that the wounded were safely removed from the battlefield

Capt William Fotheringham, R A M C , Spec Res

For conspicuous gallantry and devotion to duty Finding no suitable position for an aid post in the captured lines, he established one in an open trench where he attended to the wounded for four days and nights under constant shell and gas-shell attack His courage and devotion set a fine example to all those working under him

Capt Charles Marsh Gozney, R A.M C

For conspicuous gallantry and devotion to duty in attending to the wounded under heavy shell fire By his courage and total disregard of personal danger he set a brilliant example to all around him and greatly encouraged the wounded

Temp Capt Ernest Eugène Herga, R A M C

For conspicuous gallantry and devotion to duty When in command of an advanced bearer post he displayed the greatest gallantry and skill in bringing the wounded through heavy hostile barrage twice crossing the open under machine-gun fire to rescue wounded men By his skilful organisation and great personal courage under fire the evacuation of the wounded was efficiently carried out

Capt Noel Edmund Barton Kirkwood, Australian A.M C

For conspicuous gallantry and devotion to duty He worked continuously for 90 hours attending wounded under heavy shell fire He set a most inspiring example to those around him

Temp Capt George Robertson Lipp, R A.M C

For conspicuous gallantry and devotion to duty He organised a party of bearers and went out under heavy shell fire and repaired the road which had become impossible for ambulances Later when his post was heavily shelled he remained and attended all wounded in the vicinity thus setting a splendid example to all

Capt Archibald McCausland, Canadian A M C

For conspicuous gallantry and devotion to duty At great personal risk he crawled through a small opening into a dug-out which had been blown in by hostile shell fire dressed the men there and afterwards attended to all the wounded in the locality under continuous heavy shell fire His courageous action saved the lives of several wounded men

Temp Capt Hugh Ross Macintyre, R A M C

For conspicuous gallantry and devotion to duty when in command of a bearer party He led his men repeatedly through heavy hostile barrage until all the wounded had been carried into safety He was fearless in the place of danger and by his coolness and courage he showed a splendid example to his men.

Capt Laurence Abel Mackenzie, R A.M C

For conspicuous gallantry and devotion to duty Whilst at work in a dressing station a shell came through two roofs killing and wounding five out of his party of six. Though severely shaken himself he organised the dressing station and carried on with the work under very heavy shell fire for two days showing a magnificent example of grit courage and devotion to duty under exceptionally trying circumstances

Capt Gordon Archibald Macpherson, Canadian A.M C

For conspicuous gallantry and devotion to duty in collecting and tending the wounded under heavy shell-fire His promptness and devotion in collecting stretcher cases in dug-outs when it was impossible to evacuate them at once undoubtedly saved many lives

Temp Lieut Robert Beattie Martin, R A.M C

For conspicuous gallantry and devotion to duty He showed the greatest gallantry in attending to the wounded under very heavy fire at a moment when the enemy had turned machine-guns on to them. He displayed the utmost fearlessness and skill in getting most of them away to a place of safety

Temp Capt James McDonnell, R A.M C

For conspicuous gallantry and devotion to duty When the village was being shelled a number of men were buried and badly wounded He superintended a party and worked for three-quarters of an hour and succeeded in rescuing them This task was carried out under continuous shelling

Capt Arthur Dysant Nelson, New Zealand M C

For conspicuous gallantry and devotion to duty He remained for three days continuously on duty under very heavy shell fire attending to the wounded of his own and many other units Owing to his advanced position and untiring energy many lives were saved.

Temp Capt Thomas Holmes Ravenhill, R.A.M C

For conspicuous gallantry and devotion to duty in collecting and evacuating wounded under heavy shell fire notably during a gas attack when his coolness and judgment saved very many casualties.

Temp Capt David Henry Russell, R A.M C

For conspicuous gallantry and devotion to duty when in charge of a bearer division He showed the greatest energy and complete disregard for personal safety in his untiring and successful efforts to locate the wounded and to attend to them His devotion saved many lives and on many occasions he has displayed the same gallantry under fire

Capt John Fox Russell, R A M C

For conspicuous gallantry and devotion to duty He showed the greatest courage and skill in collecting wounded men of all regiments and in dressing them under continuous shell and rifle fire.

Temp Capt Laurence Lancaster Satow, R A M C

For conspicuous gallantry and devotion to duty He established a dressing station within effective range of the enemy's position, where he attended to the wounded throughout the day and the following night under fire the whole time It was entirely owing to his disregard of danger and his devotion to duty that many of the wounded were collected and evacuated.

Capt Andrew Harvey Cameron Smith, Canadian A.M C

For conspicuous gallantry and devotion to duty Following his battalion closely in its attack he displayed the greatest courage and skill in establishing aid posts at the nearest possible points regardless of his own personal safety Though his posts were frequently under heavy shell fire the completeness of his medical arrangements, and the quickness with which aid was available, proved invaluable to the wounded His work at all times has been marked by the same devotion and gallantry

Capt Henry Joste Smith, R A M C

For conspicuous gallantry and devotion to duty He followed his battalion in the attack and attended to the wounded all day and night under very heavy fire of every description It was due to his courage and splendid devotion that so many of the wounded were brought in

Capt Ernest Talbot, R A M C , Spec Res

For conspicuous gallantry and devotion to duty as battalion medical officer Having established his aid post in a shell hole which was under direct hostile observation, he carried out his work under very heavy fire, showing wonderful organisation in his evacuation of the wounded

Capt Robert Taylor, R A M C , Spec Res

For conspicuous gallantry and devotion to duty in establishing bearer posts and an advanced dressing station under heavy shell fire It was due to his excellent arrangements that all the wounded were attended to and evacuated with the utmost regularity and despatch

Lieut Arthur Gerald Phillips Wills, R A.M C , Spec Res , attached Cheshire Regiment

For conspicuous gallantry and devotion to duty He remained at his aid post under heavy shell fire for 18 hours without rest, by his gallantry and fine example encouraging his bearers to work continuously until the last case was safely evacuated

Asst Surg John Wilson Woodsell, I S M D

For conspicuous gallantry and devotion to duty He displayed great courage and determination in tending the wounded under very heavy fire His devotion to duty saved many lives

MENTIONED IN DESPATCHES

The names of the following medical officers are mentioned a despatch, dated from the War Office, August 15th 1917, ceived from Lieut Gen Sir Stanley Maude, K C B, ommander in Chief of the Mesopotamian Expeditionary orce —

Parliamentary Intelligence.

NOTES ON CURRENT TOPICS

The Parliamentary Recess

BOTH Houses of Parliament rose for the Autumn Recess on Tuesday, August 21st The Session will be resumed in October

HOUSE OF COMMONS

WEDNESDAY, AUGUST 15TH

Invalided Officers of the Indian Medical Service

Answering Sir J D REES, who asked when the new rules would be issued regarding the position of officers in the Indian Army who when invalided from active service were after three months placed on furlough pay, Mr MONTAGU (Secretary for India) said An agreement on this subject has now been reached with the War Office Officers of the Indian Army and Indian Medical Service (other than those under staff leave rules) invalided from field service will receive full pay of rank and full staff pay during the first three months, and thereafter for the next six months or for the period of their leave, whichever may be shorter full pay of rank and half staff pay of their substantive regimental or departmental appointment The new rule will take effect from Feb 17th, 1917, and officers then on leave will benefit from it

Military Hospitals in India

Mr MONTAGU informed Major DAVID DAVIES that the outbreak of the war prevented effect being given to the recommendations of the committee which under the presidency of Sir P Lukis prepared a detailed scheme for the introduction of the station hospital system for Indian troops It had now been definitely decided to introduce the station hospital system for Indian troops at the earliest possible moment For British troops in India the system had been in existence for many years

Manufacture of Artificial Limbs

Answering Major KERR-SMILEY, Mr BARNES (Minister of Pensions) stated that action was being taken to obtain details of a new process known as "Dr De Page's system for making artificial limbs" which had recently been adopted at the Belgian hospital at La Panne, and when full particulars were to hand—as it was expected they would be shortly—the matter would be considered as to whether it was advisable to apply the process to the manufacture of limbs in this country and take advantage of Dr De Page's and the Belgian authorities very kind offer to train disabled soldiers in the process of manufacture

Deductions from Pay of Naval Surgeons

Mr HOHLER asked the Secretary to the Admiralty whether, after the consideration that had now been given to the position and contracts of naval surgeons who had retired before the war with a gratuity and placed their names on an emergency list, he could state what the decision of the Admiralty was, and whether the deduction would be discontinued and the deductions made refunded —Mr MACNAMARA said in reply It has been decided not to make deductions in future from the pay of naval surgeons who had retired before the war with a gratuity and placed their names on the emergency list and that deductions already made from the pay of such officers shall be refunded

Outbreak of Typhoid in Carmarthenshire

Major DAVID DAVIES asked the President of the Local Government Board whether his attention had been drawn to the outbreak of typhoid in the Tumble district, Carmarthenshire, and to the unsatisfactory conditions of housing or sanitation in that area, and whether he would cause a public inquiry to be held with respect to the causes of this and other epidemics that frequently occurred in the locality —Mr HAYES FISHER wrote in reply One of the medical inspectors of the Local Government Board has visited the district and spent a considerable period in closely investigating this outbreak and conferring with the parties concerned He has reported that the outbreak was caused by infected milk, and he has advised the district council as to action to be taken to prevent the disease recurring The action which has been taken is, I think, likely to be more useful than a public inquiry in a case of this kind

THURSDAY, AUGUST 16TH

The Administration of the Royal Army Medical Corps

Major DAVID DAVIES asked the Under Secretary of State for War whether he could state the names and the terms of reference of the committee to be appointed to inquire into the administration of the Royal Army Medical Corps —Mr MACPHERSON replied Not at the present moment Certain people are being approached, but until their answer is received no statement can be made

Mr WATT Will the honourable gentleman see that members of this House are appointed on this committee, and will it apply to all theatres of war?—Mr MACPHERSON No I made it quite clear that the terms of reference would apply only to the largest theatre of war—namely, France I will put my honourable friend's first suggestion before the Secretary of State for War

FRIDAY, AUGUST 17TH

Medical Examinations in the Army

In the course of the debate on the motion for the autumn recess, Mr SHORTT asked the Under Secretary for War what was to be done about the recommendations contained in the special report of the Select Committee on Medical Examinations —Mr MACPHERSON stated that the matter was out of the hands of the War Office now and was being dealt with by the War Cabinet, who hoped to be able to state in a short time what action was being taken

OUR CURRENT NUMBER

Being almost exclusively devoted to information especially interesting to Students we are necessarily compelled to defer the publication of communications on other important subjects

We tender our best thanks to those gentlemen who have at considerable personal trouble kindly supplied us with the returns and prospectuses upon which the information given in this Students' Number of THE LANCET *relative to the various medical examining bodies hospitals and medical schools of the United Kingdom is based We regret that in some cases however owing to proofs having been either not returned at all or too late certain inaccuracies may be found.*

MANAGER'S NOTICES.

VOLUMES AND CASES

VOLUMES for the first half of the year 1917 are now ready Bound in cloth, gilt lettered, price 21*s* , carriage extra

Cases for binding the half year's numbers (inland edition) are also ready Cloth, gilt lettered, price 2*s* 6*d* , by post 2*s* 10*d*

To be obtained on application to the Manager, accompanied by remittance

Milroy Lectures

ON

MEAT INSPECTION,

WITH SPECIAL REFERENCE TO THE DEVELOPMENTS OF RECENT YEARS

Delivered before the Royal College of Physicians of London

BY WILLIAM J HOWARTH, M D MANCH, D P H,
MEDICAL OFFICER OF HEALTH CITY OF LONDON

LECTURE III.[1]

IMPORTED MEAT

MR. PRESIDENT AND GENTLEMEN,—The annual amount of flesh meat consumed per head of the population was about 131 lb in pre-war times, of this, 59 per cent was home killed and 41 per cent. imported The division[2] of 126 lb of this total shows that in the case of beef and veal 40 3 lb was home killed and 23 3 lb imported, in the case of mutton and lamb the respective figures were 15 7 and 12 7 lb, and for pork and pig products 19 9 and 14 0 lb A comparison of the figures of the last ten years shows a tendency to increased consumption of mutton and lamb, in which the increase is mainly noted in the imported variety, and a definite reduction in the consumption of the flesh of the pig, the figures for 1900–03 showing a total consumption of 42 5 lb per head against 33 9 lb in 1912–13 The greater portion of this reduction was in the imported variety the amount of which in the years stated declined from 21·5 lb to 14 0 lb

The increased consumption of imported meat has been in progress for many years, but the character of the supply has undergone a change Prior to 1892 continental countries, chiefly Holland Denmark, and Germany, imported largely both live cattle and sheep, and cattle were received from the United States in considerable numbers The year of maximum importation was 1890, when 642,747 live cattle and 1 065 470 live sheep were imported This is in marked contrast with the year 1913, when only 12 000 cattle and less than 1000 live sheep entered the country

This decrease has resulted from orders prohibiting the importation of live animals for preventive reasons Importations from the continent were forbidden in 1882, but for some time after this cattle were permitted to be landed for slaughter from the United States Canada and the Argentine In 1900 the ports were closed to Argentine cattle, and to-day the landing of live cattle is regulated by the Foreign Animals Order of 1910, by which the landing of live animals is prohibited from the Argentine, Austria, Belgium Bolivia, Brazil Cape Colony, Chili Columbia, Denmark Ecuador France Germany, Gibraltar Greece, British, Dutch and French Guiana, Italy Malta and Mexico Natal Paraguay Portugal Russia, Sweeden, Uruguay and Venezuela The landing of swine is also prohibited from the United States Animals from countries not on the prohibited list may only be landed at Liverpool (Birkenhead) London (Deptford) Glasgow (Merklands) Bristol (Avonmouth) Cardiff (Bute Docks), and Manchester (Old Trafford)

In the United Kingdom the population during the decennium 1901–11 increased at a greater rate proportionately than did cattle and sheep, but at a lesser rate than did pigs This fact, in association with the prohibitions mentioned, might have been serious had no other way of supplementing the supplies than by means of live animals been available Discoveries, however, in connexion with the practical application of refrigeration to the meat industry proved the saving factor

In 1861[3] freezing works had been established at Sydney, New South Wales and at a luncheon on Sept 2nd, 1875, the guests were served with meat which had been kept from the June of the previous year In 1876 the *Northam*, a sailing ship fitted with freezing plant, attempted a trial shipment of frozen meat to England The venture was a failure, as the ship never started on the voyage owing to mechanical difficulties arising T C Eastman shipped the first consignment of chilled American beef to London in 1875, but various subsequent attempts to transport meat from Australia to London resulted in total failure or only partial success The *Paraguay* successfully carried 80 tons of mutton from South America to Havre in 1878, and the s s *Strathleven* successfully carried 40 tons of beef and mutton from Australia to London in 1879 Since then progress has been rapid

A summary table (XIII) will indicate the amount of meat received from the chief exporting countries engaged in the trade The figures given represent thousands of hundredweights

TABLE XIII.

Year	North America	South America	Australasia	Europe	Other countries	Total
1901	14 517	2171	2661	2470	0	21 819
1906	12,224	4511	2782	2621	0	22,139
1911	5 274	8913	4688	3476	24	22,375
1913	3 283	9640	5933	3965	10	22,831

Some idea of the actual class of meat imported and the different class of trades carried on by the various countries will best be seen from facts arranged in tabular form In Table XIV the totals are given in hundredweights for the year 1913 the information being obtained from official sources.

TABLE XIV —*Amounts of Various Classes of Meat Imported from Different Countries in 1913 (The totals represent cwts)*

Exporting country	Beef		Mutton.	Pork		Hams.	Bacon	Rabbits	Preserved otherwise than by salting	Unenumerated
	Fresh or refrigerated	Salted.		Fresh or refrigerated	Salted					
Australia ...	1 311 643	—	1 661 763	372	—	—	—	405,223	299 658	60 717
New Zealand	244 062	—	2,193 674	2,253	—	—	—	61 8[illegible]2	19 794	17 849
U S A ..	932	35 609	—	12,014	36 595	732,961	1 742,609	—	67 802	82,128
Argentina ..	6,996 696	—	1 405 632	—	—	—	—	—	154,710	313,747
Netherlands ..	1 951	—	123 048	464 204	—	—	185 215	11 636	4 562	208,932

It is obvious that a trade in food intended for human consumption of such magnitude and presenting features distinct from the trade in home killed meat would require special administrative measures to control it The special features include the results of conveyance over long distances, the influence of diseases peculiar to the country of origin, the utilisation of scraps of meat and the exportation of small unrecognisable portions which cannot be submitted to satisfactory examination in this country, the exportation of meat from which the bones have been dissected to save cost of freight, the exportation of edible offal and the character of meat which is canned or preserved in some other way before export

These facts indicate that a special system was needed and the exporting countries have generally recognised the necessity of supervising the meat before export to effect which they have instituted State inspections carried out by State appointed officials

In this country the Foreign Meat Regulations were framed and put into operation on January 1st 1909 Under these regulations foreign meat is classified into four groups—viz., Class 1 which includes (*a*) fresh, frozen or preserved meat which cannot be identified with parts of a carcass, an exception being made in the case of meat made up into sausages or some other recognised food product, (*b*) tripe, tongue, and kidneys contained in certain specified preservatives, (*c*) severed parts of a pig not bacon or ham, if not accompanied by an official certificate (this certificate has already been referred to), (*d*) severed parts of a pig in the form of bacon or ham if the lymphatic glands have been removed and if not accompanied by an official certificate, and (*e*) meat, whether from cattle or pigs, if it includes the ribs from which the pleura has been removed Class 2 includes only the entire carcass of a pig imported without the head in the natural state of attachment, or from which the lymphatic glands have been removed Class 3 includes meat in the form of severed parts of the carcass of a pig or other edible parts which does not comprise meat of Classes 1 or 2, and which is accompanied by an official certificate "Unclassed meat" is any other foreign meat not included in Classes 1, 2, or 3 Of the above groups, the meat included in Classes 1 and 2 is not allowed to be discharged for sale in this country, meat of Class 3 is approved, subject to being satisfactory on general grounds, whilst "unclassed meat" is submitted to the ordinary routine of inspection

---

[1] Lectures I and II were published in THE LANCET of August 4th (p [illegible]) and 11th (p [illegible]) 19[illegible]

[2] Report o Board of Agriculture and Fisheries Vol XLVIII Part IV (Cd. 7551)

[3] A History of the Frozen Meat Trade By J T Critchell and J Raymond 1912

Definite reference in these regulations is therefore made to scrap meat and unrecognisable cuts, certain edible offal, pig carcasses, and forequarter meat stripped of the pleural lining The latter requires no further reference beyond stating that stripping of the pleura often means the removal of evidence of tuberculosis The references to the pig merely ensure that the carcass shall have been examined prior to exportation and certified to be fit for human consumption in cases where the whole carcass is not available for examination in this country, and the prohibition of removal of head or glands prevents evidence of disease being removed before exportation In the case of scrap and boneless meat a few additional observations are necessary

BONELESS AND CANNED MEAT

The least satisfactory part of the inspection of imported meat—i e satisfactory to the home inspector—is that relating to boneless meat and canned meat Scrap meat and trimmings, which are now rightly excluded from importation, were formerly received in barrels or bags, and included neck meat and rib meat cut into small pieces Boneless meat does not necessarily come within the category of scrap meat, for so long as it can be referred to a definite part of the carcass it is grouped as "unclassed meat" Ready and certain recognition of a joint has an important bearing on inspection, for unless an inspector can with certainty refer a piece of meat to a definite part of the carcass he is handicapped in his decision as to the matters to which his attention should be directed He must have a mental image of the characteristics of normal meat from that area, remember the glands to be searched for, and know whether it is a piece which carries a serous membrane This boned meat should therefore, be cut in sufficiently large pieces to show definite anatomical relationship, there must be as little mutilation as possible in removing the bones, serous membranes must not be removed, and the glands of the part left *in situ* and if possible, so positioned that they may be readily found Attention must be paid also to the packing They must be packed so as to retain as far as possible their normal shape without folding or rolling and each piece should be frozen separately

Granted that all these requirements are complied with, the position still remains unsatisfactory, and the fullest confidence requires to be placed in unknown inspectors Meat so forwarded is generally from poor quality animals, no offal is available to assist the inspector, the general appearance presented by the carcass as a whole is lacking, and much has to be taken on trust The majority of pieces are examined in the frozen state, as only a few may be thawed owing to the deterioration which follows the process even if re frozen A somewhat similar position confronts the inspector when examining tins of canned meat Little more can be done than ascertain that the contents are sterile Diseased conditions have occasionally been found by careful search of canned meat, but inspection for this purpose is not practicable It is also more probable that a "plainer" class of meat and perhaps scraps, the importation of which is prohibited in the fresh state, may be used for canning

For these reasons, and also to assist in other branches of the inspection of foreign meat, such as the oversight of the sanitary condition under which the different processes are conducted and to ensure that the regulations are observed, I consider that the Government should appoint expe inspectors to make periodical visits to the foreign abattoi and food preparation places from which food products a exported to this country It is stated in the last report the Chief Inspector of Foods to the Local Government Boa that two inspectors of the Board have been lent to the Arm to supervise the foreign canned meat supplied to the force A similar safeguard should be continued after the war in th interests of the civilian population

GENERAL OBSERVATIONS RELATING TO IMPORTED CARCASS MEAT

Carcasses arrive in this country either in the frozen c chilled state Frozen meat has been submitted to a con tinuous temperature of about 15° F, and is therefore froze solid Chilled meat has been exposed to a temperature onl 1° or 2° below freezing point, and is therefore ready for sal immediately it is removed from the chilled room It is no necessary to justify the statement that both chilled an frozen meat constitutes a satisfactory article of die which is but little, if any, inferior to the home kille variety either in the relative amount of nourishment i contains or in digestibility It is possibly somewha more digestible than the recently slaughtered home variety, since it has been satisfactorily proved that the maturation or ripening process slowly operates whilst the carcass is in the chilled condition and perhaps even whilst in the frozen [4] The chief differences between home-killed and imported meat are due to physical changes the result of the process to which the meat is subjected. Apart from the details of dressing the carcass, chilled meat may differ very little from that of home killed It is more readily distinguished from frozen meat, but this distinction becomes progressively less if the temperature to which it has been exposed has been lower than 29° F The fat of chilled meat often assumes a pinkish hue owing to staining with the meat juices, which compares with the yellowish white colour of the fat of home-killed carcasses There is also some roughening of the tissues due to the friction of transportation The bundles of meat fibre assume a dull slate colour and on section the meat shows some excess of moisture which is most apparent on pressure These are really refinements of distinction, and it requires a very skilled person to state with certainty in some cases that a small joint is from a chilled carcass and not from a home-killed animal

Frozen meat is more readily recognised The carcass presents an unfinished appearance, the fat is dead white in colour, rigid, and in varying degree rough and ragged. Unless previously thawed the outside of the carcass will be found covered with moisture condensed from the atmosphere On section the muscular tissue will be found uniformly light in colour, which gives it a washed-out appearance It is moister than either home killed or chilled meat, and the extent of this exudation will depend upon the care displayed in thawing The exposed surfaces of the sawn bones are white in frozen meat, whereas in chilled, if from young good quality animals, they may retain the rose-tinted appearance of home-killed animals

The chief objections to these refrigerated carcasses are that the moist condition of the flesh and the previous process of maturation which they have undergone render them liable to putrefactive changes sooner than home killed carcasses, and in the case of frozen meat that the thawing process unless satisfactorily performed results in the loss of much of the valuable meat juices

The first of these objections is countered by ordinary methods of administration. The wholesale butcher keeps his supply in cold stores until he requires it for transmission to the retailer, and the retailer simply buys what he knows he can sell in the period during which the meat keeps in satisfactory condition or he may have a refrigerating chamber in which he keeps his stock, only bringing out his supply for sale as he requires it

The loss of meat juices from frozen meat is of greater importance but a knowledge of the circumstances which cause it will undoubtedly lessen the risk. It has been stated that in the process of freezing, the muscular fibres are lacerated by the ice spicules which form, and that on thawing, the moisture which exudes is due to the escape of the liquid contents of the muscle fibres This, however, does not appear to be the case Richardson[5] has satisfactorily shown that the water freezes outside the cell and not inside The ice thus formed occupies as much or more space than did the muscle fibres, and these as a consequence of the freezing process become isolated and distorted If meat in this condition be quickly thawed, the fibres are not able to re-absorb the liquid as quickly as it reassumes the fluid state, and therefore it exudes from any cut surface On the other hand, if the thawing is done slowly a considerable amount of the juice is reabsorbed and the extent of the moisture observed on the cut surface of a thawed joint depends upon the completeness or otherwise of this reabsorption The rapidity of reabsorption depends to some extent on the temperature at which the meat has been carried. At very low temperatures considerable distortion of the fibres results and they do not so easily regain their shape as those which have been frozen at higher temperatures The practical application of this fact is that meat carried at very low temperatures should be thawed much more slowly than that carried at higher temperatures

---

[4] M Muller: Zeitschrift für Fleisch und Milch Hygiene 1903-4, p 217

This question of permanent damage to the muscular fibres is obviously of some importance, since loss of fluid means loss of valuable proteids, extractives, and salts Fortunately there does not appear to be permanent damage, and, as suggested by Richardson, the process seems analogous to that which takes place when plants are frozen, in which case water freezes outside the cell in a state of considerable purity and not within Such freezing does not necessarily kill the plant, especially if the subsequent thawing is slow Experiments on animals would also indicate that the freezing of animal tissue does not necessarily result in serious damage to the cellular elements, or death would ensue in those cases where fish frozen in ice and submitted to a temperature of – 15° C , and frogs frozen in ice, have regained their vitality on slowly thawing

It follows, therefore, that the defrosting process should be conducted with due regard to the above requirements, and although many attempts have been made to devise mechanical means which would prove satisfactory, such as forcing air by means of a fan through the thawing rooms at progressively increasing temperatures, or the removal of frost and moisture by heated pipes, traders generally do not favour special means, since they take a few days to carry out and add to the cost of the meat In the Nelson system the cold pipes of the ammonia expansion process provide a surface on which moisture is deposited, and steam pipes are used to generate the necessary warmth to thaw the carcasses The steam pipes are placed under gratings in the floor and the cold pipes behind screens on the side walls The space behind the screen is open above and below Hot air rises between the carcasses, and a current is established which results in the warm moist air passing over the cold pipes The moisture is deposited on the pipes in the form of snow, and the cold air falls to be re-warmed by the hot pipes and again rises between the carcasses Meat thawed by this process is certainly dry and of good colour

THE REGULATION OF COLD STORES

In view of the fact that imported meat arrives in this country in shiploads, and that the supply is therefore often larger than that required for immediate sale, it is necessary for traders to provide themselves with cold stores in which the meat may be kept in condition until it is required for sale The increase in the number of cold stores is a feature of the present-day wholesale meat trade Many large retailers have also equipped themselves with this desirable accessory In many instances the management of these stores leaves nothing to be desired , in others however considerable improvement could be effected

Sanitary supervision is becoming increasingly a matter of importance Dirt or unsuitable substances deposited in cold stores results in objectionable consequences just as surely as do similar conditions in premises devoted to the storage of fresh meat The necessity for supervision is greater in public than in private stores Public stores may be used on the basis of separate parcels being deposited and a change made varying with the bulk and nature of the goods brought in, or stores may be subdivided and larger or smaller compartments given over for private use by special arrangement When many persons use a store there cannot be the same care displayed as when the stores are under single administration The common use of stores does not tend to improve either cleanliness or the maintenance of regular temperatures

Cold stores should be well lighted by electric means , not only for supervision, but to enable work to be done under the best conditions Some differentiation of goods deposited is also necessary Mixed goods such as poultry, eggs, fish, cheese, and the like should not be placed in compartments containing meat, and in meat stores the drier carcasses should be separate from the moister offal Provision should be made for adequate drainage or for frequent removal of offal drainage

Goods which are deposited in the stores should be in such a state that they are fit for refrigeration Putrefaction is considerably masked by freezing, and no goods except absolutely fresh material free from any mustiness should be admitted In addition, the removal of frozen goods for sale and the consequent thawing should be sufficient to justify objection being taken to the readmission of such goods with only rare exceptions This matter of admission of products into stores, and the fact that freezing masks decomposition, demand that definite responsibility shall devolve upon someone to ensure that stores are used in a proper manner, and to safeguard the public against cold stores being used to help in getting rid of products which are in an unsatisfactory condition How far responsibility attaches at present to other than the owner of unsound goods so deposited is not clear, but in public stores in which odd products are deposited it seems reasonable to require that the proprietors should be equally responsible with the owner of the goods as regards their condition, and where separate compartments are reserved the sub tenant should be responsible for his own goods, and likewise be joined in any responsibility which may devolve upon an owner to whom he grants facilities to store goods in his compartment

It would much help local authorities if definite regulations were framed dealing with these and other matters and perhaps annual registration of ownership of cold stores, with submitted lists of sub-tenants in places where compartments are hired, would prove of service Registers should be kept of the date of all goods admitted and discharged, and such should be available for inspection by the sanitary authority In certain of the United States a time-limit is placed by law on the period during which goods may remain in cold stores In certain instances provision is made for extension of the time, in others the period is absolute In some States, also, all goods are required to be stamped with the date of admission In the present position of our knowledge, it is impossible to fix a period beyond which retention in store should justify destruction and which would operate equitably all round As regards stamping the goods, there is perhaps something more to be said in favour, but it cannot serve any very practical purpose , probably the fact that it would indicate that goods were deposited in season is the best reason A register of admissions and discharges would meet most of the sanitary requirements and present no administrative difficulty Free admission to the stores and to the different compartments and passages should at all times be granted to authorised sanitary officers

THE INSPECTION OF IMPORTED CARCASS MEAT

As in the case of imported edible offal and boneless meat, inspection as to "condition" is a more essential requirement in the case of carcass meat than is the subject of disease By condition is meant not the qualities which the breeder considers when deciding whether an animal is fit for slaughter but the condition of the meat on arrival in this country It is obvious that if the temperature to which the meat is exposed has been allowed to rise above a point at which decomposition changes may take place, the meat may be rendered either wholly or in part unfit for human consumption Condition in this sense is not easily recognised whilst carcasses are in the frozen state, but indications that all is not well may be gathered from the state of the covers when the cargo is being discharged A kind of muslin cover is placed over frozen carcasses after they are frozen in which condition the carcasses are dry It follows therefore, that if no thawing afterwards takes place there will be a minimum of staining by blood juices of these covers, and they will be a carcass, an exception being made in the case of meat made up into sausages or some other recognised food product, (*b*) tripe, tongue, and kidneys contained in certain specified preservatives, (*c*) severed parts of a pig not bacon or ham, if not accompanied by an official certificate (this certificate has already been referred to), *(d) severed parts of* a pig in the form of bacon or ham if the lymphatic glands have been removed and if not accompanied by an official certificate, and (*e*) meat, whether from cattle or pigs, if it includes *the ribs from which the pleura has been removed* Class 2 includes only the entire carcass of a pig imported without the head in the natural state of attachment, or from which the lymphatic glands have been removed Class 3 includes meat in the form of severed parts of the carcass of a pig or other edible parts which does not comprise meat of Classes 1 or 2, and which is accompanied by an official certificate "Unclassed meat" is any other foreign meat not included in Classes 1, 2, or 3 Of the above groups, the meat included in Classes 1 and 2 is not allowed to be discharged for sale in this country, meat of Class 3 is approved, subject to being satisfactory on general grounds, whilst "unclassed meat" is submitted to the ordinary routine of inspection

---

[5] The Cold Storage of Beef and Poultry By W D Richardson chairman Chicago Section American Chemical Society First International Congress of Refrigeration

Definite reference in these regulations is therefore made to scrap meat and unrecognisable cuts, certain edible offal, pig carcasses, and forequarter meat stripped of the pleural lining The latter requires no further reference beyond stating that stripping of the pleura often means the removal of evidence of tuberculosis The references to the pig merely ensure that the carcass shall have been examined prior to exportation and certified to be fit for human consumption in cases where the whole carcass is not available for examination in this country and the prohibition of removal of head or glands prevents evidence of disease being removed before exportation In the case of scrap and boneless meat a few additional observations are necessary

BONELESS AND CANNED MEAT

The least satisfactory part of the inspection of imported meat—i e satisfactory to the home inspector—is that relating to boneless meat and canned meat. Scrap meat and trimmings, which are now rightly excluded from importation, were formerly received in barrels or bags, and included neck meat and rib meat cut into small pieces Boneless meat does not necessarily come within the category of scrap meat, for so long as it can be referred to a definite part of the carcass it is grouped as "unclassed meat" Ready and certain recognition of a joint has an important bearing on inspection, for unless an inspector can with certainty refer a piece of meat to a definite part of the carcass he is handicapped in his decision as to the matters to which his attention should be directed He must have a mental image of the characteristics of normal meat from that area, remember the glands to be searched for, and know whether it is a piece which carries a serous membrane This boned meat should therefore, be cut in sufficiently large pieces to show definite anatomical relationship, there must be as little mutilation as possible in removing the bones, serous membranes must not be removed, and the glands of the part left *in situ* and, if possible, so positioned that they may be readily found Attention must be paid also to the packing They must be packed so as to retain as far as possible their normal shape without folding or rolling and each piece should be frozen separately

Granted that all these requirements are complied with, the position still remains unsatisfactory, and the fullest confidence requires to be placed in unknown inspectors Meat so forwarded is generally from poor quality animals, no offal is available to assist the inspector, the general appearance presented by the carcass as a whole is lacking, and much has to be taken on trust. The majority of pieces are examined in the frozen state, as only a few may be thawed owing to the deterioration which follows the process even if re frozen A somewhat similar position confronts the inspector when examining tins of canned meat Little more can be done than ascertain that the contents are sterile Diseased conditions have occasionally been found by careful search of canned meat, but inspection for this purpose is not practicable It is also more probable that a "plainer" class of meat and perhaps scraps, the importation of which is prohibited in the fresh state, may be used for canning

For these reasons, and also to assist in other branches of the inspection of foreign meat, such as the oversight of the sanitary condition under which the different processes are conducted and to ensure that the regulations are observed *I consider that the Government* should appoint exper inspectors to make periodical visits to the foreign abattoi and food preparation places from which food products ar exported to this country It is stated in the last report o *the Chief* Inspector of Foods to the Local Government Boar that two inspectors of the Board have been lent to the Arm to supervise the foreign canned meat supplied to the forces A similar safeguard should be continued after the war in th interests of the civilian population

GENERAL OBSERVATIONS RELATING TO IMPORTED CARCASS MEAT

Carcasses arrive in this country either in the frozen o chilled state Frozen meat has been submitted to a continuous temperature of about 15° F, and is therefore froze solid. Chilled meat has been exposed to a temperature onl 1° or 2° below freezing point, and is therefore ready for sal immediately it is removed from the chilled room It is no necessary to justify the statement that both chilled an frozen meat constitutes a satisfactory article of die which is but little, if any, inferior to the home-kille variety either in the relative amount of nourishment i contains or in digestibility It is possibly somewha more digestible than the recently slaughtered home variety, since it has been satisfactorily proved that the maturation or ripening process slowly operates whilst the carcass is in the chilled condition and perhaps even whilst in the frozen [4] The chief differences between home-killed and imported meat are due to physical changes the result of the process to which the meat is subjected. Apart from the details of dressing the carcass, chilled meat may differ very little from that of home killed It is more readily distinguished from frozen meat, but this distinction becomes progressively less if the temperature to which it has been exposed has been lower than 29° F The fat of chilled meat often assumes a pinkish hue owing to staining with the meat juices, which compares with the yellowish white colour of the fat of home-killed carcasses There is also some roughening of the tissues due to the friction of transportation The bundles of meat fibre assume a dull slate colour and on section the meat shows some excess of moisture which is most apparent on pressure These are really refinements of distinction, and it requires a very *skilled person to state with certainty* in some cases that a small joint is from a chilled carcass and not from a home-killed animal

Frozen meat is more readily recognised The carcass presents an unfinished appearance, the fat is dead white in colour, rigid, and in varying degree rough and ragged Unless previously thawed the outside of the carcass will be found covered with moisture condensed from the atmosphere *On section the muscular* tissue will be found uniformly light in colour, which gives it a washed-out appearance It is moister than either home-killed or chilled meat, and the extent of this exudation will depend upon the care displayed in thawing The exposed surfaces of the sawn bones are white in frozen meat, whereas in chilled, if from young good quality animals, they may retain the rose-tinted appearance of home killed animals

The chief objections to these refrigerated carcasses ar that the moist condition of the flesh and the previou process of maturation which they have undergone rende them liable to putrefactive changes sooner than home-kille *carcasses, and in the case* of frozen meat that the thawing process unless satisfactorily performed results in the *loss o* much of the valuable meat juices

The first of these objections is countered by ordinar *methods of administration* The wholesale butcher keeps his supply in cold stores until he requires it for transmission to the retailer, and the retailer simply buys what he knows he can sell in the period during which the meat keeps in satisfactory condition or he may have a refrigerating chamber in which he keeps his stock, only bringing *out* his supply for sale as he requires it.

The loss of meat juices from frozen meat is of greater importance, but a knowledge of the circumstances which cause it will undoubtedly lessen the risk. *It has* been stated that in the process of freezing, the muscular fibres are lacerated by the ice spicules which form, and that o thawing, the moisture which exudes is due to the escape of the liquid contents of the muscle fibres This, however, does not appear to be the case Richardson[5] has satisfactorily shown that the water freezes outside the cell and not inside. The ice thus formed occupies as much or more space than did the muscle fibres, and these as a consequence of the freezing process become isolated and distorted If meat in this condition be quickly thawed, the fibres are not able to re absorb the liquid as quickly as it reassumes the fluid state, and therefore it exudes from any cut surface On the other hand, if the thawing is done slowly a considerable amount of the juice is reabsorbed and the extent of the moisture observed on the cut surface of a thawed joint depends upon the completeness or otherwise of this reabsorption The rapidity of reabsorption depends to some extent on the temperature at which the meat has been carried. At very low temperatures considerable distortion of the fibres results and they do not so easily regain their shape as those which have been frozen at higher temperatures The practical application of this fact is that meat carried at very low temperatures should be thawed much more slowly than that carried at higher temperatures

---

[4] M Muller: *Zeitschrift für* Fleisch und Milch Hygiene, 1903-4 p 217

This question of permanent damage to the muscular fibres is obviously of some importance, since loss of fluid means loss of valuable proteids, extractives, and salts Fortunately there does not appear to be permanent damage, and, as suggested by Richardson, the process seems analogous to that which takes place when plants are frozen, in which case water freezes outside the cell in a state of considerable purity and not within Such freezing does not necessarily kill the plant, especially if the subsequent thawing is slow Experiments on animals would also indicate that the freezing of animal tissue does not necessarily result in serious damage to the cellular elements, or death would ensue in those cases where fish frozen in ice and submitted to a temperature of – 15° C , and frogs frozen in ice, have regained their vitality on slowly thawing

It follows, therefore, that the defrosting process should be conducted with due regard to the above requirements, and although many attempts have been made to devise mechanical means which would prove satisfactory, such as forcing air by means of a fan through the thawing rooms at progressively increasing temperatures, or the removal of frost and moisture by heated pipes, traders generally do not favour special means since they take a few days to carry out and add to the cost of the meat. In the Nelson system the cold pipes of the ammonia expansion process provide a surface on which moisture is deposited, and steam pipes are used to generate the necessary warmth to thaw the carcasses The steam pipes are placed under gratings in the floor and the cold pipes behind screens on the side walls The space behind the screen is open above and below Hot air rises between the carcasses, and a current is established which results in the warm moist air passing over the cold pipes The moisture is deposited on the pipes in the form of snow, and the cold air falls to be re-warmed by the hot pipes and again rises between the carcasses Meat thawed by this process is certainly dry and of good colour

THE REGULATION OF COLD STORES

In view of the fact that imported meat arrives in this country in shiploads and that the supply is therefore often larger than that required for immediate sale, it is necessary for traders to provide themselves with cold stores in which the meat may be kept in condition until it is required for sale The increase in the number of cold stores is a feature of the present-day wholesale meat trade Many large retailers have also equipped themselves with this desirable accessory In many instances the management of these stores leaves nothing to be desired, in others, however, considerable improvement could be effected

Sanitary supervision is becoming increasingly a matter of importance Dirt or unsuitable substances deposited in cold stores results in objectionable consequences just as surely as do similar conditions in premises devoted to the storage of fresh meat The necessity for supervision is greater in public than in private stores Public stores may be used on the basis of separate parcels being deposited and a change made varying with the bulk and nature of the goods brought in or stores may be subdivided and larger or smaller compartments given over for private use by special arrangement When many persons use a store there cannot be the same care displayed as when the stores are under single administration The common use of stores does not tend to improve either cleanliness or the maintenance of regular temperatures

Cold stores should be well lighted by electric means, not only for supervision, but to enable work to be done under the best conditions Some differentiation of goods deposited is also necessary Mixed goods such as poultry, eggs, fish, cheese, and the like should not be placed in compartments containing meat, and in meat stores the drier carcasses should be separate from the moister offal Provision should be made for adequate drainage or for frequent removal of offal drainage

Goods which are deposited in the stores should be in such a state that they are fit for refrigeration Putrefaction is considerably masked by freezing, and no goods except absolutely fresh material free from any mustiness should be admitted In addition, the removal of frozen goods for sale and the consequent thawing should be sufficient to justify objection being taken to the readmission of such goods with only rare exceptions This matter of admission of products into stores, and the fact that freezing masks decomposition, demand that definite responsibility shall devolve upon someone to ensure that stores are used in a proper manner, and to safeguard the public against cold stores being used to help in getting rid of products which are in an unsatisfactory condition How far responsibility attaches at present to other than the owner of unsound goods so deposited is not clear, but in public stores in which odd products are deposited it seems reasonable to require that the proprietors should be equally responsible with the owner of the goods as regards their condition, and where separate compartments are reserved the sub tenant should be responsible for his own goods and likewise be joined in any responsibility which may devolve upon an owner to whom he grants facilities to store goods in his compartment

It would much help local authorities if definite regulations were framed dealing with these and other matters and perhaps annual registration of ownership of cold stores, with submitted lists of sub-tenants in places where compartments are hired, would prove of service Registers should be kept of the date of all goods admitted and discharged, and such should be available for inspection by the sanitary authority In certain of the United States a time-limit is placed by law on the period during which goods may remain in cold stores In certain instances provision is made for extension of the time, in others the period is absolute In some States, also, all goods are required to be stamped with the date of admission In the present position of our knowledge, it is impossible to fix a period beyond which retention in store should justify destruction and which would operate equitably all round As regards stamping the goods, there is perhaps something more to be said in favour, but it cannot serve any very practical purpose, probably the fact that it would indicate that goods were deposited in season is the best reason A register of admissions and discharges would meet most of the sanitary requirements and present no administrative difficulty Free admission to the stores and to the different compartments and passages should at all times be granted to authorised sanitary officers

THE INSPECTION OF IMPORTED CARCASS MEAT

As in the case of imported edible offal and boneless meat inspection as to "condition" is a more essential requirement in the case of carcass meat than is the subject of disease By condition is meant not the qualities which the breeder considers when deciding whether an animal is fit for slaughter but the condition of the meat on arrival in this country It is obvious that if the temperature to which the meat is exposed has been allowed to rise above a point at which decomposition changes may take place, the meat may be rendered either wholly or in part unfit for human consumption Condition in this sense is not easily recognised whilst carcasses are in the frozen state, but indications that all is not well may be gathered from the state of the covers when the cargo is being discharged A kind of muslin cover is placed over frozen carcasses after they are frozen in which condition the carcasses are dry It follows therefore that if no thawing afterwards takes place there will be a minimum of staining by blood juices of these covers, and they will be a carcass, an exception being made in the case of meat made up into sausages or some other recognised food product, (*b*) tripe, tongue, and kidneys contained in certain specified preservatives, (*c*) severed parts of a pig not bacon or ham, if not accompanied by an official certificate (this certificate has already been referred to), (*d*) severed parts of a pig in the form of bacon or ham if the lymphatic glands have been removed and if not accompanied by an official certificate, and (*e*) meat, whether from cattle or pigs, if it includes the ribs from which the pleura has been removed Class 2 includes only the entire carcass of a pig imported without the head in the natural state of attachment, or from which the lymphatic glands have been removed Class 3 includes meat in the form of severed parts of the carcass of a pig or other edible parts which does not comprise meat of Classes 1 or 2 and which is accompanied by an official certificate "Unclassed meat" is any other foreign meat not included in Classes 1, 2, or 3 Of the above groups, the meat included in Classes 1 and 2 is not allowed to be discharged for sale in this country, meat of Class 3 is approved, subject to being satisfactory on general grounds, whilst "unclassed meat" is submitted to the ordinary routine of inspection

---

[5] The Cold Storage of Beef and Poultry By W D Richardson chairman Chicago Section American Chemical Society First International Congress of Refrigeration

Definite reference in these regulations is therefore made to scrap meat and unrecognisable cuts, certain edible offal, pig carcasses, and forequarter meat stripped of the pleural lining The latter requires no further reference beyond stating that stripping of the pleura often means the removal of evidence of tuberculosis The references to the pig merely ensure that the carcass shall have been examined prior to exportation and certified to be fit for human consumption in cases where the whole carcass is not available for examination in this country and the prohibition of removal of head or glands prevents evidence of disease being removed before exportation In the case of scrap and boneless meat a few additional observations are necessary

Boneless and Canned Meat

The least satisfactory part of the inspection of imported meat—i e satisfactory to the home inspector—is that relating to boneless meat and canned meat. Scrap meat and trimmings, which are now rightly excluded from importation, were formerly received in barrels or bags, and included neck meat and rib meat cut into small pieces Boneless meat does not necessarily come within the category of scrap meat, for so long as it can be referred to a definite part of the carcass it is grouped as "unclassed meat" Ready and certain recognition of a joint has an important bearing on inspection, for unless an inspector can with certainty refer a piece of meat to a definite part of the carcass he is handicapped in his decision as to the matters to which his attention should be directed He must have a mental image of the characteristics of normal meat from that area, remember the glands to be searched for, and know whether it is a piece which carries a serous membrane This boned meat should therefore, be cut in sufficiently large pieces to show definite anatomical relationship, there must be as little mutilation as possible in removing the bones, serous membranes must not be removed, and the glands of the part left *in situ* and, if possible, so positioned that they may be readily found Attention must be paid also to the packing They must be packed so as to retain as far as possible their normal shape without folding or rolling and each piece should be frozen separately

Granted that all these requirements are complied with, the position still remains unsatisfactory, and the fullest confidence requires to be placed in unknown inspectors Meat so forwarded is generally from poor quality animals, no offal is available to assist the inspector, the general appearance presented by the carcass as a whole is lacking, and much has to be taken on trust The majority of pieces are examined in the frozen state, as only a few may be thawed owing to the deterioration which follows the process even if re frozen A somewhat similar position confronts the inspector when examining tins of canned meat Little more can be done than ascertain that the contents are sterile. Diseased conditions have occasionally been found by careful search of canned meat, but inspection for this purpose is not practicable. It is also more probable that a "plainer" class of meat and perhaps scraps, the importation of which is prohibited in the fresh state, may be used for canning

For these reasons, and also to assist in other branches of the inspection of foreign meat, such as the oversight of the sanitary condition under which the different processes are conducted and to ensure that the regulations are observed, I consider that the Government should appoint expert inspectors to make periodical visits to the foreign abattoirs and food preparation places from which food products are exported to this country It is stated in the last report of the Chief Inspector of Foods to the Local Government Board that two inspectors of the Board have been lent to the Army to supervise the foreign canned meat supplied to the forces. A similar safeguard should be continued after the war in the interests of the civilian population

General Observations Relating to Imported Carcass Meat

Carcasses arrive in this country either in the frozen or chilled state Frozen meat has been submitted to a continuous temperature of about 15° F, and is therefore frozen solid. Chilled meat has been exposed to a temperature only 1° or 2° below freezing point, and is therefore ready for sale immediately it is removed from the chilled room It is not necessary to justify the statement that both chilled and frozen meat constitutes a satisfactory article of diet which is but little, if any, inferior to the home-killed variety either in the relative amount of nourishment it contains or in digestibility It is possibly somewhat more digestible than the recently slaughtered home variety, since it has been satisfactorily proved that the maturation or ripening process slowly operates whilst the carcass is in the chilled condition and perhaps even whilst in the frozen [4] The chief differences between home-killed and imported meat are due to physical changes the result of the process to which the meat is subjected Apart from the details of dressing the carcass, chilled meat may differ very little from that of home-killed It is more readily distinguished from frozen meat, but this distinction becomes progressively less if the temperature to which it has been exposed has been lower than 29° F The fat of chilled meat often assumes a pinkish hue owing to staining with the meat juices, which compares with the yellowish white colour of the fat of home-killed carcasses There is also some roughening of the tissues due to the friction of transportation The bundles of meat fibre assume a dull slate colour, and on section the meat shows some excess of moisture which is most apparent on pressure. These are really refinements of distinction and it requires a very skilled person to state with certainty in some cases that a small joint is from a chilled carcass and not from a home-killed animal

Frozen meat is more readily recognised The carcass presents an unfinished appearance, the fat is dead white in colour, rigid, and in varying degree rough and ragged Unless previously thawed the outside of the carcass will be found covered with moisture condensed from the atmosphere On section the muscular tissue will be found uniformly light in colour, which gives it a washed-out appearance It is moister than either home killed or chilled meat and the extent of this exudation will depend upon the care displayed in thawing The exposed surfaces of the sawn bones are white in frozen meat, whereas in chilled, if from young good quality animals, they may retain the rose-tinted appearance of home killed animals

The chief objections to these refrigerated carcasses are that the moist condition of the flesh and the previous process of maturation which they have undergone render them liable to putrefactive changes sooner than home-killed carcasses, and in the case of frozen meat that the thawing process unless satisfactorily performed results in the loss of much of the valuable meat juices

The first of these objections is countered by ordinary methods of administration The wholesale butcher keeps his supply in cold stores until he requires it for transmission to the retailer, and the retailer simply buys what he knows he can sell in the period during which the meat keeps in satisfactory condition or he may have a refrigerating chamber in which he keeps his stock, only bringing out his supply for sale as he requires it

The loss of meat juices from frozen meat is of greater importance, but a knowledge of the circumstances which cause it will undoubtedly lessen the risk. It has been stated that in the process of freezing, the muscular fibres are lacerated by the ice spicules which form, and that on thawing, the moisture which exudes is due to the escape of the liquid contents of the muscle fibres This, however, does not appear to be the case Richardson[5] has satisfactorily shown that the water freezes outside the cell and not inside The ice thus formed occupies as much or more space than did the muscle fibres, and these as a consequence of the freezing process become isolated and distorted If meat in this condition be quickly thawed, the fibres are not able to re-absorb the liquid as quickly as it reassumes the fluid state, and therefore it exudes from any cut surface On the other hand, if the thawing is done slowly a considerable amount of the juice is reabsorbed and the extent of the moisture observed on the cut surface of a thawed joint depends upon the completeness or otherwise of this reabsorption The rapidity of reabsorption depends to some extent on the temperature at which the meat has been carried At very low temperatures considerable distortion of the fibres results and they do not so easily regain their shape as those which have been frozen at higher temperatures The practical application of this fact is that meat carried at very low temperatures should be thawed much more slowly than that carried at higher temperatures

---

[4] M Muller *Zeitschrift für Fleisch und Milch Hygiene*, 1903-4 p 217

This question of permanent damage to the muscular fibres is obviously of some importance, since loss of fluid means loss of valuable proteids, extractives, and salts Fortunately there does not appear to be permanent damage, and, as suggested by Richardson, the process seems analogous to that which takes place when plants are frozen, in which case water freezes outside the cell in a state of considerable purity and not within Such freezing does not necessarily kill the plant, especially if the subsequent thawing is slow Experiments on animals would also indicate that the freezing of animal tissue does not necessarily result in serious damage to the cellular elements, or death would ensue in those cases where fish frozen in ice and submitted to a temperature of −15° C, and frogs frozen in ice, have regained their vitality on slowly thawing

It follows, therefore, that the defrosting process should be conducted with due regard to the above requirements, and although many attempts have been made to devise mechanical means which would prove satisfactory, such as forcing air by means of a fan through the thawing rooms at progressively increasing temperatures, or the removal of frost and moisture by heated pipes, traders generally do not favour special means, since they take a few days to carry out and add to the cost of the meat. In the Nelson system the cold pipes of the ammonia expansion process provide a surface on which moisture is deposited, and steam pipes are used to generate the necessary warmth to thaw the carcasses The steam pipes are placed under gratings in the floor and the cold pipes behind screens on the side walls The space behind the screen is open above and below Hot air rises between the carcasses, and a current is established which results in the warm moist air passing over the cold pipes The moisture is deposited on the pipes in the form of snow and the cold air falls to be re-warmed by the hot pipes and again rises between the carcasses Meat thawed by this process is certainly dry and of good colour

THE REGULATION OF COLD STORES

In view of the fact that imported meat arrives in this country in shiploads, and that the supply is therefore often larger than that required for immediate sale, it is necessary for traders to provide themselves with cold stores in which the meat may be kept in condition until it is required for sale The increase in the number of cold stores is a feature of the present-day wholesale meat trade Many large retailers have also equipped themselves with this desirable accessory In many instances the management of these stores leaves nothing to be desired, in others, however considerable improvement could be effected

Sanitary supervision is becoming increasingly a matter of importance Dirt or unsuitable substances deposited in cold stores results in objectionable consequences just as surely as do similar conditions in premises devoted to the storage of fresh meat The necessity for supervision is greater in public than in private stores Public stores may be used on the basis of separate parcels being deposited and a change made varying with the bulk and nature of the goods brought in or stores may be subdivided and larger or smaller compartments given over for private use by special arrangement When many persons use a store there cannot be the same care displayed as when the stores are under single administration The common use of stores does not tend to improve either cleanliness or the maintenance of regular temperatures

Cold stores should be well lighted by electric means, not only for supervision, but to enable work to be done under the best conditions Some differentiation of goods deposited is also necessary Mixed goods such as poultry, eggs, fish, cheese, and the like should not be placed in compartments containing meat, and in meat stores the drier carcasses should be separate from the moister offal Provision should be made for adequate drainage or for frequent removal of offal drainage

Goods which are deposited in the stores should be in such a state that they are fit for refrigeration Putrefaction is considerably masked by freezing, and no goods except absolutely fresh material free from any mustiness should be admitted In addition, the removal of frozen goods for sale and the consequent thawing should be sufficient to justify objection being taken to the readmission of such goods with only rare exceptions This matter of admission of products into stores, and the fact that freezing masks decomposition, demand that definite responsibility shall devolve upon someone to ensure that stores are used in a proper manner, and to safeguard the public against cold stores being used to help in getting rid of products which are in an unsatisfactory condition How far responsibility attaches at present to other than the owner of unsound goods so deposited is not clear, but in public stores in which odd products are deposited it seems reasonable to require that the proprietors should be equally responsible with the owner of the goods as regards their condition, and where separate compartments are reserved the sub tenant should be responsible for his own goods, and likewise be joined in any responsibility which may devolve upon an owner to whom he grants facilities to store goods in his compartment.

It would much help local authorities if definite regulations were framed dealing with these and other matters and perhaps annual registration of ownership of cold stores, with submitted lists of sub-tenants in places where compartments are hired, would prove of service Registers should be kept of the date of all goods admitted and discharged, and such should be available for inspection by the sanitary authority In certain of the United States a time limit is placed by law on the period during which goods may remain in cold stores In certain instances provision is made for extension of the time, in others the period is absolute In some States, also, all goods are required to be stamped with the date of admission In the present position of our knowledge, it is impossible to fix a period beyond which retention in store should justify destruction and which would operate equitably all round As regards stamping the goods, there is perhaps something more to be said in favour, but it cannot serve any very practical purpose, probably the fact that it would indicate that goods were deposited in season is the best reason A register of admissions and discharges would meet most of the sanitary requirements and present no administrative difficulty Free admission to the stores and to the different compartments and passages should at all times be granted to authorised sanitary officers

THE INSPECTION OF IMPORTED CARCASS MEAT

As in the case of imported edible offal and boneless meat, inspection as to "condition" is a more essential requirement in the case of carcass meat than is the subject of disease By condition is meant not the qualities which the breeder considers when deciding whether an animal is fit for slaughter but the condition of the meat on arrival in this country It is obvious that if the temperature to which the meat is exposed has been allowed to rise above a point at which decomposition changes may take place, the meat may be rendered either wholly or in part unfit for human consumption Condition in this sense is not easily recognised whilst carcasses are in the frozen state, but indications that all is not well may be gathered from the state of the covers when the cargo is being discharged A kind of muslin cover is placed over frozen carcasses after they are frozen in which condition the carcasses are dry It follows therefore, that if no thawing afterwards takes place there will be a minimum of staining by blood juices of these covers, and they will be practically non adherent, which would not be the case if re-freezing has followed thawing At the port of entry it is impracticable to examine every carcass, but in any particular consignment a breakdown will probably affect a considerable proportion of all carcasses, so that an examination of, say, 10 per cent will give a reliable indication as to the condition of the whole The question of disease generally arises when the carcass is being cut up either in the wholesale market or in butchers' shops

---

[5] The Cold Storage of Beef and Poultry By W D Richardson chairman Chicago Section American Chemical Society First International Congress of Refrigeration

Breakdowns in machinery will always occur, but with improvements in refrigeration plant and the special equipment of vessels for meat transportation these are becoming less frequent

In the earlier days of the trade much difficulty was experienced from the formation on carcasses of moulds These deposits were of various kinds, some being the usual superficial growths of mucor or penicillium, whilst others formed in the superficial tissue in the form of spots of various colours belonging to the saccharomyces and oidium and other groups To some extent there is a relation between temperature and their formation, since moulds are known to grow at temperatures round about freezing point, moulds and defective condition are, therefore, not infrequently associated Moulds however, will not develop without original contamination, and this problem has been almost solved by rigid attention to elementary cleanliness in the slaughtering places, the chill rooms, the holds of ships, the transporting vans, and the cloths which enclose the carcasses and the cleanliness of those who handle the meat, and in the case of offal, improvements in the method of packing

To effect surface disinfection of meat the Linley process was invented This consists of a method whereby air charged with formalin vapour is passed into the freezing or chilling room After remaining for a time the formalin is replaced by cold air which has been dried by passing over calcium chloride and purified by being forced over zinc plates moistened with sulphuric acid In the early days of this process exception was taken to the use of formaldehyde vapour owing to the fact that it could be shown that formaldehyde penetrates into meat so treated to varying depths In the first 5 mm of muscular tissue unprotected by fat it was found to the amount of 1 in 3500 and in the second 5 mm to 1 in 10,000 Dr G S Buchanan,[6] reporting on the subject, suggested that importers and traders concerned should consider whether the disinfection by formaldehyde should not be limited to the disinfection of the hold before the introduction of the meat

The process is now used somewhat differently from what was then the practice The chilling room at the place of slaughter is filled with the carcasses of that day's killing, generally to the number of 125 to 155 The temperature of the chamber before commencing to fill is brought down to 42° F It rises during filling to from 50° to 65° This is reduced to the chilling temperature, i e, somewhat below 32° F, in from 28 to 36 hours Formalin vapour is introduced into the chill room at the higher temperature, and the meat is left exposed to it for from 40 minutes to one hour No refrigeration takes place in this interval The cold air circulation is then set in operation and dried and cleaned air is then passed through the chamber The meat is held up in the chill room until the time comes for exportation, and dried and cleaned air is afterwards passed through the chamber for 30 minutes every 24 hours Originally the holds on the steamers were formalised, but that is not now the case The chill rooms on the steamer are filled with carcasses, and afterwards only the dry clean air is passed through for periods of 30 minutes every day Formerly one ounce of 40 per cent formaldehyde to every 100 cubic feet of atmosphere was vaporised, but now the amount is 1 to 300

BONE TAINT

A subject which may properly be referred to under "condition" is the objectionable defect known as bone taint Although not so frequently met with as formerly, it is still a cause of condemnation of imported carcasses. On occasions quite a considerable number of quarters so affected are discovered but fairly lengthy periods may elapse during which only odd instances are noted

This defect is characterised by deep-seated putrefactive changes in the thick muscles in the neighbourhood of the hip and shoulder joints, chiefly the former There are no external appearances which would suggest the presence of putrefaction, and it is most frequently observed in the primest animals, and particularly in those slaughtered during the summer months The condition is found on sectioning the carcass or by exploring with a skewer in chilled and an augur and bit in frozen carcasses

The cause has been variously assigned to putrefaction of the joint-oil, the conveyance of organisms by the blood during life, the retention of animal heat, &c My own observations lead me to the conclusion that the condition is often due to the insuction of putrefactive micro-organisms into the large blood vessels at the time of dressing the carcass That excessive fatigue may be a cause of bone taint has long been recognised It appears undoubted that the usually sterile blood may contain organisms in certain circumstances This happens after excessive fatigue In such cases organisms capable of giving rise to offensive putrefaction may exist in the blood vessels at the time of slaughter, and taint might therefore arise in those situations where the animal heat is maintained for a sufficiently long period Those cases of bone taint, however, to which reference is here made, appear more likely to result from external contamination as suggested The inherent animal heat is sufficient to maintain the vitality of such organisms for several days, and the desirable temperature is continued for a longer period in animals which are in the primest condition and show the thickest layer of fat. Summer heat helps, inasmuch as there are probably more of these organisms air borne in summer than in other months and perhaps because in the preliminary few hours wait of the carcasses for chilling the heat does not leave the carcass so rapidly as in colder months

Examination of the large arteries in the affected part shows that the internal lining membrane is foul and discoloured for a length of three inches or more in the deepest parts of the joint, and I have seen as many as three centres on the same side The veins do not show the change, or if so only in lesser degree Once putrefactive organisms are deposited within the artery they continue to develop until checked by the cold, and the offensiveness thus generated appears to be retained and only released on cutting into the part Dr Andrewes, bacteriologist for the City of London, who has examined these dissected specimens bacteriologically, reports the presence of several organisms In one case he found *Proteus zenkeri* and forms of *Bacillus coli* (not *communis*) and *B lactis aerogenes* There were no anaerobic organisms detected The lining membrane of the artery contained an abundance of these organisms The surrounding tissue contained similar organisms except that the proteus was absent and the numbers of those found were much more sparse than in the arteries In other cases flesh from the offensive area was found practically free from organisms and the hip-joint contents were sterile

It is not difficult to see how organisms may reach the deeper blood vessels By the act of bleeding the arteries are emptied of blood and reflex contractions of the muscles submit them to compression On relaxation of the pressure the elastic arteries dilate and air containing organisms will be sucked in When the main arteries are divided in the pelvis at the time of dressing only a few inches separate the cut end from the localities where the putrefaction arises As it takes several days for carcases to freeze completely or even to chill thoroughly in the deeper parts there is ample time for development to take place in the deep parts of these carcasses, particularly in those containing the thickest amount of tissue

The condition as stated is not now so frequently observed as formerly, but if it is desired to eliminate the defect completely ligature of the artery before division, which division should be on the aorta side of the ligature would probably prove effective and would not be difficult to arrange

ORANGE COLOURED STREAKS IN THE FAT OF IMPORTED CARCASSES

A physiological condition which, therefore, cannot be described under either "condition" or "disease" is met with in certain imported carcasses It is characterised by the presence of well defined orange-coloured streaks in the fat surrounding the kidneys and in the fat of other parts where it is deposited in considerable amount A similar condition I have occasionally observed in home killed animals, but whether it affects home killed or imported animals it is only found in the fattest and best-conditioned The defect has not been regarded as one which will cause harm to human beings, but it is of such a pronounced character in some cases that it renders the fat unmarketable

---

[6] Reports to the Local Government Board, by Dr G S Buchanan and Dr S B Schryver D Sc on the Application of Formaldehyde to Meat (Food Reports No 9)

Dr Andrewes investigated the condition in the fat removed from a home-killed animal It is probable that the following facts which he established would apply equally to the defect observed in imported carcasses The change appears to occur along the small blood vessels which accounts for the veined appearance of the orange coloured marking The fat in the affected area is largely split up with formation of abundant needle shaped crystals of fatty acids These do not stain with iodine, and are hence a saturated fatty acid probably stearic acid Such a change must be brought about by a fat-splitting ferment, which from the distribution of the change is probably conveyed by the blood It has been proved by Abderhalden that when animals receive a diet containing fat in excess, such a fat-splitting ferment becomes actually demonstrable in the blood. It is therefore possible that in fattened animals a sufficient amount of the ferment is present in the blood at death to give rise to local fat splitting around the blood vessels Mr Mackenzie Wallis, on Dr Andrewes's staff, examined the pigment of the yellow areas, which he found could be readily extracted with petroleum ether, to some extent with ether, but not by alcohol The solution gave the spectrum of a lipochrome. There were no bands suggesting derivation from hæmoglobin, nor was there any evidence of hæmatoidin or any blood derivative It could not be determined whether the pigmentation was due to a concentration of the natural lipochrome of the fat or to lipochrome brought by the blood stream

The conclusion to be drawn from the above is that animals may be "over conditioned" with consequent loss to the salesman owing to the unmarketable characteristics which are acquired by considerable quantities of valuable fat

THE DISEASES OF IMPORTED CARCASSES

The diseases to which foreign cattle are subject differ in many respects from those observed in this country, and although it would not be possible here to enter fully into any detailed description, it may be of service to direct attention to the main features In general it may be stated that diseased carcasses are eliminated from those exported, and to this extent a word of appreciation of this branch of inspection as conducted in exporting countries is not out of place.

The chief exporting countries and the class of product exported have already been described and the chief affections met with are —

Australia Onchocerciasis in cattle

Argentina Actinomycosis in ox tongues and a number of instances of tuberculosis

Holland Tuberculosis and hæmorrhagic lesions in pigs

Russia Foot and mouth disease was noted in a number of dried tongues imported in 1913

Sweden This country before the war exported many calves, but no exceptional incidence of disease was noted

Cases of caseous lymphadenitis are occasionally met with in sheep from different countries

Organs occasionally show evidence of the usual parasitic diseases and other conditions which may have escaped detection during inspection

Onchocerciasis which results from invasion of cattle by the parasitic worm *Onchocerca gibsoni*, has been dealt with administratively on the following lines The brisket, in which joint are chiefly located what are termed the worm nests characteristic of this disease, is cut off all Australian carcasses exported to this country, and the region of the stifle joint is explored by suitable incisions for the presence of the nodules These mutilations of sides of frozen meat are sufficient to distinguish Australian meat from all other and are carried out by arrangement between this country and Australia The only difficulty which now arises is that the briskets are occasionally cut too short with the result that the worm nests may be found on the forequarter in the neighbourhood of the incision This is an infrequent occurrence and is generally the result of some easily remedied inspectorial difficulty

The loss to Australian cattle breeders must be considerable from this cause, and research work is in progress with the object of devising suitable preventive measures The present position of knowledge[7] appears to be that by means of a biting insect, either *Stomoxys calcitrans* or *Culicoides vigilax*, embryos are taken up from the bovine host In the insect a certain stage of development takes place, and eventually the partly developed worm or worms are injected into the subcutaneous tissue of the new bovine host Having been injected, the worms increase in size and start on their migrations From the lower part of the leg they reach the front of the knees, and from the fore limb they reach the brisket area Living embryos are deposited and by means of toxic products cause a certain amount of swelling which leads eventually to some degree of fibrosis When the adult worm is arrested embryos continue to be released, and the reaction results in the encapsulation of the worm in the fibrous mass which is noted in meat-inspection work The embryos in the early stage, or even after encapsulation, may escape and reach situations where they may be taken up by a biting fly

As regards Argentine animals, the following particulars (Table XV) given to Mr Young, veterinary surgeon of the City Corporation, indicate the prevalent diseases and their frequency (The figures relate to the year 1912)

TABLE XV

—	Cattle	Pigs	Sheep
Total number slaughtered	1,368,000	8922	3,217,367
Tuberculosis ..	4%	19 3%	—
Echinococcus veterinorum	25%	—	28 3%
Distomatosis	—	—	2 4%
Actino-bacillus	6407	—	—
Jaundice ..	1467	—	1713
Trichinosis ..	—	2 5%	—
Cysticercus cellulosæ	—	0·3%	—
Caseous lymphadenitis	—	—	3·6%

Actinomycosis —The presence of actinomycosis in Argentine ox tongues has been reported on both by the officers of the corporations of Liverpool and London In London the condition is still noted, but not so frequently as two years ago, and the diseased tongues which are now observed are generally only slightly affected The condition has been recently investigated by Dr Griffith,[8] of the Local Government Board, who considers in a preliminary report, that the bacillus of Lignières and Spitz is responsible for the Argentine cases He also found that 40 out of 44 English cases were caused by the same bacillus As actinomycosis is a disease to which human beings are liable, this condition requires further investigation, and the prohibition should meanwhile be continued against the importation of tongues so infected.

The condition in ox tongues chiefly affects the retropharyngeal glands more rarely the blades In the early stages the glands may not even be enlarged but section shows the glandular elements to contain several prominent points resembling granulation tissue In more advanced cases the glands are enlarged and filled with yellowish semi purulent material containing sand like gritty bodies The disease may be mistaken for tuberculosis with which the Liverpool researches indicate it is frequently associated A few years ago the percentage of affected tongues imported into London varied in different consignments between 5 and 20 per cent

Hæmorrhagic flesh —The hæmorrhagic condition observed in pigs imported from Holland is apparently not the result of disease and is probably of similar origin to the corresponding condition occasionally observed in pigs, and sometimes in cattle, slaughtered in this country Punctate or even larger hæmorrhages in the muscular tissue of the diaphragmatic and abdominal muscles are seen in animals which are obviously in sound condition These appear to be due to the laceration of the muscular elements and capillaries by the muscular contractions which follow stunning, particularly when several are stunned at a time and some little interval elapses before they are bled. The condition is objectionable if very extensive since the number of hæmorrhagic points renders the flesh unsightly and may encourage premature decomposition If the condition is of limited extent the affected part may be removed and destroyed, but if extensive condemnation of the carcass is called for

[7] Further Investigations into the Etiology of Worm Nests in Cattle due to *Onchocerca gibsoni* By J Burton Cleland M.D , Ch M Sydney Commonwealth of Australia 1914

[8] Preliminary Report on the Pathology of Bovine Actinomycosis by Fred Griffith M B Local Government Board Food Reports No 23

Berger[9] has investigated this subject and reports having observed in the *situations stated* hæmorrhages of a length of from a few millimetres to 2 centimetres with an average width of 2 millimetres Berger had control of two establishments at which pigs were slaughtered and made the following observations —

In abattoir A, previous to May 1st, 1909, the pigs were slaughtered with the mallet in batches of 20 at a time, each pig receiving a blow with the mallet, but it was not till the *whole 20 had been thus stunned that bleeding* was practised Moreover, the animals were not bled in accordance with the order in which they were stunned While this method was followed the hæmorrhages under consideration were very abundant at this abattoir, 2 per cent of the pigs showing them

In abattoir B the pigs for a long time had been killed by the American method—viz , the animal being suspended in the air by the hind limbs and bled immediately without stunning, with the head hanging downwards In about 140,000 pigs killed in this fashion Berger never observed the hæmorrhages

Previous stunning was then introduced into this abattoir, and from the day of its introduction the hæmorrhages commenced to appear

The author thinks, therefore, that the hæmorrhages may be attributed to the stunning He has attempted to find out whether the exact method of stunning adopted exercises any influence, and he has been informed that the hæmorrhages have not been observed in abattoirs where special apparatus (the bullet, percussion, &c) are employed In Germany, where pigs are generally stunned by a blow from the mallet, hæmorrhages are encountered in 25 per cent of those killed

In abattoirs it often happens that, no order being followed, the first pigs to be stunned in a batch are the last to be bled In Abattoir A, therefore, it was arranged that no more than six pigs were to be stunned at a time before bleeding, and when this was done, it was quickly found that muscular hæmorrhages diminished

Berger then directed that the pigs should be bled immediately after stunning, and while previous to this he had found hæmorrhages in 2 per cent of the animals killed, he has since, up to the present time, inspected 5000 pigs without *finding one case Ruptures of the muscular fibres*, however, are still observed, but as the pigs are bled immediately, the blood has little time to become extravasated into these ruptures

It is evident, nevertheless, that *hæmorrhages may be produced* a certain time before slaughter by the different traumatisms in which the pigs may be exposed

Foot and-mouth disease was noted as affecting several consignments of smoked tongues received in London prior to the war They arrived from a district in which the disease was endemic, and it was observed that the lesions varied from the early vesicular stage to healed cicatrices A separate inspection of all tongues was called for and a decision arrived at that in future, consignments showing such lesions would be refused admission, as the duty of controlling *such imported food rested* with the authorities of the country of origin

THE HANDLING OF MEAT

The handling of meat is a subject which affects both the distribution of home killed and imported products It is a matter to which attention has been often directed in the past, but no permanent improvement has so far been effected The transportation of imported meat from the ships to the cold stores and thence to the market compares favourably with that of home killed produce, but the transference of meat of either class from the market to butchers' shops *often leaves much to be desired*

Many persons in country districts who slaughter only small amounts send the meat to market by passenger train, and it often happens that sufficient attention is not paid to the packing The same *observation applies to meat sent to* country shops Defective packing encourages decomposition, and inadequate covering renders the meat liable to contamination in transit

After the purchase of meat at the wholesale market has been completed subsequent care becomes the responsibility of the purchaser Porters are generally engaged to perform the manual labour of conveying the meat from the stall to the carts which convey it to the retailers' premises A porter carries meat on his back, and when large parts are transferred it often rests on his head In addition to the requirement that porters should frequently change their overalls, they ought also to be required to wear a washable head covering

On arrival of meat at the carts it should not be placed at the ground level, even if on low wooden supports, prior to being packed in the cart , neither should trucks conveying meat be allowed to stand in public ways uncovered where the cut section of meat may collect dust and dirt.

Carts designed for any purpose except the satisfactory conveyance of meat are used Even when clean, unsatisfactory construction causes dirt to be left in places from which it cannot easily be removed

Coarse brown sacking is the most frequent covering I have seen used to enclose meat It is difficult to see when it is soiled, and as a consequence it is not scalded after each time of use White washable cloths are the exception

The bottom and sides of the cart are either covered with sacking or else with a layer of straw In some instances the straw is below the sacking, but by no means usually Straw is a most unsatisfactory medium on which to place the cut sections of meat

The meat is packed in the cart without satisfactory regard being paid to the danger of street dirt being conveyed to the meat If a white cover were laid on the bottom of the cart it could be rolled up as far as necessary whilst a part of the van is being packed and unrolled gradually as filling proceeds, thus covering the feet-marks of the man who must be in the cart. Other products are often packed with the meat. Boxes of rabbits and boxes containing various materials can often be seen either resting on the meat or supporting it The fur of the rabbits projects through the latticed wooden cover of the box and is often in contact with the meat. It *is impossible to state with what wooden boxes from* abroad have been in contact, and so one might enlarge upon this point

Tarpaulins are used for the outside cover, and these are often far from clean and sometimes come into contact with the produce, which should be avoided.

Drivers are not careful , some may be seen driving through the streets sitting on the meat The vans are not always completely covered Any day in different parts of London meat-vans may be seen with a great superficial area of meat exposed to the dust and dirt both at the front *and back*

It should be noted as emphasising these points that the meat is often not in the form of sides but has been cut across, leaving large moist sections of meat exposed These surfaces should be covered with grease *proof paper* and more use made of cloth coverings both for joints and for sides of beef In the slaughter houses due regard requires to be paid to the observance of cleanliness , in the markets the traders vie with one another in matters of order and cleanliness, and in the shops retailers recognise the value of brightness and prove it by good lighting, clean benches, bright brass and steel fittings, and clean looking tiles , but in the interval between purchase from the wholesale dealer and the reception of the meat at the shop there is this remarkable apathy displayed by some as regards observance of elementary rules

Although no ill results are reported as a direct consequence of present methods—for which perhaps we have to thank the cooking process to which meat is subsequently subjected—they offend sentiment and should be improved upon It is difficult to suggest any official action which can be taken at the present time, since no specific regulation is ignored and the negligence arises in what may be regarded as "no man's land " Inside the markets control is possible and is exercised, and meat is handled on many stalls in a manner which is worthy of commendation The difficulty chiefly arises outside The chief hope of immediate improvement rests with the butchers *Those who recognise* their responsibilities in this connexion should bring pressure to bear through their trade organisation on their less careful associates, and as a future *direct* effect it may be possible, if regulations are subsequently framed to control meat inspection, for the requirement that food shall be handled in a cleanly manner to be incorporated in the series

CONCLUSIONS

In conclusion, I need not say more than repeat the requirements which appear to me to be necessary to put meat inspection on a more satisfactory basis

---

[9] Veterinary Record, Sept 30th 1911 Muscular Hæmorrhage in the Muscles of the Pig

1 With a view to ensuring uniformity of action *routine* meat inspection should be made a compulsory duty of all urban sanitary authorities

2 With a view to safeguarding more adequately the supply in urban districts there should be compulsory inspection of those slaughter houses in rural districts at which carcasses are dressed for sale in outside areas

3 Inspectors engaged on meat-inspection work should be required to possess proof of knowledge of the subject

4 Regulations should be framed dealing not only with the details of inspection of carcasses but with the sanitary requirements of slaughter houses, facilities for inspection, and perhaps the requirements of ante-mortem examinations

5 A system of meat marking under the direct control of the Local Government Board should be instituted, and as a commencement its adoption should be voluntary, but permission to adopt should be within the power of the Board to grant or to refuse

6 In districts where a system of meat-marking is in operation the local authority should have power to require that all meat used in prepared food products should be inspected and approved before being used.

7 In view of the impossibility of satisfactorily examining in this country imported boned meat and meat in the canned form, some of the responsibility which now devolves upon home inspectors should be accepted by the Government who should appoint inspectors to visit the chief places abroad where the work of boning, canning, and exporting meat generally is carried out In this way attention could be given to the observance of hygienic requirements and to the quality and character of the meat used.

8 Regulations should be framed to control cold stores in which food products of any kind are stored

9 Regulations should be framed to ensure that meat is handled in a cleanly manner

THE PHYSIOLOGICAL AND ANTISEPTIC ACTION OF FLAVINE

(WITH SOME OBSERVATIONS ON THE TESTING OF ANTISEPTICS)

BY ALEXANDER FLEMING, F R.C S ENG ,

TEMPORARY LIEUTENANT R.A.M C.

(*From a Research Laboratory of a Base Hospital in France*)

FLAVINE, or acriflavine has been much in evidence recently and it has been claimed for it that it approaches the ideal antiseptic in that it has no deleterious effect on the tissues and that the antiseptic power is increased by admixture with serum Browning and his co-workers[1] have published a table giving the antiseptic values and the influence on phagocytosis of a number of antiseptic solutions and they arrange them in order of merit by means of a 'therapeutic coefficient " which they define as the ratio of the antiseptic power in serum to the power of inhibiting phagocytosis The latter is used as an index of the general toxicity to living matter " They claim for flavine that it has a very high antiseptic value for the common organisms found in wounds and that in the strength they apply it (1 in 1000) it is practically without harmful effect on the tissues as measured by its action on leucocytes

This antiseptic has been introduced into practice purely as the result of laboratory experiments and thus it would be well to make sure that these are without flaw before drawing deductions as to its clinical value

I propose to set forth in this article the result of some experiments I have made with flavine, which show that the claims which have been made that this substance approaches the ideal antiseptic are based on fallacious experiments, and that by altering the experimental conditions slightly the "therapeutic coefficient' can be altered to an enormous extent I will show also that the action of flavine on living tissues (as exemplified by leucocytes) is far in excess of its lethal action on bacteria

The flavine used in these experiments was supplied by the Medical Research Committee and has been tested at the Bland-Sutton Institute to ' ensure its being free from toxicity to human tissues and as efficacious in the control of bacterial infections as the sample with which the preliminary experiments and trials were conducted "

PART I —*Action of Flavine on Human Blood*

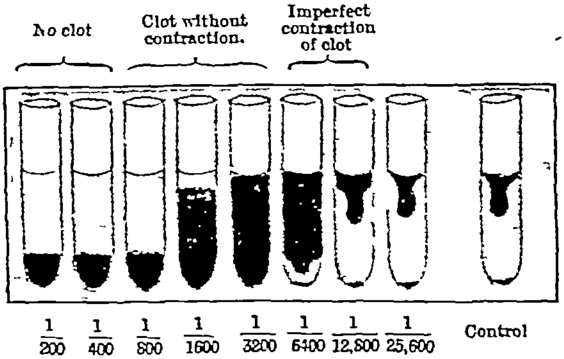
(*a*) *On the red corpuscles* —There is very marked agglutination of human red corpuscles up to a dilution of flavine of 1 in 3200 A dilution of 1 in 6400 showed only slight agglutination and the higher dilutions showed none at all This would only be of importance if flavine were used as an intravenous injection, but I hope to produce evidence later that flavine is useless as a therapeutic agent by the intravenous route, so this point need not be further discussed

(*b*) *On the clotting power of the blood*

Experiment 1 —My own blood mixed with an equal volume of normal salt solution clotted in 2½ minutes at 37° C Under the same conditions my blood mixed with an equal volume of flavine (1 in 1000 in normal salt solution) failed to clot in 60 minutes

Experiment 2 —One volume of each of a series of progressive dilutions of flavine were mixed with an equal volume of my blood in small test tubes and incubated at 37° C for three hours The results are shown in Fig 1 from which it can be seen that 1 in 400 flavine has completely inhibited clotting, 1 in 800 had formed a very light clot after the agglutinated corpuscles had sedimented 1 in 1600 and 1 in 3200 showed loose clots and here the sedimentation had not proceeded so far before clotting had occurred 1 in 6400 was the first dilution in which any contraction of the clot was observed and even in 1 in 12,800 there was shown some deficiency in the contraction of the clot

FIG 1



Effect of flavine on coagulation of blood

It is very difficult to estimate the importance of this inhibitory power on the coagulation of the blood Sir Almroth Wright has for many years combined with his hypertonic salt solution some citrate of soda to prevent clotting of the lymph in a wound and flavine may be beneficial in this way This action of flavine however, must be borne in mind when it is applied to freshly incised wounds which may be oozing and where the inhibitory action on clotting would allow this oozing to continue Probably the flavine would soon be diluted below the point at which it has any action, but even then the result would be an excessive amount of blood clot which might furnish a nidus for bacterial growth

(*c*) *Action of flavine on the leucocytes* —Browning and his co-workers measured the toxic effect of flavine and other antiseptics on the leucocytes by introducing these substances as a fourth volume in an ordinary opsonic mixture and estimating the amount of phagocytosis which had taken place in 20 minutes A more direct method is to observe the effect of the antiseptic directly on the movements of the leucocytes Sir Almroth Wright[2] has given us a simple method of observing the emigration of leucocytes, and this method I have used except that instead of blowing out the clots and staining them I have examined them directly at intervals *in situ*

Experiment 3 —Serial dilutions of flavine are made in normal salt solution, and to each of these dilutions is added an equal volume of blood from the finger They are rapidly mixed drawn into Wright s emigration tubes, sealed at one end, and centrifuged before the blood has clotted After this the tubes are closed and arranged in order on a microscope slide being kept in place by plasticine. They are then incubated at 37° C., with the portion of the tubes containing the red blood corpuscles downwards so that any leucocytic emigration into the white clot has to be against gravity After intervals of one three and six hours the tubes are examined with a 2 3-inch or a 1/6-inch objective and the amount of emigration noted

Using this method I find constantly that a 1 in 2000 dilution of flavine completely inhibits the emigration of the leucocytes, while a 1 in 4000 dilution shows a partial inhibition In dilutions weaker than this the leucocytes have emigrated through a distance corresponding to three or four fields of a 1/6-inch objective as they have done in the control without flavine,[3] but in the tubes containing flavine up to a dilution of 1 in 64,000 (the highest dilution observed) the leucocytes appear as rounded bodies in marked contrast to those in the control tube which present a very irregular appearance and show active amœboid movements In all the flavine dilutions also the leucocytes take up the stain and show a much deeper yellow colour than does the surrounding fluid

---

[1] Browning Kennaway Gulbransen and Thornton: Brit Med Jour Jan. 20th, 1917

[2] Wright: THE LANCET April 17th 1915

This attraction of the leucocytes for the dye and the absence of amœboid movement naturally lead to the question, "Are these leucocytes in the flavine dilutions dead?" To test this I estimated the phagocytic power of leucocytes after exposure to various strengths of flavine

Experiment 4.—Serial dilutions of flavine were made in normal salt solution from 1 in 500 to 1 in 32,000 To 0 5 c c of each of these dilutions was added 0 5 c c. of defibrinated human blood. These were mixed and incubated at 37° C A control tube was also made with equal volumes of defibrinated blood and normal salt solution After five hours incubation the tubes were shaken and with capillary pipettes two volumes of the contents of each tube were mixed with one volume of staphylococcus emulsion, incubated for 15 minutes at 37° C and then proceeded with as in the estimation of the opsonic index The cocci contained in 100 cells were enumerated (where 100 recognisable cells could be found). The results are shown on Table I —

TABLE I—*Phagocytic Power of Leucocytes after Exposure to Flavine for Five Hours*

Flavine concentration	No of cocci in 100 cells	Condition of leucocytes
1 in 1 000	0	*Broken up and hardly recognisable*
1 , 2,000	0	" "
1 4 000	0	Mostly destroyed A few stain well
1 ,, 8,000	0	" "
1 16 000	25	Much disintegrated
1 , 32,000	59	
1 64 000	128	
Control	920	Normal appearance

Experiment 5—The previous experiment was repeated except that the flavine dilutions were made in defibrinated blood from a 1 in 1000 saline solution of flavine To 0 5 c c of each of these dilutions was added 0·5 c.c of defibrinated blood Samples were tested as in the previous experiment, after 5 hours and again after 24 hours The results are shown on Table II —

TABLE II.—*Phagocytic Power of Leucocytes after Exposure to Flavine Dissolved in Blood*

1 *After 5 hours*

Flavine concentration	Cocci in 100 cells	Condition of leucocytes
1 in 2 000	0	Hardly recognisable as cells
1 , 4 000	0	" "
1 8,000	0	One or two with nuclei still visible
1 , 16 000	0	
1 , 32,000	5*	Either broken up or pycnotic
1 64 000	7	" "
1 ,, 128 000	49	
1 , 256 000	53	"
1 600 000	200	Many broken up but *some* stain normally
1 1 000 000	192	"
1 , 2,000 000	320	In good condition
Control	372	"

* In 1 cell

2 *After 24 hours*—The cells in all the dilutions up to 1 in 2,000 000 were much broken up and none of them showed any phagocytosis although in the control tube the leucocytes stained well and nearly all of them contained ingested cocci

An experiment similar to Experiment 5 was done substituting carbolic acid for flavine and it was found that a 1 in 2000 dilution only partially destroyed the functions of the leucocytes in 24 hours

We see from these experiments that flavine, if allowed to act for some hours, has a very powerful leucocidal action and that even a 1 in 2,000,000 dilution will completely destroy all the leucocytes in 24 hours The leucocidal action, also, is more marked in Experiment 5, in which flavine was acting in a greater concentration of serum, than in Experiment 4, in which equal parts of a saline solution and blood were employed This indicates that possibly the leucocidal action of flavine is enhanced by combination with serum in the same way as is bactericidal action The lethal effect of flavine on leucocytes is, as we shall see later, much greater than its bactericidal action

The importance of the time factor in regard to the estimation of the toxicity of flavine on the leucocytes will be further discussed in connexion with the "therapeutic coefficient"

PART II—*Antiseptic Action of Flavine*

Browning and his co-workers have given the following figures for the antibacterial power of flavine —

Medium	Organism	Lethal concentration of flavine.
Peptone water	Staphylococcus	1 in 20,000
Serum		1 200,000
Peptone water	*B coli*	1 , 1,300
Serum		1 100,000
Blood	Staphylococcus	1 , 40,000
Pus	Staphylococcus and streptococcus	1 2,000

The following experiments will bring out clearly, among other things, that the high antiseptic values for flavine in serum can only be obtained in special conditions, and do not give us a clear indication as to the value of this antiseptic as an application to wounds

Does the Number of Microbes Introduced into the Antiseptic Solutions make an Appreciable Difference to the "Lethal Concentration" of the Antiseptic?

Browning and his co workers in their experiments on flavine added 0 1 c c of a 1 in 20,000 dilution of a peptone water culture of the organism to 1 c c of the antiseptic solution A loopful of such a dilution of the culture "yielded 20 or more colonies" We see, then, that in all cases they gave the antiseptic only a very few microbes to kill I made some experiments with a view to ascertaining what difference was made to the apparent lethal concentration of an antiseptic by the addition of varying numbers of microbes

Experiment 6—Progressive dilutions of carbolic acid crystal violet, and flavine were made in broth and to 0 5 c.c. of each of these dilutions was added 0 5 c c of a staphylococcus emulsion in broth A control tube was put up in which the antiseptic was replaced by broth and 10 c mm of this control tube yielded 32 colonies when plated on agar Thus the staphylococcal emulsion used in this case was probably somewhat weaker than that used by Browning Another set of tubes were put up identical with the last, except that the staphylococcal emulsion used was 5 000 000 times as strong The tubes were incubated at 37° C At intervals 10 c mm samples were taken out and transferred to broth tubes The results are shown in Table III :—

TABLE III—*Effect of Variation of the Strength of the Bacterial Emulsion on the "Lethal Concentration" of an Antiseptic* (*in Broth*)

CARBOLIC ACID							CRYSTAL VIOLET							FLAVINE.						
Concentration of antiseptic	Strong emul of staph*			Weak emul of staph.			Concentration of antiseptic	Strong emul of staph			Weak emul of staph.			Concentration of antiseptic.	Strong emul. of staph.			Weak emul. of staph		
	Time of action of antiseptic (in hours)							Time of action of antiseptic (in hours)							Time of action of antiseptic (in hours)					
	2	5	23	2	5	23		2	5	23	2	5	23		2	5	23	2	5	23
1 in— 100	+	0	0	0	0	0	1 in— 10 000	+	+	0	0	0	0	1 in— 1 000	+	+	0	0	0	0
200	+	+	+	+	0	0	20 000	+	+	+	0	0	0	2,000	+	+	0	0	0	0
400	+	+	+	+	+	+	40 000	+	+	+	+	+	0	4 000	+	+	0	0	0	0
800	+	+	+	+	+	+	80 000	+	+	+	+	+	0	8 000	+	+	+	0	0	0
							160 000	+	+	+	+	+	0	16 000	+	+	+	+	+	0
							320 000	+	+	+	+	+	0	32,000	+	+	+	+	+	0
							640 000	+	+	+	+	+	0	64 000	+	+	+	+	+	0
							1 280 000	+	+	+	+	+	+	128,000	+	+	+	+	+	0
							2,560 000	+	+	+	+	+	+	256 000	+	+	+	+	+	0

* Staph = Staphylococci, emul = emulsion

+ = Growth on subculture O = Complete sterilisation

Experiment 7—Two series of experiments were made the only difference being that in the one case the staphylococcal emulsion was 100 000 times stronger than in the other Progressive dilutions of flavine were made in serum and one volume of each of these dilutions was thoroughly mixed with an equal volume of staphylococcus emulsion in serum, incubated in capillary tubes at 37° C for 24 hours, after which the contents were blown out into broth tubes The results were as follows

---

[3] In this method the leucocytes do not after three hours appear to wander farther away from the red clot when they have no special stimulus attracting them

Staphylococcus emulsion.	Strength in which flavine acted on the bacteria						
	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	Control
Strong	Growth	Growth	Growth	Growth	Growth	Growth	Growth
Weak	0	0	0	0	Growth	Growth	Growth

These two experiments show clearly that the number of microbes on which an antiseptic has to act either in broth or serum plays an important part in the determination of the lethal concentration of an antiseptic We see also from Experiment 6 that in respect of changes in the number of microbes flavine is much more sensitive than is carbolic acid It follows from this that as the antiseptic has to act in wounds both heavily and lightly infected, this factor must be taken into account in any comparison of antiseptics

What is the Concentration of Flavine which will Inhibit the Growth of Microbes in Serum?

Experiment 8—Progressive dilutions of flavine were made in serum To one volume of each of these dilutions was added one volume of serum which had been implanted with the microbe used in the test

As some microbes grow badly in serum and do not macroscopically show evidence of growth, I added to the serum in some cases 1 20th of its volume of trypsin (which was just in excess of the quantity necessary for the neutralisation of the antitryptic power of the serum) and sometimes 1 50th of its volume of 50 per cent. glucose solution. Trypsin made the serum a good cultivation medium, and the glucose was acted on by the microbes with the production of acid in the case of cocci and acid and gas in the case of *B coli* and *B proteus*

These experiments were conducted in miniature test tubes and after the mixtures had been made in the tubes melted vaseline was poured on the surface of the cultivation fluid to make a layer about 1 cm. deep This vaseline protected the fluid from outside contamination and at the same time it was forced up the tube by any gas that was formed in the cultivation fluid It served as an easy method of measuring the amount of gas and giving some index of the amount of growth

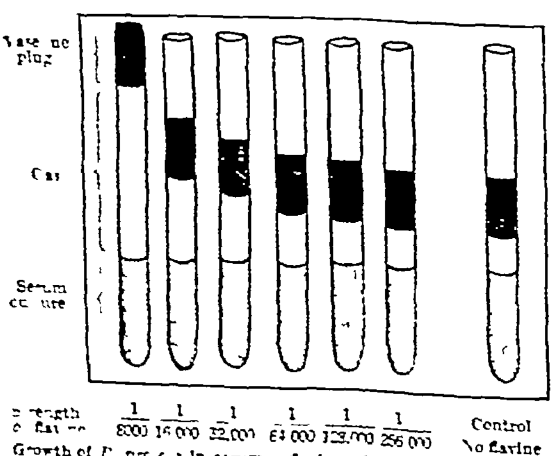
In these experiments the number of microbes implanted was not estimated but in all cases it was considerable (usually a loopful of bacteria from an agar culture was emulsified in about 5 c.c of serum)

The results are set forth in Table IV

TABLE IV—*Inhibitory Action of Flavine on the Growth of Microbes in Serum*

No	Organism	Medium.	Time of action of antiseptic	Lowest concentration of flavine in which no growth occurred	Greatest concentration of flavine which showed growth
1	Staphylococcus.	Serum–Trypsin–Glucose.	3 days	1 80 000	1 160 000
2			7	1 16 000	1 32,000
3	*B coli*		13 hrs	—	1 1000
4	*B proteus*		36	1 1000	1 2000
5		Serum – glucose	7 days	1 4000	1 8000
6	*B coli*		7	1 2000	1 4000

FIG 2



Growth of *B proteus* in serum – flavine showing the great increase of growth (as evidenced by increased gas production) in the stronger dilutions of flavine ([illegible] actual size)

Experiment 4 of Table IV requires special mention At the end of 36 hours the tubes containing the three strongest concentrations of flavine—namely 1 in 1000 2000 and 4000—were opened and examined Pure growths of *B proteus* were obtained from all of them The remaining tubes were left standing on the bench, and after one month it was noticed that they showed a gradual increase in the amount of growth as evidenced by the gas formation, from the control tube, in which there was no flavine, to the tube containing the greatest concentration of flavine (1 in 8000) The diagram (Fig 2), drawn to scale, represents the height of the gas column in the various tubes

The increase in the gas formation in the stronger flavine concentrations indicates that in some way flavine had favoured the growth of the microbes, and the regularity of the increase further proves that it is not accidental but is actually due to the flavine, as the contents of the tubes are identical except as regards this substance Experiment 5 of Table IV confirmed this result

Antiseptic Value of Flavine in Serum

It has been shown in Table IV when dealing with the inhibitory action of flavine on the growth of microbes in serum that staphylococci can grow in 1 in 32,000 flavine *B coli* in 1 in 1000, and *B proteus* in 1 in 2000 Experiment 7 also shows that sterilisation of a strong staphylococcus emulsion is not effected by a 1 in 20 000 dilution of flavine, although when using a weak emulsion 1 in 160,000 is sufficient to kill all the microbes (This last figure is practically the same as the figure given by Browning as the lethal concentration of flavine in serum on staphylococci.) In another experiment in which I used a large number of staphylococci I found that growth resulted after a 24-hour exposure to a 1 in 2000 dilution of flavine in serum Usually however when a fairly strong staphylococcal emulsion is used complete sterilisation is effected in 24 hours by a 1 in 4000 to a 1 in 16 000 dilution

Flavine 1 in 8000 in serum sterilised a *B coli* emulsion containing 1500 million living organisms per c c, while 1 in 64,000 sterilised an emulsion of 4000 *B coli* per c c

Antiseptic Value in a Non serous Medium

Table III gives details of the antiseptic value of flavine in nutrient broth, from which it appears that in 23 hours a 1 in 6000 dilution failed to sterilise a strong emulsion of staphylococcus while a 1 in 256,000 was capable of sterilising a very weak emulsion.

It was found that when flavine was added to a 48-hour-old broth culture of staphylococcus in sufficient quantity to make a 1 in 1000 solution it was unable to kill all the cocci in 24 hours at 37° C Carbolic acid 1 in 100 rendered a similar culture sterile in less than six hours

Antiseptic Power of Flavine in Blood in Vitro

Experiment 9—Progressive dilutions of a 1 per cent. flavine solution were made in defibrinated human blood and one volume of each of these was mixed with one volume of the same blood containing staphylococci Two sets of experiments were made the only difference being that the staphylococcal emulsion was 100 000 times as strong in the one as in the other The mixtures were incubated at 37° C for 24 hours and then planted into broth. The results were as follows:—

Staphylococcus emulsion	Concentration of flavine					—
	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	Control
Strong … … …	0	Growth	Growth	Growth	Growth	Growth
Weak … … … …	0	0	0		„	

This experiment shows that the antiseptic action of flavine is much weaker in blood than it is in serum

Action of Flavine on Pus

When strong solutions of flavine are mixed with equal parts of pus they cause a very marked agglutination of the pus cells and after incubation it can be seen that the pus in such a mixture has become mucoid in consistency This mucoid alteration of the pus which is probably due to the destructive nature of flavine on the cells, is noticeable up to a 1 in 6000 dilution In wounds treated with flavine this mucoid appearance of the pus is sometimes manifest and it may be that this will interfere with the distribution of the antiseptic. As in wounds however there appear to be so many factors which interfere with the action of flavine that it is unnecessary to lay much stress on this

Antiseptic action in pus—In these experiments flavine in saline solution was thoroughly mixed with pus from wounds either in equal parts or in the proportion of 1 part of flavine to 9 parts of pus The specimens of pus were obtained from wounds in different stages of healing, and they differed materially in the nature and the number of microbes contained in them No account was taken of the spore-bearing anaerobes as we were dealing here only with the action of flavine on the vegetative forms of bacteria In all cases the antiseptic was allowed to act on the pus for 24 hours at 37° C, after which a sample of the mixture was planted on agar or into broth Seven specimens of pus were subjected to the action of flavine in a concentration of 1 in 1000 and in only one of these was sterilisation effected In the other six specimens the resultant cultures did not differ as regards the variety of microbes from the control cultures Staphylococci, Streptococci, coliform bacilli, *B pyocyaneus* and *B proteus* all survived the action of flavine We see, then, that flavine is a relatively weak antiseptic in pus, and that in only one case was a concentration of 1 in 500 (twice the strength recommended for use in wounds) capable of sterilising an equal volume of pus

It is obvious that there is something in pus which prevents the action of flavine on the microbes The concentration required to kill microbes in pus is far greater than that required in serum, although the liquor puris is of a serous nature The simplest explanation of this is that the pus cells have a greater attraction for flavine than have the microbes In this connexion some experiments were made on the quenching' power of pus on flavine

Experiment 10—Equal quantities of flavine (1 in 500) and pus were mixed and immediately centrifuged The antiseptic power of the supernatant fluid was then tested on staphylococcus emulsified in serum and compared with the lethal power of fresh dilutions in serum of flavine (from a 1 in 1000 solution in normal saline) on the same emulsion of staphylococci The ' quenched" flavine undiluted was just capable of sterilising this serum in 24 hours but a twofold dilution was insufficient whereas with fresh flavine complete sterilisation was effected by a 1 in 8000 dilution

We see then that by contact with an equal volume of pus a 1 in 500 dilution of flavine loses 7/8ths of its antiseptic power almost immediately

Experiment 11—Flavine dilutions 1 in 100, 200 400 and 800 were mixed with equal volumes of pus and centrifuged immediately The intensity of the colour in the supernatant fluids were tested by putting equal sized drops of these on a white filter paper and matching these with a series of similar drops of progressive dilutions of fresh flavine By this method it was found that the two strongest flavine dilutions exhausted with pus had lost half, the 1 in 400 dilution had lost 2/3rds, and the 1 in 800 had lost about 5/6ths of the colour intensity

These two experiments show clearly that flavine by intimate contact with pus loses a large part of its power practically immediately

The results of the absorption of flavine by pus cells naturally leads to the question of the affinity of other cells of the animal body for this substance, and the following experiments were designed to give some indication of what happens when flavine is injected into the body

Browning and his co-workers state that flavine (1 in 1000) can be administered intravenously without toxic effect, and because of this non toxic action flavine has been used intravenously as a therapeutic measure in conditions like streptococcal septicæmia in the hope that the dye will have a directly lethal effect on the cocci in the blood

Experiment 12—A rabbit, weighing 3 lb was injected intravenously with 10 c c of flavine (1 in 1000) Blood was taken before immediately after and again 15 minutes after the injection The sera which separated from these blood specimens did not show the slightest trace of the canary yellow colour of flavine or any fluorescence and none of them had the slightest bactericidal effect on staphylococcus or inhibitory power on the growth of this organism The urine which was bright yellow had no bactericidal power on staphylococcus

We see therefore that flavine is immediately removed from the blood, which does not acquire any bactericidal action, and that therefore there is no justification for the therapeutic use of flavine intravenously as an antiseptic

Browning and his co-workers have recommended the injection of flavine into the tissues as a means of preventing the spread of infection As it is impossible to recover the flavine injected this way, I tried to get some idea of the fate of this substance when injected into closed spaces by introducing it into the pleural and peritoneal cavities of animals

Experiment 13—Two c c of flavine (1 in 100) were injected intraperitoneally into a three quarters grown rat. Two hours afterwards the rat was killed and it was found that all the tissues of the body with the exception of the brain were coloured bright yellow Serum from the heart blood showed not a trace of the yellow colour of flavine The urine was bright yellow The peritoneal fluid urine, and blood were found to be without antiseptic power on staphylococcus

Experiment 14—Two c c of flavine (1 in 100) were injected into the pleural sac of a full-grown rat Death resulted within two hours All the tissues were bright yellow except the brain. The blood serum was distinctly yellow The pleural fluid and the blood serum failed to kill in 24 hours a few staphylococci

It follows from these experiments that when flavine 1 per cent is introduced into a closed cavity in the animal body it loses its antiseptic power within two hours Much more rapidly, then, will the (1 in 1000) solution recommended for use lose its potency

It might be argued that when flavine is introduced into the body it is immediately taken up by the muscles, connective tissues, &c., and that these are the tissues in which flavine would be useful in combating a severe local infection On theoretical grounds it is unlikely that when these tissues have such an affinity for the dye they will give it up to bacteria, but I tested this in the following experiment

Experiment 15—22 c c flavine (1 in 1000) were injected intravenously into a small rabbit Death resulted immediately Within half a minute blood was drawn from the heart and serum from this was distinctly yellow Five minutes later another sample of blood was taken from the subclavian artery and showed no trace of yellow colour thus proving that all the dye injected had been taken up by the tissues All the organs and muscles were a bright yellow colour A leg was amputated and into one of the muscles a small quantity of a broth culture of *B perfringens* was implanted In four hours at 37° C. there was obvious growth of the organism with gas formation. Portions of all the organs were planted with small amounts of *B perfringens* and growth resulted in every case

This experiment shows that flavine introduced intravenously, even in a dose far greater than would be given to man, is incapable of conferring on the tissues any inhibitory power against the growth of a microbe such as *B perfringens*

The great affinity which muscle tissue exerts towards flavine can be shown also by grinding up 1 gm of muscle with 1 c c of flavine 1 in 1000 and testing the colour intensity of the resulting free fluid This colour will be found to be reduced to about one-eighth of its original strength

The Action of Flavine in Wounds

Browning has scouted the suggestion that the potency of an antiseptic in pus gives much indication as to the value of such an antiseptic in a wound.[4] Of course, in dressing a wound all the pus in the cavity should be washed away before a fresh dressing is applied, but the exudation from the walls of the wound will consist of a serous fluid with a larger or smaller number of cells and a variable number of microbes, some inside the cells and some free This fluid, then, is not far removed from pus, and it is in this fluid that the antiseptic applied is first going to act Also the antiseptic and the fluid are not going to be intimately mixed as in test-tube experiments, but the antiseptic has to penetrate into the fluid by diffusion Thus the test tube experiment appears to be the less severe test for the antiseptic.

The action in this purulent exudate is only going to throw light on what is happening in the cavity of the wound, and any antiseptic, before it can begin to approach the ideal, must act beyond the cavity in the infected walls of the wound Here it would have to act in a tissue composed largely of cellular elements and bathed in a serous fluid No claims were made as to the penetrative powers of flavine, but in the light of the experiments quoted above, which show that the muscular tissues and the leucocytes have a very great power of reducing the potency of flavine, it is hardly conceivable that any penetrative power can exist Any antiseptic action of flavine, therefore, would be confined to the cavity of a wound, and, as it must act in the cavity in a fluid akin to pus, we have seen from the above experiments on its antiseptic action in pus that its potency when applied as is recommended in a 1 in 1000 dilution can only be very weak, much weaker, indeed, in regard to the concentration used than would be carbolic acid

We have also seen that flavine, although it appears to have little action on the leucocytes in a few minutes, has a most destructive effect when its action is prolonged over some hours, an effect greatly in excess of its lethal action on bacteria Let us consider what this may mean in a wound cavity The leucocytes when they first appear would not be hindered from ingesting the microbes Soon however they would themselves fall victims to the toxic effect of the flavine, and it is likely that this would occur before they had time to destroy the microbes ingested The flavine itself would be unlikely to have killed the microbes before they were ingested, as its lethal effect on bacteria is a very slow one It has been shown that the ingestion of microbes by leucocytes serves as a protection of such microbes against antiseptic solutions Thus the slow toxic action of the flavine on the leucocytes instead of being a virtue, may actually allow the bacteria to be protected against any antiseptic powers which flavine may possess

“Therapeutic Coefficient”

Lastly, we might shortly consider the value of the so called "therapeutic coefficient" as an index of the value of an antiseptic This has been defined by Browning and his co-workers as the concentration which reduces phagocytosis 50 per cent divided by the concentration just sufficient to kill bacteria in serum A consideration of the text of their article, however, shows that it really amounts to a comparison of the toxicity to leucocytes with the toxicity to bacteria (acting in serum) The experiments which I have detailed above show clearly that in regard to flavine this coefficient, as arrived at by the authors of the expression, gives information so misleading that as a practical test it is quite valueless In calculating the toxic power of substances towards leucocytes they apparently paid no attention to the time factor, but in all cases used 20 minutes only as the time during which the action on leucocytes was observed It would seem obvious that just as antiseptics act quickly or slowly on bacteria, so they will act quickly or slowly on leucocytes Thus in the 20 minutes allowed only the antiseptics which acted rapidly on the leucocytes (and probably also on the bacteria) showed anything like their true effect If we take flavine as an instance of how neglect of the time factor permitted quite wrong conclusions to be drawn, we see that the numerator of the "coefficient" in 20 minutes is 1 in 500, whereas it is over 1 in 2,000 000 if 24 hours is the time allowed Thus by a small alteration in the experimental method we get an alteration of the coefficient by at least 4000 times to the detriment of flavine

---

[4] Browning: Brit. Med Jour, Feb 3rd 1917

Again, the "lethal concentration" on bacteria in serum is a very variable quantity, and it has been shown above that by altering the strength of the bacterial emulsion the lethal concentration to staphylococcus can be varied from 1 in 2000 to 1 in 160,000, or a variation of 80 times

We see, therefore, that in respect of flavine the numerator of the "therapeutic coefficient" is subject to a variation of at least 4000 times and the denominator to a variation of 80 times This is quite sufficient to show that the coefficient is worthless as a standard of antiseptic value Browning and his co workers in their calculations of the "therapeutic coefficient" of different antiseptics happened to choose all the conditions which favoured flavine—namely, a long period of action on the microbes, a serous medium in which to test the bactericidal action, a few microbes to kill and a short period of action on the leucocytes Thus they obtained a coefficient for flavine 800 times better than that given by carbolic acid If however, they had used many microbes and had allowed the antiseptics to act on the microbes and leucocytes alike for 24 hours they would have found that carbolic acid gives a coefficient at least ten times better than flavine where serum is the medium employed, or 250 times better if the lethal concentration were estimated in pus

The experiments detailed in this paper show that the theoretical basis for the use of flavine is thoroughly unsound, and that there seems nothing to specially recommend this substance as an antiseptic for use in septic wounds

Summary

1 Flavine strongly agglutinates human red corpuscles up to a dilution of 1 in 3200

2 Flavine has a strong anticoagulant effect on human blood

3 Flavine in a concentration of 1 in 2000 completely inhibits leucocytic emigration

4 Flavine has a very destructive action on leucocytes, and if the action on leucocytes and bacteria be each tested for 24 hours its leucocidal action is far in excess of its bactericidal action.

5 The number of microbes on which an antiseptic has to act has a very marked effect on the "lethal concentration" of the antiseptic

6 This alteration of the "lethal concentration" with the number of microbes varies in degree with different antiseptics, and appears to be especially marked in the case of certain aniline dyes This factor must in all cases be taken into account in any comparison of antiseptic values

7 When many microbes are used it requires a much greater concentration of flavine to effect sterilisation than that given as the ' lethal concentration by Browning and his co workers

8 In serum under certain conditions staphylococci will grow in 1 in 32,000 flavine, *B coli* in 1 in 1000 and *B proteus* in 1 in 2000

9 Flavine 1 in 8000 appears to aid the growth of *B proteus*

10 Flavine 1 in 500 is usually unable to sterilise in 24 hours an equal volume of pus from a wound

11 Flavine injected intravenously in large doses immediately disappears from the blood, which acquires no bactericidal power, and is taken up by the tissues, which become yellow but acquire no inhibitory power on the growth of bacteria

12 Flavine 1 in 100 injected into the pleural or peritoneal cavities loses its antiseptic power within two hours

13 Flavine is rapidly absorbed by pus or muscle tissue

14 The so-called "therapeutic coefficient" of flavine can be changed with slight variations of the experimental method by at least 300,000 times

15 If the antiseptic is allowed to act on staphylococci and leucocytes alike for 24 hours and the ratio is taken of its toxicity to both of these, carbolic acid has a coefficient 10 times better than flavine when the antiseptic acts on the microbes in serum and 250 times better when the bactericidal action is estimated in pus

---

NERVOUS UNREST IN THE INFANT AS A CAUSE OF THE FAILURE OF BREAST-NURSING

BY H CHARLES CAMERON, M D CANTAB,
F R C P LOND,
ASSISTANT PHYSICIAN AND PHYSICIAN IN CHARGE OF DEPARTMENT FOR DISEASES OF CHILDREN GUY'S HOSPITAL.

IN THE LANCET of Sept 27th, 1913, I published a paper upon the causes of the failure of women to nurse their infants at the breast I then urged that in the first establishment of the milk flow the part played by the mother was essentially a passive one, and that her contribution towards a successful result was limited to providing a nipple sufficiently large for the child to grasp firmly If the nipple was well developed the causes of failure were commonly to be found not in the mother but in the child I maintained that we had to distinguish between circumstances which prevented or delayed or interfered with the establishment of milk during the early weeks of lactation and circumstances which shortened the period of efficient lactation in the later months, and that the former—save in the all important question of the nipple—were concerned chiefly with defects in the child, while the latter were commonly dependent upon the condition of the mother

Among the causes which interfere with the suction of the infant, and so with the proper establishment of the milk supply, I enumerated the following (*a*) Dyspnœa from nasal catarrh, adenoid vegetation, the snuffles of congenital syphilis, bronchitis, or congenital heart disease (*b*) Infective or toxæmic states of all sorts, with or without pyrexia (*c*) Conditions such as cleft palate facial paralysis, Bednar's aphthæ, or stomatitis which interfered mechanically with suction (*d*) Prematurity and congenital debility Further, I referred to the adverse influence of mixed feeding instituted soon after birth in the hope of preventing the supposed ill effects of the period of physiological inanition which precedes the "coming in" of the milk, and I laid stress upon the danger of chilling the infant, a disaster which is apt to occur in weakly babies unless carefully graduated artificial heating takes the place of the warmth of the mother's body

The dyspnœic child lets go the nipple from exhaustion and because he cannot breathe and suck at the same time. The premature child and the child deprived of sufficient heat are sometimes too somnolent to sustain a sufficient effort The infected child may have no appetite or desire for food The child who has sucked once or twice from an easily running bottle may obstinately refuse the exertion of pulling at a still empty breast The child with a cleft palate or facial paralysis cannot maintain the necessary vacuum

Nervous Unrest in the Infant

I wish now to call attention to another defect in the child which, in my experience, is not uncommonly a cause of failure to nurse successfully—the inhibition of the sucking reflex by the infant's nervous unrest and excessive emotional display In the young infant the act of suction is not voluntary but reflex. It proceeds perfectly, as has often been observed, in an acephalic monster which is provided only with medullary centres This reflex act of sucking is produced by stimulation of the lips and tongue A finger placed upon the dorsum of the tongue in a certain position will instantly provoke a powerful movement of suction The reflex fails to appear if the child is too somnolent and inert It will also fail to appear if inhibited by extreme emotional excitement In some infants, generally of pronounced neurotic inheritance, the sudden change of environment which accompanies birth is capable of arousing a veritable nerve storm New sensations of pressure and of heat and cold which stream into their consciousness produce a paroxysm of unrest The infant starts convulsively at the gentlest touch, at a bright light, or a loud sound Sleep is resolutely refused, and wild, hysterical crying may last for hours at a time All this unrest increases the need for food, and, until effective suction has drawn the milk into the breast, no food is forthcoming The normal child spends almost all the first 24 hours in deep sleep, until he is roused by the oncoming sensations of hunger The baby whose nerves are on edge and who shows it by incessant, angry crying and restless movement, is likely to suffer much earlier as well as much more severely from the sensation of hunger If when put to the breast he sucks strongly, then the vigour of his suction soon produces its own reward in the early appearance of the milk, and all is well Unfortunately this is not the usual result of this excessive emotional display Too often the nervous unrest inhibits the sucking reflex Crying, spluttering, and gulping, the child mouths and bites at the nipple without fastening on, or, throwing back his head, continues to squirm and struggle without taking any notice of the proffered breast Hunger adds to the unrest, and unrest to the hunger, until everyone is tired out, the attempt at nursing is abandoned, and artificial feeding is begun With the bottle the difficulty does not persist in the same degree, partly because its flow is so readily produced by a minimum of suction, still more because, while it is almost impossible to follow with the mother's nipple the restless movements of the wriggling little face and mouth, it is easy enough to keep the teat of the bottle in position

The constant crying has a further disadvantage in the ill effect it has on the mother After the distress and pains of labour many women are in no condition to bear any further nervous strain The pitiful crying and the repeated unsuccessful attempts are both exhausting to her and depressing Unless we can intervene with successful treatment we cannot expect the mother to wait patiently and hopefully in the assurance that in the end all will come right Fortunately, it is a condition which is comparatively amenable to treatment

General Treatment

A great deal can be done by simple measures, by insisting upon a half darkened room, a warm soft bed, and absolute quiet The infant should be handled as little as possible, and when lifted the movement should be steady and gentle Dandling the baby in arms, patting him on the back, expostulating with him, and talking to him generally only make matters worse If by measures such as these a few days' sound sleep can be secured our difficulties are at an end It is a proper practice to put babies to the breast at regular intervals Ordinary babies of sound nervous organisation soon learn to adjust their appetites to routine and crying and restlessness begin only when the meal is due and are not excessive With the neurotic infant we shall wreck all by a too strict adherence to a rigid scheme and time-table With such a child after a passionate fit of crying lasting a quarter of an hour or more nursing may be most unsatisfactory Either the crying continues and the child takes no notice of the breast or after drinking rapidly, with much gulping and spluttering, he suffers immediately torments of indigestion, with renewed crying and restlessness Digestion is inhibited by excessive emotional display in infants as in adults With such children our only chance of success is to be active in seizing every reasonable opportunity that presents itself, having regard to rational time limits, to get the child to the breast while he is still asleep If very gently the slumbering child can be brought to the breast before he wakes with that convulsive start which is immediately followed by a storm of crying if while he still lies between sleeping and waking the nipple can be gently inserted into his mouth, the sucking reflex comes to its own again and not only is the breast drained steadily and well but the subsequent process of digestion is much more likely to be undisturbed The ordinary conditions of nursing routine, in a sense, must be reversed Till the nervous system becomes quieter we must feed the baby not when he wakes but when he sleeps

Medicinal Treatment

If opportunities for feeding the child are not sufficient—that is to say, if it is impossible, with all care to avoid stimulation, to find sufficient occasions when with the child asleep a meal is even approximately due—then it is not a difficult matter to increase their number For this purpose chloral hydrate is peculiarly suitable I have found that its effect in quieting the child and producing sufficient somnolence to allow the sucking reflex full play is much more marked, more certain, and more immediate than that of potassium bromide It should be given 20 minutes before the intended meal time. One grain is usually enough for a very young baby, dissolved in a teaspoonful of water with a little syrup of orange. I have sometimes had to adopt this manœuvre before each of five or six meals in the day, but, as a rule, three grains in the 24 hours will be sufficient, because other opportunities of feeding the child after sound sleep and, if possible, without rousing him, will present themselves In cases in which the diagnosis of the cause of the unrest and of the secondary dyspepsia is well established the most satisfactory results may follow this treatment. It is at least possible in a given case to put the matter to the test and to be guided by the result. I have very often demonstrated in the out-patient department how the restless, crying baby will utterly refuse to suck, and yet, after receiving a single grain of chloral and being put to rest quietly for 20 minutes, will draw the breast with regular, deep, and uninterrupted suction

The *nervous dyspepsia* of infants is controlled in the same way more efficiently by chloral than by any other drug The children often have a distinct neurotic inheritance *They are thin and meagre*, but, in contrast to what is usually found in primary dyspepsia, their muscular tone is often excessive The limbs are a little rigid, and the abdomen is often retracted rather than distended, with the outline of the recti muscles unduly apparent Their movements are very strong and powerful They wriggle all the time and the mother usually complains that they "almost jump out of her arms" They cry almost incessantly If fed after crying digestion *appears to* be a *most* painful process *Regurgitation* of food, sometimes explosively, is *common*, Without actual diarrhœa—that is, without change in the character of the stools—the bowels are often open eight or ten times in the day Instead of two or three large motions there are often very many small evacuations passed with much wriggling and grunting The taking of food is almost always followed by the passage of a stool and the "changing" and *cleaning necessary* rouse the child to crying and upset the sleep that should accompany digestion Treatment of this form of dyspepsia by ordinary measures is not successful The usual routine limitation of the food is actually harmful, for the child stands hunger very badly and the nervous unrest is directly increased As a rule, the symptoms yield to suitable doses of chloral and bromide With sound, deep sleep the digestive processes are no longer inhibited by mental irritation and the needs for food fall to a much lower level because the muscular work is promptly diminished.

I am loth *to* suggest further drug taking for babies—*they* suffer now I think from excessive prescribing—*but* I believe that the judicious use of small doses of chloral in this way will be found to be effective in preserving the breast-milk for a considerable number of nervous babies of nervous mothers, and in combating the gastric and intestinal hyperæsthesia which seem to be dependent upon excessive emotional display on the part of the child The diagnosis of the condition and its differentiation from primary dyspepsia or from dyspepsia due to infection, with secondary nervous unrest is not always easy *But to* determine the cause of the failure of nursing *in the first* few weeks of life is often enough difficult The pity *is* that it is sometimes not even attempted

SOME PRINCIPLES OF PLASTIC SURGERY

INCISIONS CONTOUR, AND THE SUTURE

BY J L AYMARD M R C S, L R C P LOND,
TEMPORARY CAPTAIN R A M C QUEEN'S HOSPITAL, FROGNAL, SIDCUP KENT

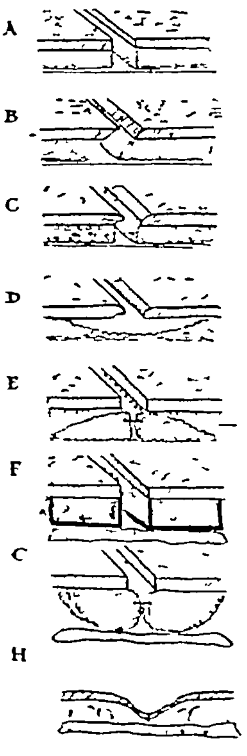
THE prime factors of artistic work in the department of plastic surgery are the restoration of contour and the correct method of suturing The disappointing appearance of much careful plastic work is vaguely recognised by the untrained observer who has any artistic perception, the trained artist sees at once that the essential thing which is so frequently absent from work which is otherwise admirable is the right degree of fullness which would have restored a flat surface to its normal contour

The three important factors, which I propose to deal with here necessary to bring about a contour as nearly normal as possible are first, the correct method of incising the skin, secondly, the manipulation of the deeper structures, and, thirdly, the best method of bringing about satisfactory union The other equally important factors, such as freedom from sepsis, condition of patient, &c, are already well known

The Skin Incision

In dealing with the question of skin incision we are, as far as I know, limited to two methods the one in which the skin is divided at right angles to the surface and the other upon the slant The latter method was fully described in THE LANCET some 11 years ago[1] and demonstrated by me in Sir Arbuthnot Lane's clinic at Guy's Hospital. Two years later it was discovered by the Germans and later by the Americans in each case without acknowledgment Having practised this incision continuously since this period, I may be permitted to draw attention to its value again, especially since it is now so frequently used in plastic surgery in this country to-day

FIG 1.



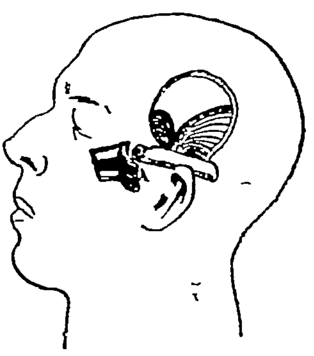
A Ordinary incision at right angles to surface of skin
B Author's incision upon the slant
C Appearance assumed immediately after incision
D To demonstrate undercutting of skin
E Ordinary fat flap
F Author's deep tissue flap incision for
G Author's deep-tissue flap rolled in position
H Deep scar with loss of tissue

A, Fig 1, is intended to represent the usual incision at right angles to the surface, B, that in which the skin is incised upon the slant At the moment of incision the actual appearance is doubtless as represented but almost immediately the condition of C is produced The upper flap assumes a curved form and the under one a convex The actual edge of the skin of the upper flap presents an appearance (not illustrated) resembling the cutting edge of a saw and not unlike a fringe This condition is due to the fact that the skin is not flat but on the contrary, a series of ridges and holes This ragged edge must often have been observed by surgeons when commencing the incision for a Thiersch graft The surgical importance of the contracted rolled in edge of the upper flap is that it is liable to be cut off if the knife is introduced twice instead of making one clean incision My slanting incision is very suitable for incisions in the neighbourhood of the cheek the mouth the chin and the forehead but around the eye and in the neck where the skin is loose and mobile the right-angle one is the more suitable

Method of Dealing with the Deeper Structures

Having dealt with the skin incisions, we have next to consider how the deeper tissues must be dealt with in order to fill up the gap produced by the excision of a depressed scar as illustrated at H, Fig 1. Leaving out the question of free grafts and the introduction of foreign bodies, we have only the fat and neighbouring tissues to make use of Provided the depression is only slight, simple undercutting, as represented at D may suffice A common method, however, is to undercut the skin and divide it from the fat as represented by the dotted line in E, rolling it together as shown, but the method I much prefer and now almost always employ is shown in F The thick black lines represent the undercutting straight down to the bone, and in the direction of the arrow marks up to the skin, the block is thus dependent upon the skin flap for its blood supply These blocks of tissue can then be easily rolled inward, as G, and secured with catgut, thus filling up the gap and restoring the contour

FIG 2



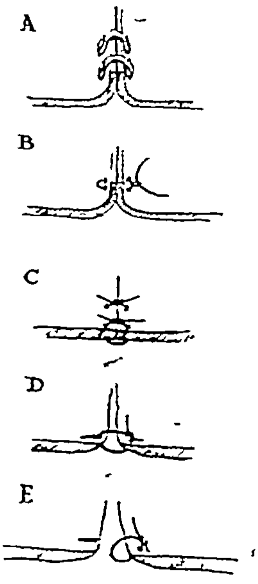
Major H D Gillies's temporal muscle flap

An ingenious method of deep-tissue adjustment is that devised by my colleague, Major H D Gillies, to fill up depressions caused by loss of malar bones The diagram, Fig 2 shows how he partially separates, and turns down under a bridge of skin, a portion of the temporal muscle I have seen some excellent results due to the employment of this method

Method of Suturing

The next question is how to adjust the skin Until fairly recently I have endeavoured to bring the edges of my incision into perfect apposition with the hope that they would so remain but, in a large plastic operation with the knowledge that I should have to recognise that the result was ordinarily successful if as many as two-thirds of my sutures held in position, taking into consideration all the troubles so frequently attending such an extensive operation, I am now satisfied to sacrifice any immediate cosmetic appearance in the theatre for what I know to be the better method of attaining an ultimately good result I have long suspected that the appearance of a wound two days after operation was deceptive—that is to say, that whilst the interrupted suture still held the cuticle only was in contact and that a condition resulting in D, Fig 3, was in fact, in existence to be followed by E or in the long run the alternative of an otherwise unaccountably wide scar

FIG 3



A, Michel's clip as ordinarily used
B, Mattress suture now extensively used by author
C, Interrupted suture.
D Appearance of skin edge with slight tension
E, Complete break-down appearance of

Every general surgeon must have been struck by the small linear scar invariably produced by the use of the Michel clip, A Fig 3 which is clearly due to the apposition of a substantial surface of the two edges which subsequently stretch into approximately the normal position. Whether the skin be cut upon the slant or at right angles I now almost entirely employ the mattress suture (B Fig 3) which gives the same result as the Michel clip The clip is not suitable for the face because it occupies too much space and is difficult and painful to remove in this region The mattress horsehair suture, on the contrary, cuts quickly through the cuticle, but holds the deeper tissues until union is secured, despite moderate tension and even suppuration, should it occur This, however, is not meant to imply that I neglect in the least the additional safeguard of that most valuable adjunct in plastic surgery—the relaxation suture, whether in the form of the corrugated vulcanite disc with silkworm gut or my wire and clip method

A METHOD OF APPLYING ANTISEPTICS TO THE DEEPER PARTS OF WOUNDS

BY THOMAS H KELLOCK, M C CAMB , F R C S ENG ,
CAPTAIN, R.A M C (T)

THE multitude of septic wounds at the present time, which occupy the attention of so many medical men, has very naturally given rise to the use of a variety of antiseptics and many methods of application. To judge of the efficiency of the former due attention should be paid to the latter, and it is obviously unfair to judge of the value of an antiseptic when it is only applied to the part of a wound that is visible In every wound of any magnitude there must be recesses and deep parts into which, however well such a wound may be drained, the antiseptic applied in this way never reaches and where organisms may collect and multiply unmolested.

The Carrel method of irrigating wounds has done a good deal to improve their treatment and has drawn attention to the advantage of applying antiseptics to the deeper as well as to the more superficial parts of wounds The method, however, has certain disadvantages The tubes generally used are perforated with round holes for some distance from the closed end, and if there be much resistance to the exit of fluid at the deepest part the solution finds its way through the openings nearer the surface of the wound and so the deeper parts are not reached

These tubes, too, act to a certain extent as drains Pus finds its way into them through the openings and is washed back into the wound again when fluid is allowed to flow Another disadvantage of the method is the necessity of keeping the patient still Movement on his part is apt to cause the tubes to be drawn out of the wounds, and it is not at all an uncommon experience to find tubes that were originally inserted deeply into a wound lying only just under, or even on the surface

Attempting to improve on this, I have found the following method of much service Taking a piece of drainage-tube about 8 or 10 inches in length and of calibre about equal to that of a No 8 catheter, the end is securely closed by a ligature and a small oblique incision made with sharp scissors as near as possible to the closed end The incision should cut a small valve with apex directed towards the closed end—the more oblique it is the better—and should at its base divide one third of the circumference of the tube (see figure, A) This incision will be found to act as a most efficient valve, opening under very slight pressure from within and preventing any regurgitation of pus or of the irrigated fluid The tied end should be inserted to the very depth of the wound and the free end of the tube left projecting through the dressings, the number of tubes used must depend on the size and character of the wound, but it will generally be found that one, or at the most two, will suffice

A

B

In cases of a perforating wound of a limb or of a wound with two openings widely separated a very useful modification is to ligature the tube at its centre and cut a valve on each side of the ligature and pointing towards it (B) This is passed through the wound and the irrigation done from both ends In this way any fluid that is irrigated into the free ends of the tube must certainly find its way to the very bottom of the wound and from there towards the surface

To secure the tubes in position a useful plan is to make a small independent incision through the skin near the edge of the wound just large enough to grip the tube without occluding its lumen, and the free end of the tube is drawn through this after the tied end has been passed to the bottom of the wound The free ends of the tubes are left outside the dressing and the irrigating fluid passed into them by means of a glass syringe Gravity alone will generally suffice, but, if necessary, a little assistance may be given by using the plunger of the syringe If only a small quantity of fluid be used at a time the dressings on the wound need only occasional changing I have been using flavine for this purpose One to two drachms of a 1 in 1000 solution is injected through the tubes twice in 24 hours, and the results in some very septic cases have been most satisfactory

A question on which I have not yet been able to satisfy myself completely is whether wounds treated in this way should be drained If free drainage is provided, the antiseptic fluid very readily finds its way to the surface and is absorbed by the dressings, and so is not able to remain in contact with the real surface of the wound I have sometimes thought that the best results have come about when the drainage is not free The walls of the wound then remain open and the mixture of pus and antiseptic fluid is brought into contact with the suppurating surface at all points

MEMBRANOUS CONJUNCTIVITIS FOLLOWING A SQUINT OPERATION

BY S JOHNSON TAYLOR, M B EDIN

RECENTLY I performed an advancement cum tenotomy operation for a convergent squint, in a girl aged 11 years, followed by a complication which I believe to be very rare I used three stitches for the advancement and one for the tenotomy part, which I did, as usual, by the open method All went well Two days later the upper eyelid was a little more swollen and glazed than is usual and the advancement-wound region did not look quite nice, this was soon succeeded by a definite dirty membranous area which I diagnosed clinically as diphtheritic, the tenotomy wound area quite escaping I at once had antitoxin injected hypodermically and used quinine lotion freely and frequently, as advised by Sir John Tweedy in "Diphtheritic Conjunctivitis," and slowly the condition cleared up, the stitches became very loose and either were cut out or came away The sloughy membranous patch involving the tendon and distal end of the external rectus was loth to disappear and did so very gradually, leaving a swollen granulation patch and a convergent squint as marked as before the operation The general systemic disturbance was very slight No bacteriological examination was made or was necessary, the clinical condition being quite sufficient to label the disease The patient had diphtheria last Christmas and two other of the children had it, and the baby with cleft palate has been for some weeks—before the operation—and still is in our isolation hospital as a carrier of the complaint

The ground behind the patient's house is soaked with sewage, there being no drainage system there I have mentioned this case to several of my London colleagues, but can find no parallel thereto The one attack of general diphtheria did not confer any immunity against the local affection I venture to state that this complication of a squint operation is excessively rare if not unique

Norwich

THE CLINICAL MANIFESTATIONS OF A DOUBTFUL CASE

BY M J PETTY, M B CAMB , F.R C S ENG

THE following case is recorded as a problem in diagnosis

Patient, girl, 6 years of age No evidence of other cases in family Mother and father both healthy When patient was 2 years of age a slight fit, with loss of consciousness, occurred, apparently complete recovery Four months later the child began to drag right foot along the ground, since then progressively getting worse till whole of right side of body was noticed to be affected Occasional vomiting occurred Bowels always regular A week ago she had another fit, leaving an apparent palsy of all the eye muscles Vomiting took place occasionally I was called in to see the child, as it was supposed that symptoms, &c , were due to a tumour near the quadrigeminal bodies

State —The child in poor general condition, lying in bed on right side, and complaining of localised pain over left occipital region which had been present for four days Mental condition quite clear, but speaks in a monotone and answers quickly and rationally The right hand is held in left hand, and moved about by latter Head measurement 50½ cm , regular in shape Examination of cranial nerves 1 Smell sense delicate—not the slightest impairment 2 No change in optic nerves and fundi , fields of vision normal Vision normal 3, 4, 6 Right side Pupil dilated and movements in all directions impaired , moves more than left Slight exophthalmos Left side Eye apparently immovable, but on persuasion child moved eye slightly in all directions Reaction to light good , reaction to accommodation could not be determined 5 No loss of sensation 7 Supranuclear lesion on right side , left side apparently normal 8 Hearing normal on both sides 9 Taste normal 11 Unaffected 12 Deviation to right side when tongue is protruded

Right arm Kept flexed over chest Some active flexion and extension of elbow and distal joints Grasps hand well but weakly Tendon reflexes absent No loss of sensation Arm, forearm, and hand muscles definitely atrophied Left arm Loss of tendon reflexes, but otherwise normal in all its movements, not showing an intention tremor Trunk Normal sensation Abdominal reflexes right side are absent, but are brisk on left side Sphincters normal Right lower limb Definite paresis compared with left Knee jerk absent, other tendon jerks also absent No ankle clonus Hallux erectus present Definite disuse atrophy present, limb is 2 5 cm shorter than its fellow No loss of sensation Left lower limb Stronger than right Movements well coördinated Knee jerk and other tendon jerks absent Ankle clonus absent Babinski's sign Extensor response

No scoliosis Definite contracture of post-vertebral muscles in occipital region Wassermann reaction negative (two occasions) Cerebro spinal fluid not examined Urine normal T about 99°F at night P 120 Heart, lungs, and abdominal viscera normal

Fits, intense headache, occasional vomiting and the eye symptoms suggested intracranial pressure, but of this there was no evidence on further investigation Friedreich's disease, with which much of the condition agrees, is excluded by the absence of definite ataxia and of hereditary transmission

Buenos Aires

PETROLEUM IN THE TREATMENT OF PYORRHŒA ALVEOLARIS

BY H J CORIN, L D S

THE treatment of pyorrhœa alveolaris should be undertaken by the dentist only in conjunction with the patient s medical adviser, since pyorrhœa is now commonly acknowledged to be aggravated by, if not actually due to, causes other than dental It is, for instance, in many cases primarily induced by the absorption of toxins from a septic small intestine, a condition which obviously needs skilled medical attention.

For such a condition purified petroleum is used widely and successfully, both in those cases where surgical interference is necessary, and also in those more common instances where no operation is required Most probably the therapeutic action of petroleum is known to the vast majority of medical men , but I would like to emphasise the caution given some time ago in this journal after various investigations,[1] that only the purest oil should be administered

In a case where there was only a slight discharge of pus from the gums one course of local treatment, the use of an effective mouth wash and the patient ordered to take petroleum emulsion, produced a complete cure The patient was unable to come to town for six weeks after treatment but seen at the end of this period there was absolutely no trace of discharge

For long standing cases where there is a large discharge I have found petroleum with guaiacol to give wonderful results in clearing up the conditions quickly, and when there is acute gingivitis petroleum with salol is useful After my experience I can confidently recommend this method of treatment as effective in many instances where other methods have failed

Reviews and Notices of Books.

Organic to Human Psychological and Social By HENRY MAUDSLEY, M.D Lond London Macmillan and Co , Limited. 1916 Pp 386 Price 12*s* net

THIS latest work by Dr Maudsley is fully worthy of the high reputation that has for long placed him in the front rank of contemporary scientific thinkers and writers on mental processes in health and disease His first book, the "Physiology and Pathology of Mind," published hard on half a century ago, showed his mastery of all then available knowledge of the structure and functions of the human nervous system, no less than his signal capacity for thinking scientifically It contained, moreover, the germs of much that its author has since from time to time given to us in his well known works expanded and illustrated by further experience and mature reflection Even as Dr Maudsley's earliest work drew the attention of philosophical thinkers more than that of practising medical men, so probably will this latest book appeal mainly to the scientific student of psychology and sociology whether without or within the ranks of the medical profession It must, indeed, be considered chiefly as an important contribution to the still vexed controversy between the warring schools of "materialists" or "mechanists" on the one hand, and of "vitalists" or "spiritualists" on the other Justly pre-eminent though Dr Maudsley is as an authority on the subject of insanity, and much as his other work owes to his practical knowledge and experience in this special study, his most enduring title to fame will be that of the scientific philosopher who in his day and generation consistently and persistently upheld the principle of the unity of the human organism and its continuity with the rest of Nature's processes

A true psychology ' (says Dr Maudsley in the first chapter of the book before us) "must be founded on a clear and distinct recognition of the essential continuity and constant flux of things in which all so-called causes are effects and all so-called effects causes mind be conceived in thought as a part of the nature which its organisation is in fact Continuity of motion without end, the perpetual flux which such old Greek philosophers as Democritus, Heraclitus, and Epicurus insisted on, and Lucretius poetically expounded that is the fundamental fact the world never the same for an instant, nor two minds ever the same, nor any mind ever the same for a single hour "

Again —

"Into the composition of every idea, of every mood, of every act, of every reflection, every organ and every gland of the body has entered essentially , the minutely different structures and physico-chemical changes and exchanges of the parts in different persons producing different temperaments, and the signally special organs of male and female bodies different mental qualities requiring their special direction of development and function To deride the notion of mechanism as anywise applicable to life and life in mind is the natural error of him who, ignorant of the exquisitely subtile physical and chemical precesses at work in the simplest vital substance, thinks grossly only of inert matter and its mechanism as exemplified in the structure of a wheel barrow or a steam engine "

One more quotation must suffice for the purpose of indicating some of the main lines of thought in this book —

"That all positive intelligence is sense-evolved, though true, is not the whole truth motor reactions contribute as essentially as sensory impressions to the construction of a mental organisation and fitly respond to them in the complex composition of ideas and judgments The old saying, *Nihil in intellectu quod non prius in sensu* might indeed be fitly supplemented by the addition of *et in motu* "

It is clearly apparent that no adequate criticism of the main arguments of this book is possible within the limits of this notice Even to attempt it would involve a useless plunge into a troubled sea of dispute. But this much may be said in some justification of the high degree of value which we attribute to it The least biassed thinker on matters psychological, who is dissatisfied with any theory concerning mental phenomena which involves the importation of a purely imagined and unverifiable agency in explanation, but still may find some difficulty in regarding such phenomena as natural products of organisation, is at least likely to discover, after carefully studying Dr Maudsley's book, that part, if not all, of his difficulty is lessened or removed The case for cuticle but holds the deeper tissues until union is secured, despite moderate tension and even suppuration, should it occur This, however, is not meant to imply that I neglect in the least the additional safeguard of that most valuable adjunct in plastic surgery—the relaxation suture, whether in the form of the corrugated vulcanite disc with silkworm gut or my wire and clip method

A METHOD OF APPLYING ANTISEPTICS TO THE DEEPER PARTS OF WOUNDS

BY THOMAS H KELLOCK, M C CAMB, F R C S ENG,
CAPTAIN R.A M C (T)

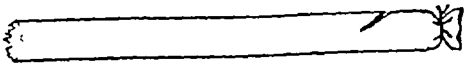
THE multitude of septic wounds at the present time, which occupy the attention of so many medical men, has very naturally given rise to the use of a variety of antiseptics and many methods of application To judge of the efficiency of the former due attention should be paid to the latter, and it is obviously unfair to judge of the value of an antiseptic when it is only applied to the part of a wound that is visible In every wound of any magnitude there must be recesses and deep parts into which, however well such a wound may be drained, the antiseptic applied in this way never reaches and where organisms may collect and multiply unmolested.

The Carrel method of irrigating wounds has done a good deal to improve their treatment and has drawn attention to the advantage of applying antiseptics to the deeper as well as to the more superficial parts of wounds The method, however, has certain disadvantages The tubes generally used are perforated with round holes for some distance from the closed end, and if there be much resistance to the exit of fluid at the deepest part the solution finds its way through the openings nearer the surface of the wound and so the deeper parts are not reached

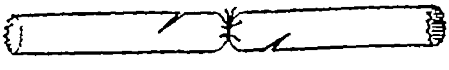
These tubes, too, act to a certain extent as drains Pus finds its way into them through the openings and is washed back into the wound again when fluid is allowed to flow Another disadvantage of the method is the necessity of keeping the patient still Movement on his part is apt to cause the tubes to be drawn out of the wounds, and it is not at all an uncommon experience to find tubes that were originally inserted deeply into a wound lying only just under, or even on, the surface

Attempting to improve on this, I have found the following method of much service Taking a piece of drainage-tube about 8 or 10 inches in length and of calibre about equal to that of a No 8 catheter, the end is securely closed by a ligature and a small oblique incision made with sharp scissors as near as possible to the closed end The incision should cut a small valve with apex directed towards the closed end—the more oblique it is the better—and should at its base divide one third of the circumference of the tube (see figure, A) This incision will be found to act as a most efficient valve, opening under very slight pressure from within and preventing any regurgitation of pus or of the irrigated fluid. The tied end should be inserted to the very depth of the wound and the free end of the tube left projecting through the dressings, the number of tubes used must depend on the size and character of the wound, but it will generally be found that one, or at the most two, will suffice

A



B



In cases of a perforating wound of a limb or of a wound with two openings widely separated a very useful modification is to ligature the tube at its centre and cut a valve on each side of the ligature and pointing towards it (B) This is passed through the wound and the irrigation done from both ends In this way any fluid that is irrigated into the free ends of the tube must certainly find its way to the very bottom of the wound and from there towards the surface

To secure the tubes in position a useful plan is to make a small independent incision through the skin near the edge of the wound just large enough to grip the tube without occluding its lumen, and the free end of the tube is drawn through this after the tied end has been passed to the bottom of the wound The free ends of the tubes are left outside the dressing and the irrigating fluid passed into them by means of a glass syringe Gravity alone will generally suffice, but, if necessary, a little assistance may be given by using the plunger of the syringe If only a small quantity of fluid be used at a time the dressings on the wound need only occasional changing I have been using flavine for this purpose One to two drachms of a 1 in 1000 solution is injected through the tubes twice in 24 hours, and the results in some very septic cases have been most satisfactory

A question on which I have not yet been able to satisfy myself completely is whether wounds treated in this way should be drained. If free drainage is provided, the antiseptic fluid very readily finds its way to the surface and is absorbed by the dressings, and so is not able to remain in contact with the real surface of the wound I have sometimes thought that the best results have come about when the drainage is not free The walls of the wound then remain open and the mixture of pus and antiseptic fluid is brought into contact with the suppurating surface at all points

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL

MEMBRANOUS CONJUNCTIVITIS FOLLOWING A SQUINT OPERATION

BY S JOHNSON TAYLOR, M B EDIN

RECENTLY I performed an advancement cum tenotomy operation for a convergent squint, in a girl aged 11 years, followed by a complication which I believe to be very rare. I used three stitches for the advancement and one for the tenotomy part, which I did, as usual, by the open method All went well Two days later the upper eyelid was a little more swollen and glazed than is usual and the advancement-wound region did not look quite nice, this was soon succeeded by a definite dirty membranous area which I diagnosed clinically as diphtheritic, the tenotomy wound area quite escaping I at once had antitoxin injected hypodermically and used quinine lotion freely and frequently, as advised by Sir John Tweedy in "Diphtheritic Conjunctivitis," and slowly the condition cleared up, the stitches became very loose and either were cut out or came away The sloughy membranous patch involving the tendon and distal end of the external rectus was loth to disappear and did so very gradually, leaving a swollen granulation patch and a convergent squint as marked as before the operation. The general systemic disturbance was very slight. No bacteriological examination was made or was necessary, the clinical condition being quite sufficient to label the disease The patient had diphtheria last Christmas and two other of the children had it, and the baby with cleft palate has been for some weeks—before the operation—and still is in our isolation hospital as a carrier of the complaint.

The ground behind the patient's house is soaked with sewage, there being no drainage system there I have mentioned this case to several of my London colleagues, but can find no parallel thereto The one attack of general diphtheria did not confer any immunity against the local affection I venture to state that this complication of a squint operation is excessively rare if not unique

Norwich

THE CLINICAL MANIFESTATIONS OF A DOUBTFUL CASE

BY M J PETTY, M B CAMB, F R C S ENG

THE following case is recorded as a problem in diagnosis

Patient, girl, 6 years of age No evidence of other cases in family Mother and father both healthy When patient was 2 years of age a slight fit, with loss of consciousness, occurred, apparently complete recovery Four months later the child began to drag right foot along the ground, since then progressively getting worse till whole of right side of body was noticed to be affected Occasional vomiting occurred Bowels always regular A week ago she had another fit, leaving an apparent palsy of all the eye muscles Vomiting took place occasionally I was called in to see the child, as it was supposed that symptoms, &c, were due to a tumour near the quadrigeminal bodies

State—The child in poor general condition, lying in bed on right side, and complaining of localised pain over left occipital region which had been present for four days Mental condition quite clear but speaks in a monotone and answers quickly and rationally The right hand is held in left hand, and moved about by latter Head measurement 50½ cm regular in shape Examination of cranial nerves 1 Smell sense delicate—not the slightest impairment 2 No change in optic nerves and fundi, fields of vision normal Vision normal 3, 4, 6 Right side Pupil dilated and movements in all directions impaired, moves more than left Slight exophthalmos Left side Eye apparently immovable, but on persuasion child moved eye slightly in all directions Reaction to light good, reaction to accommodation could not be determined 5 No loss of sensation 7 Supranuclear lesion on right side, left side apparently normal 8 Hearing normal on both sides 9 Taste normal 11 Unaffected 12 Deviation to right side when tongue is protruded

Right arm Kept flexed over chest Some active flexion and extension of elbow and distal joints Grasps hand well but weakly Tendon reflexes absent No loss of sensation Arm forearm, and hand muscles definitely atrophied Left arm Loss of tendon reflexes, but otherwise normal in all its movements, not showing an intention tremor Trunk Normal sensation Abdominal reflexes right side are absent, but are brisk on left side Sphincters normal Right lower limb Definite paresis compared with left Knee-jerk absent, other tendon jerks also absent No ankle clonus Hallux erectus present Definite disuse atrophy present, limb is 2 5 cm shorter than its fellow No loss of sensation Left lower limb Stronger than right Movements well coördinated Knee jerk and other tendon jerks absent Ankle clonus absent Babinski s sign Extensor response No scoliosis Definite contracture of post-vertebral muscles in occipital region Wassermann reaction negative (two occasions) Cerebro-spinal fluid not examined Urine normal T about 99°F at night P 120 Heart, lungs and abdominal viscera normal

Fits, intense headache, occasional vomiting, and the eye symptoms suggested intracranial pressure, but of this there was no evidence on further investigation Friedreich's disease, with which much of the condition agrees, is excluded by the absence of definite ataxia and of hereditary transmission

Buenos Aires

PETROLEUM IN THE TREATMENT OF PYORRHŒA ALVEOLARIS

BY H J CORIN, L.D S

THE treatment of pyorrhœa alveolaris should be undertaken by the dentist *only* in conjunction with the patient s medical adviser, since pyorrhœa is now commonly acknowledged to be aggravated by, if not actually due to causes other than dental It is for instance, in many cases primarily induced by the absorption of toxins from a septic small intestine, a condition which obviously needs skilled medical attention

For such a condition purified petroleum is used widely and successfully, both in those cases where surgical interference is necessary, and also in those more common instances where no operation is required Most probably the therapeutic action of petroleum is known to the vast majority of medical men, but I would like to emphasise the caution given some time ago in this journal after various investigations,[1] that only the purest oil should be administered

In a case where there was only a slight discharge of pus from the gums one course of local treatment, the use of an effective mouth wash and the patient ordered to take petroleum emulsion produced a complete cure The patient was unable to come to town for six weeks after treatment but seen at the end of this period there was absolutely no trace of discharge

For long standing cases where there is a large discharge I have found petroleum with guaiacol to give wonderful results in clearing up the conditions quickly and when there is acute gingivitis petroleum with salol is useful After my experience I can confidently recommend this method of treatment as effective in many instances where other methods have failed

Old Burlington street W

Reviews and Notices of Books.

Organic to Human Psychological and Social By HENRY MAUDSLEY M.D Lond London Macmillan and Co, Limited. 1916 Pp 386 Price 12s net

THIS latest work by Dr Maudsley is fully worthy of the high reputation that has for long placed him in the front rank of contemporary scientific thinkers and writers on mental processes in health and disease His first book, the "Physiology and Pathology of Mind," published hard on half a century ago, showed his mastery of all then available knowledge of the structure and functions of the human nervous system, no less than his signal capacity for thinking scientifically It contained, moreover, the germs of much that its author has since from time to time given to us in his well known works expanded and illustrated by further experience and mature reflection Even as Dr Maudsley's earliest work drew the attention of philosophical thinkers more than that of practising medical men, so probably will this latest book appeal mainly to the scientific student of psychology and sociology whether without or within the ranks of the medical profession It must, indeed, be considered chiefly as an important contribution to the still vexed controversy between the warring schools of "materialists" or "mechanists" on the one hand, and of "vitalists" or "spiritualists" on the other Justly pre-eminent though Dr Maudsley is as an authority on the subject of insanity, and much as his other work owes to his practical knowledge and experience in this special study, his most enduring title to fame will be that of the scientific philosopher who in his day and generation consistently and persistently upheld the principle of the unity of the human organism and its continuity with the rest of Nature's processes

A true psychology ' (says Dr Maudsley in the first chapter of the book before us) must be founded *on* a clear and distinct recognition of the essential continuity and constant flux of things in which all so-called causes are effects and all so-called effects causes mind be conceived in thought as a part of the nature which its organisation is in fact Continuity of motion without end, the perpetual flux which such old Greek philosophers as Democritus, Heraclitus, and Epicurus insisted on, and Lucretius poetically expounded that is the fundamental fact *the* world never the same for an instant nor two minds ever the same nor any mind ever the same for a single hour

Again —

"Into the composition of every idea, of every mood, of every act of every reflection, every organ and every gland of the body has entered essentially, the minutely different structures and physico-chemical changes and exchanges of the parts in different persons producing different temperaments, and the signally special organs of male and *female* bodies different mental qualities requiring their special direction of development and function To deride the notion of mechanism as anywise applicable to life and life in mind is the natural error of him who, ignorant of the exquisitely subtile physical and chemical precesses at work in the simplest vital substance, thinks grossly only of inert matter and its mechanism as exemplified in the structure of a wheel barrow or a steam engine"

One more quotation must suffice for the purpose of indicating some of the main lines of thought in this book —

"That all positive intelligence is sense-evolved, though true, is not the whole truth motor reactions contribute as essentially as sensory impressions to the construction of a mental organisation and fitly respond to them in the complex composition of ideas and judgments The old saying, *Nihil in intellectu quod non prius in sensu* might indeed be fitly supplemented by the addition of *et in motu*"

It is clearly apparent that no adequate criticism of the main arguments of this book is possible within the limits of this notice Even to attempt it would involve a useless plunge into a troubled sea of dispute. But this much may be said in some justification of the high degree of value which we attribute to it The least biassed thinker on matters psychological, who is dissatisfied with any theory concerning mental phenomena which involves the importation of a purely imagined and unverifiable agency in explanation, but still may find some difficulty in regarding such phenomena as natural products of organisation, is at least likely to discover, after carefully studying Dr Maudsley's book that part, if not all, of his difficulty is lessened or removed. The case for physiological or mechanistic, as against that of any form of vitalistic psychology barring the way to further inquiry by the assumption of some inscrutable agency outside all natural processes, has rarely, if ever, been stated so clearly

---

[1] Vide THE LANCET, Oct 2nd and 16th, 1915

It must be noted that most modern biologists will disagree with Dr Maudsley in the view which he still holds, in common with that of Spencer, that mental organisation has been evolved by the successive registration of individually acquired ideas in the hereditary constitution of the race But it is not needful to enter into the dispute about the modes of reproduction of so called "acquired" qualities in order to form a due judgment as to how far Dr Maudsley's main position depends for its validity on the views he holds on this point A careful study of this book will show that even were Dr Maudsley an opponent of the Spencerian doctrine his main conclusions would not lack due support The view that mental action is a function of the organised nervous system may be held consistently by Darwinians and Lamarckians alike

Every chapter of this book is highly interesting, instructive, and full of suggestive thought, revealing the same mental vigour that marked his first volume, the study of which was recommended by the late Walter Pater to a candidate for classical honours at Oxford as a help to straight thinking

---

JOURNALS

Journal of Anatomy Conducted, on behalf of the Anatomical Society of Great Britain and Ireland, by Professor THOMAS H BRYCE, Professor EDWARD FAWCETT, Professor J P HILL, Professor G ELLIOT SMITH, and Professor ARTHUR KEITH Vol LI, Part III April, 1917 London Charles Griffin and Co Annual subscription, 21*s* post free —A high level is reached in the present issue of this journal, and the society is much to be congratulated upon the fact that the war time work of anatomists in Great Britain and Ireland, as echoed in its Journal, has placed recent issues increasingly ahead of those produced in the calm years before 1914 The long paper on the Development of the Hypophysis Cerebri, Pre oral Gut, and Related Structures in the Marsupialia, by Miss Katherine M Parker, has been accepted as a D Sc thesis by London University It emanates from the laboratory of Professor J P Hill, of University College, London, and makes another addition to our knowledge of the anatomy of a dying fauna, the proper understanding of which owes so much already to the same fostering care —Dr W Colin Mackenzie adds another paper to his Studies on the Peritoneum and Intestinal Tract in Monotremes and Marsupials, and apart from the record of the conditions present in these animals there are the deductions of a medical man accustomed to look for explanations of human conditions in the phases of phylogeny displayed in lowly creatures —A paper of clinical as well as anatomical interest is that of Dr J S B Stopford, which constitutes Part III of his Investigations on the Arteries of the Pons and Medulla Oblongata This is a sound anatomical contribution to practical medicine and surgery, and we should like to see all three parts published as an entity for the use alike of anatomists and clinicians —In the same category falls the contribution of Captain J L Aymard, R A M C, upon Some New Points on the Anatomy of the Nasal Septum and their Surgical Significance for this, too, is a paper which applies the findings of pure anatomy to direct surgical utility Dr Una Griffin at the Cambridge Hospital, Aldershot, cut and fixed for Captain Aymard some sections of the septum of the sheep, in one of which the complete circulatory system of cartilage is exemplified, the specimen showing distinct canals leading to the centre of the cartilage —Dr S Rutherford Macphail adds a short but useful note on the length of the vermiform process in 220 consecutive post mortem examinations He finds that the average length is 99 2 mm (3 97 inches), and that in the male the process is slightly longer than in the female —Professor M Amin Abdel Rahman, of Cairo, gives an account of a case of complete transposition of the viscera in an aged Egyptian male subject —The Proceedings of the Anatomical Society are appended to this issue, and apart from their value as a record of the work of the society they contain a résumé of Professor E Fawcett's communications on the developing chondrocranium. This résumé, brief though it is, constitutes the best published account of the stages of early skull formation available to students at the present time

# Reports and Analytical Records
FROM
THE LANCET LABORATORY

INTRAMUSCULAR GALYL

(THE ANGLO FRENCH DRUG COMPANY, LIMITED, GAMAGE BUILDING, HOLBORN, LONDON, E C)

HITHERTO galyl for intramuscular injection has been given with an oily excipient which had certain well known disadvantages, the absorption was relatively slow, the application was inconvenient, and frequently gave rise to pain Galyl is now prepared for intramuscular injection in the form of a sodium salt in a weak solution of glucose and is identical with the intravenous preparation as to effect and dosage The preparation is a brown fluid contained in ampoules of 15 cubic centimetres capacity We note that there is some separation of oily globules in these tubes As is well known, this organic phosphoric arsenic compound has been used in the abortive and therapeutic treatment of syphilis, recurrent typhus, and sleeping sickness Clinical reports of the cases have appeared from time to time in our columns

INSECTICIDES

(LAWSON AND CO, LIMITED, ST PHILIPS, BRISTOL.)

Considerable attention has been given of late to effective and convenient insecticides and particularly to muscicides and the preparations under notice, all of which are of an oily character, have given good results on practical trial Lawson's fly spray has the fluorescent appearance of heavy petroleum and is a perfectly clear reddish brown oil with agreeable smell. It contains a well known essential oil is pleasant and cleanly in use, and sprays effectively in a good atomiser It is an excellent application for refuse heaps and destroys larvæ The wood oil emulsion is a dark brown fluid, not soluble in, but mixing with, water on vigorous shaking It has the agreeable smell of wood creasote and is adapted for domestic purposes where a heavy oily preparation is not suitable "Carbo fly' is a dark brown mobile fluid with an empyreumatic odour resembling wood tar or turpentine It is neutral to test-paper and is a much thinner fluid than the other preparations, -and is therefore easily diffused Added to the list is an oil known as "para quit," which has been used in pediculosis It has a strong blue fluorescence resembling heavy petroleum and possesses an aromatic odour of wood tar It is stated to have been used with success as the basis of an ointment supplied to the troops in the field

TEEKOE

(J LYONS AND CO, LTD, CADBY HALL, KENSINGTON, W)

Teekoe is suggested as a substitute for tea, coffee, and cocoa, and as it is much cheaper than these commodities the suggestion is worth some attention Made in the same way as tea it yields a clear brown liquor which has a slight but attractive bitter taste resembling that of the cocoa nib It is important to note that this infusion contains an appreciable amount of theobromine, which, as is well known, is closely allied to caffeine, the alkaloid of tea to which the refreshing and stimulating properties of tea are largely attributed We extracted from "teekoe" just 0 5 per cent of theobromine, it also contains 5·40 per cent of fat The preparation yields 27 3 per cent of soluble matters to cold water It is practically free from tannin, the popular bugbear of tea Further, it may be tolerated by those with whom the better known beverages may disagree, whether or no tannin plays a part in their trouble The basis of the preparation is, according to our examination, ground cocoa shell. We remember this being used for the production of a beverage some years ago, and now that tea and coffee are costing very much more than they did before the war those bent on economy might be induced to give this substitute a trial It certainly contains more nutritives than tea or coffee

IMPROVED IMMERSION OIL

(FLATTERS AND GARNETT, LTD, OXFORD ROAD, MANCHESTER)

This oil is introduced to replace the continental supplies of "thickened cedar-wood oil," and it answers the purpose of an immersion oil in microscopical examination admirably Its refractive index is 1 510 at 30° C, it keeps clear even in the cold, is easily removed from the slide, and does not readily dry It shows a neutral reaction when tested with litmus paper

ELECTRARGOL

Electric Colloidal Silver in Minute Ultramicroscopic Particles, the Solution being Sterile and Stable.

Electrargol offers the following advantages over the colloidal silver prepared by chemical means Extreme minuteness of the particles and a degree of activity which is always equal. Absolute purity Maximum catalytic power and activity, whether physiological or therapeutic

For hypodermic injection
Boxes of 6 tubes of 5 c c
Boxes of 3 tubes of 10 c c.
For surgical use—Bottles of 50 and 100 c c

THERAPEUTICAL INDICATIONS:

All infectious diseases and in particular **Pneumonia, Bronchopneumonia, Typhoid, Typhus, Tetanus, Measles, Variola, Septicæmia, Scarlatina, Cholera, Erysipelas, Malta Fever, Acute Meningitis, &c**

LOCAL APPLICATIONS:

Septic Infections of Wounds, Mammary Abscess, Epididymitis, Orchitis, Whitlow, Furunculosis

ENESOL

SALICYLARSINATE of MERCURY.

AN IDEAL COMPOUND for Combined ARSENO-MERCURIAL TREATMENT OF SYPHILIS.

Superior to all others on account of

1 **Its slight Toxicity,** rendering possible the administration of comparatively large doses of mercury and arsenic without setting up intolerance
2 **Injections Painless** even in full doses Never causes induration.
3 **Double specific action** (mercurial and arsenical)
4 **Pharmacology and Doses.—Tubes of 2 c.c. and 5 c.c.,** containing 3 cgr (0·46 grain) per c.c solution **Medium Dose.**—Intramuscular injections of 2 c c., corresponding to 6 cgr (0 92 grain) of **Enesol** per day Should be injected by preference in the gluteal region

Large doses or saturated solutions.—Intramuscular injections of 4 to 6 c.c corresponding to 12 to 18 cgr (1 85 to 2 77 grains) of **Enesol** every two or three days Intravenous injections of 2 c c to 10 c.c , corresponding to 6 to 30 cgr (0·92 to 4·63 grains) of **Enesol,** according to the subject, urgency, and gravity of the case every two or three days.

Sold only in Boxes of 10 tubes of 2 c.c. each and 6 tubes of 5 c.c each

The above Preparations have been authorized by the **FRENCH** Ministries for use in the
NAVAL AND MILITARY HOSPITALS
Employed by leading English and French Physicians and Surgeons.

CACODYLATE

OF SODIUM (CLIN)

(Organic Arsenic)

Emphatically recommended by Professors Gautier Renaut Letulle, &c. in the treatment of

TUBERCULOSIS (either incipient or declared),
IMPALUDISM, DIABETES,
DERMATOSES and **CANCER**

DROPS —5 drops contain ¼ grain of Pure Cacodylate of Sodium.

GLOBULES —This special form consists of little Globules easy to swallow with a shell of gluten. Each Globule contains ¼ grain of Pure Cacodylate of Sodium.

TUBES (Sterilized for Hypodermic Injection) —Each Tube contains a sterilised solution dosed at ¾ grain of Pure Cacodylate of Sodium per injection of 16 minims.

NOURRY'S WINE

(Iodinated)

0·77 gr of Iodine and 1 54 gr of Tannin per tablespoonful

THIS THOROUGHLY RELIABLE and uniform preparation is prescribed by the most eminent British and Continental Physicians in cases of

LYMPHÆMIA, ANÆMIA, DYSMENORRHŒA, PULMONARY AFFECTIONS

Children—One to two teaspoonfuls Adults—One tablespoonful. To be taken at meals twice a day

Free from Alkaline Iodides. Palatable. Easily assimilated. A perfect substitute for Cod Liver Oil and Iodides.

For Reports see "BRITISH MEDICAL JOURNAL," January 12th 1895 August 29th, 1896 "LANCET" January 6th 1894 March 30th, 1901 and various other medical publications.

NOURRY'S WINE is NOT advertised to the public.

GOLD MEDAL, INTERNATIONAL CONGRESS OF MEDICINE, LONDON, 1913

Full literature sent post free on application to the Sole Agent—

F. H. MERTENS, 64, Holborn Viaduct, London, E.C. 1.

CLIN LABORATORIES — PARIS.

CYTO-SERUM

INTENSIVE STRYCHNO-ARSENICAL MEDICATION.

(HYPODERMIC INJECTION)

PAINLESS
TONIC
RECONSTRUCTIVE

FORMULA

Cacodylates—alkaline—anhydrous	30 cg
Strychnine Sulphate	1 mg
Special Isotonic Serum to 5 c c for one ampoule	

About 250,000 Injections of Cyto-Serum have been administered throughout the various countries of the world **No case of ill-results has been reported,** but the clinical effects have in general been very highly commended

INDICATIONS

Surgical Affections
War Surgery
Asthma and Emphysema
Chronic Bronchitis Catarrh
Diabetes
Diseases of Nutrition
Anæmia, Convalescences, &c.
Diseases of the Skin
Lupus, Herpes, Psoriasis, &c.
Diseases of the Blood
Chloroses, Leucocythemia, &c
Diseases of the Nervous System
Neurasthenia, Depression and General Lassitude, Chorea.
Diseases of the Digestive Tract
Anorexia, Ulcerations, Neoplasms
MALARIA & Colonial Diseases
Syphilis Tuberculosis.

SUBSTANTIAL SAMPLE ON REQUEST

RATIONAL TREATMENT OF CONSTIPATION

By the double action of secretions and peristalsis

OPOLAXYL

Opolaxyl is a combination of the secretions of the liver (biliary), pancreas, and intestines with vegetable extracts of a non diastic nature

It combines all the secretions to correspond to nature's therapy and promotes a flow of bile and glycogen with their hematopoietic and antitoxic properties

It is a normal regulator of the gastro intestinal functions, consequently it improves the metabolic exchanges of the entire organism

Opolaxyl does not lose its efficacy by prolonged use, its effect is gentle and constant, without the least irritation

It is not merely a purgative, it stimulates the defective organs and revives the normal equilibrium, it has a lasting effect by reason of it rebuilding the organs, thus correcting diminutional function

OPOLAXYL is put up in small size tabular form and should be swallowed without crunching, at bedtime or before breakfast DOSE —For obstinate constipation 2 or 3 tablets afterwards 1 tablet every 3 or 4 days for a month

The Future of Medical Education

"I TAKE it," said HUXLEY, "that the whole object of education is in the first place to train the faculties of the young in such a manner as to give their possessors the best chance of being happy and useful in their generation, and in the second place to furnish them with the most important portions of that immense capitalised experience of the human race which we call knowledge of various kinds" HUXLEY was speaking of the essentials of education without regard to specialisation. He was considering, in fact, how the young could best be trained, so that having become possessors of "most important portions of capitalised experience,' they could turn their acquisitions to a good account for the race and incidentally for themselves as citizens We published last week in the Students' Number of THE LANCET a guide to the various curriculums by compliance with which the medical student is transformed into the medical practitioner In considering these various educational schemes, which, though differing in detail somewhat, are of the same general and standardised pattern, we are led to ask how far this pattern complies with HUXLEY S requirements

The feeling among many thoughtful teachers, both those concerned only and those not concerned at all with medical education, is one of dissatisfaction with the existing scheme, even while allowing its virtues, and, in particular its possibilities A glance at what is required of the medical student to day, as set out in our Students' Number, explains that feeling, which is founded upon the knowledge that the curriculum is too crowded This is shown by the number of candidates for admission to the medical profession, who, failing in the early tests, lose their stride in the race, and take as much as 15 per cent of the years when they might be doing a man s work in obtaining the hall mark qualifying them to do that work legally In most cases of this sort the education which the student received in the ordinary manner at a secondary school proved not to be designed to assist him in his future specialised or professional education There is no common opinion among educational authorities that we have here the only, or even the greatest default in the education of the medical student, for a certain number of such authorities in pointing to the success of a few, and sometimes reminiscent of their own academic achievements would have us believe that the possession of considerable academic knowledge, classical or mathematical is the ideal introduction to medicine But those who think so now must be small in number and blind to the impossibility of working out any general plan of medical education on a foundation which takes so long to lay, which is often so untruly laid, and which is so little adapted for erection thereon of applied medical knowledge That literæ humaniores and pure mathematics form the necessary basis of both the literary and the logical sides of the study of medicine no one denies—they stand in this relation to specialised knowledge of every description, but alongside of their study, in the case of the medical student, there must be room for the pursuit of general applied science, for it is on the application of his familiarity with the main teachings of natural philosophy that comprehension of medical principles depends When the medical student has obtained an education based on the public school ideal—which does not mean the public school average performance—he finds himself devoid of acquaintance with a whole set of important subjects which he must master before he can confine his efforts profitably to medical fields He must have certain branches of general science at his finger s ends before he can realise what the science of medicine is, or what is the significance of any problem in pathology If the cult of classics and pure mathematics is allowed to comprise the medical student's education until he leaves school, so that he wants at least another year in which to grasp the principles of natural philosophy before he arrives at anatomy and physiology, which sciences in their turn are to make pathology have a real meaning for him—if all this, medical education must remain a very long business, and that is exactly what cannot be contemplated calmly at this moment, with the lessons of war staring us in the face

There can be no doubt in our mind that while between the ages of 14 and, say, 17 all education should be primarily directed to the training of faculties on some general system, at 17 those who are able to make up their mind that they intend to adopt the profession of medicine should find it possible to take advantage of a scheme of specialised training At all public schools the study of formal science ought to be made available after the age of 16 or so, in this way the able and intelligent boys who have the intention or the bent to become medical men would receive in their scientific training that sort of systematic instruction which they would be receiving if they had pursued a classical or mathematical course—that is to say, if they had followed what is really the specialised course of many schools There will always be a number of men who acquire medical knowledge after having gone very far in other directions and it is a capital thing that there should be such, for more than often, when they have covered themselves with school and university honours, they proceed to adorn our ranks particularly, but this fact ought to be regarded as the extraordinary way of achieving distinction in the profession of medicine, and not as an argument for making the careers of these exceptions the pattern for our medical students in bulk Our students must be able to start earlier on their special work, and with a more firmly laid foundation, but this is not to say that the general education of their youth is to be neglected

The training of naval cadets, which used to commence almost in the nursery, and even now deals with material selected when very young, has been taken by educational experts as a proof alike of the good and the evil that may emerge from early specialisation, but the opinion of many who have given great attention to this matter is, we believe, that the individual officers would benefit, and that the Navy would not suffer, if the time limit for entrance into the Senior Service were raised by as much as three years To us it seems that this is probably true, and that the age thus suggested—namely, 16½ to 17—is about the age when schoolmasters, parents, and boys themselves might well be asked to decide if the boys intend to become medical men And if the answer is in the affirmative these boys should have the opportunity while still at school of getting the training that they want The supply of medical men will be an urgent consideration for the General Medical Council at the termination of the war As the standardising authority over the medical education of the whole of the country the Council must, of course, do justice to those parts of the country where the facilities for scientific training are hard to come by, and this is a matter which, it will be at once admitted, bristles with difficulties But the difficulties should be attacked At the present time, a critical time in the history of national development, our medical students are not obtaining the education postulated by HUXLEY'S wisdom—ever direct and simple, their faculties are not being duly developed, and they are not furnished at a sufficiently early stage in their careers with the capitalised experience that would be most important for their future They make good, but with waste of time

◆

The Effect of the War upon Psychiatry in England

ONE of the results of war on the colossal scale of to day has been the appearance in military and civilian hospitals and analogous institutions of mental and nervous cases by, literally, thousands The welcome sequel has been a quickening of interest on the part of the medical profession as a whole in these types of case, of which in many instances the medical practitioner was little qualified either by education or by previous experience to take cognisance Not *only* has the specialist had abundant opportunities of increasing his knowledge, theoretical and practical, it has been gratifying to take note of the large number of useful contributions published in one journal or another by observers who would not describe themselves as expert neurologists or psychiatrists Indeed, it is this latter fact that is significant, for it may mark the beginning of a general movement for the abolition of a long standing reproach The medical profession, including many of its younger members, has been brought into contact with phases of mental and nervous disturbance to a degree hitherto impossible, has realised its lack of learning, its unfamiliarity with the subject, due in part at least to seriously inadequate teaching, and as a result has determined to acquire information while the occasion continues An outcome of this revived interest is undoubtedly the expression of dissatisfaction with the existing methods of handling such cases in civilian life We do not misrepresent the situation when we state that the average neurologist has, as a rule, been preoccupied with organic nervous disease to the exclusion of functional disease, while the psychiatrist, attached to an institution, has had little or no chance of studying, and no incitement to study, mental disease in its early manifestations A hard and fast line cannot be drawn between the two sister branches, but an important group of borderland cases, coming, theoretically, under the purview of one or other, has been in large part, intentionally or unavoidably, ignored Not otherwise can we explain the persistence of the gross anomalies and unworthy neglect still characterising the measures in vogue for dealing with such cases In our columns[1] we have repeatedly drawn attention to the inferior position we occupy among the nations in our attitude towards psychiatry And we know well it has been a bitter experience for those who have laboured to remedy these defects that so little has been accomplished

But the war is changing things Special medical boards have been appointed to deal with neurasthenic cases, and the retention in or discharge from the army of the victims of shock and nervous disturbance Everywhere the practitioner of medicine is meeting with the "shell shocked" soldier, and though he may be conscious of his own inability to treat such a case out of a full experience, at least it is borne in on him that the patient cannot be left to his own devices The determination to deal with such cases adequately has been manifested both by the medical profession and the public, and the outcome of their awakening has been the establishment of a number of special hospitals all over the country, some of them due to private generosity, as in the case of Mr JOHN LEIGH'S recent gift of Brooklands, near Manchester These are doing excellent work and achieving praiseworthy results, but the problems of "shell shock" are neither new nor mysterious, they are the everyday problems of the "nervous breakdown." The admission of the necessity of places for the suitable reception of such cases when occurring in the Navy or Army, and their prompt organisation, have painfully emphasised the insufficiency of our present methods for dealing with such cases in civil life and the unjustifiability of our neglect In this connexion we wish to draw our readers' attention to a small book, recently published, with the not sufficiently indicative title "Shell Shock and its Lessons"[2] The lessons which this book sets out to inculcate all go to prove the urgency of reforming our treatment of the mentally afflicted For the authors find that exactly here mediæval traditions are still encumbering English psychiatry; indifference, inertia, and lack of knowledge are still all too apparent, obstacles are still being raised through our national obstinacy and our devotion to such catch phrases as the "liberty of the subject" It is an ironical comment on the situation that the little volume is written by a professor of anatomy, in collaboration with a reader in psychology who is not a member of the medical profession

---

[1] THE LANCET April 6th 1912 Nov 8th 1913 and June 6th and Nov 7th 1914

[2] Shell Shock and its Lessons By Professor G Elliot Smith and T H Pear Longmans, Green and Co 1917 2s 6d. net.

In language that is no whit too strong they pillory the British attitude towards the treatment of mental disorder and show that the blend of apathy and ignorance with which our country has too long regarded these problems is rapidly becoming our exclusive distinction But the war has compelled us to deal in a modern, scientific fashion with borderland cases and early mental cases among sailors and soldiers, and if our medical profession handle such cases in numbers and restore them to normal life with conspicuous success, we cannot believe that measures of this kind will be restricted in future to the Services and will hold good only "for the duration of the war" On the contrary, we are convinced that the widespread interest which part at least of the medical profession is evincing in nervous and mental disease will render any reactionary steps impossible, reconsideration of our methods of teaching and demonstrating in these subjects will follow

The Economical Use of Medical Officers in the Army

A COMMITTEE has been appointed by the Secretary of State for War to proceed to France to inquire into the administration of the Army Medical Service The committee is composed as follows —

Major General Sir FRANCIS HOWARD (chairman),
Sir RICKMAN GODLEE,
Sir FREDERICK TAYLOR,
Sir W WATSON CHEYNE, M P,
Lieutenant Colonel H J STILES,
Dr NORMAN WALKER,
Dr CHARLES BUTTAR, and
Dr J B CHRISTOPHERSON (secretary)

The committee was appointed mainly at the instance of the Central Medical War Committee, and fittingly includes in it Dr BUTTAR, the chairman of the Executive Subcommittee of that Committee, three prominent representatives of the Committee of Reference of the English Royal Colleges, and the convener of the Scottish Medical Service Emergency Committee Its personnel is strengthened by the inclusion of Lieutenant Colonel STILES, and the secretary, Dr CHRISTOPHERSON, whose professional qualifications cover between them a very large field We are glad to learn that the investigations of the committee will be extended to the United Kingdom, for it is in the personnel of the medical officers of the Army at home that most of the debates on the economical distribution of medical service have had their origin It is here that the particular knowledge of the Medical War Committees will have full play, and there is a good case for making the representation of the Central Committee a larger one

Annotations.

"Ne quid nimis."

THE ORDER OF THE BRITISH EMPIRE

AMONG the 268 appointments to the new Order conferred on "persons, male or female, as may have rendered or shall hereafter render important services" to the British Empire appear the names of five medical women and eight medical men We give the complete list of these on p 360 Lieutenant Colonel Edward Stewart, who becomes a Knight Commander of the Order, is medical assessor to the Red Cross in France The services of the five women who become Commanders have been varied and conspicuous Dr L Garrett Anderson is well known as the organiser of a complete hospital unit in France, and Dr Flora Murray as officer in charge of this unit after its return to this country and settlement at Endell street Lady Barrett and Dr Mary Scharlieb have been active in socio medical work of many kinds Mrs Chalmers Watson is chief controller of the Women's Army Auxiliary Corps, which undertakes important replacement duties at home and abroad But over and above these well merited honours for the holders of medical qualifications we are glad to see in the composition of the Order welcome signs of the increasing recognition of many important healing agencies The matrons of four of the metropolitan hospitals—Miss M Hogg, of Guy's, Miss E C E Luckes, of the London, Miss A McIntosh, of St Bartholomew's, Miss A L Still, of St Thomas's—along with Sister Pauline, of the Italian Hospital, are admitted to the Third Class, where the name also appears of Miss Margaret MacMillan, justly famous in connexion with open air day nurseries Mrs Mabel Dease, with other officers of the Welfare Department at the Ministry of Munitions, becomes an Officer of the Order in recognition of work as important in its wideness of range as that of Mr R J Parr, director of the National Society for the Prevention of Cruelty to Children Among the higher distinctions we are glad to see the names of Lord Sydenham, the efficient president of the National Council for Combating Venereal Diseases, and Sir Arthur Pearson (Knights Grand Cross), along with those of Mr Cyril Jackson and Mr A R Yapp (Knights Commanders), whose work in connexion with the Pensions Statutory Committee and the Y M.C.A huts respectively has had beneficent results on an incredibly large scale In the person of Dame Katherine Furze, as commandant-in chief of the Women's Voluntary Aid Detachment, that agency receives the highest official honour, which is not more than its due The names of some well known chemists also figure in the list Professor Herbert S Jackson is chemical adviser to the Optical Research Branch of the Ministry of Munitions, and the honour conferred upon him is a recognition of his admirable work in the making of optical glass Professor H. Brereton Baker a member of the Trench Advisory Committee, is known in connexion with the prevention and alleviation of irritant gas poisoning The work of Professor W H Bragg, who is attached to the Board of Invention and Research at the Admiralty, on the structure of crystals as revealed by X ray examination and on radio activity has brought much of promise for the future The first named becomes a Knight Commander, the two latter Commanders of the Order

BUBONIC PLAGUE

SHIP BORNE plague not infrequently makes its appearance at British ports during the months of August and September Last year the disease manifested itself at three seaport towns—namely, Bristol, Hull, and Liverpool—but fortunately, thanks to the energetic preventive measures taken by the port sanitary authorities, there was no spread of the malady[1] This year there have already been two instances of the arrival of steamers at our ports with cases of plague on board, which may be briefly summarised thus

The first of these was in May, when the ss *Sardinia* called at Falmouth and reported that her captain was sick The ship was from Australia, but had called at Bombay, where she loaded a cargo of grain, and also at Marseilles, where part of her cargo was discharged On inquiry being made it was found that the captain's illness was of a *non infectious* nature, but that two lascar members of the crew were suffering from what was supposed to be mumps The ship sailed for the Thames, and the two suspected cases of mumps having died almost immediately, were forthwith buried at sea On arrival at Gravesend three cases of plague were discovered on the *Sardinia*, one of which proved rapidly fatal, whilst the remaining two were promptly removed to the port hospital at Denton Some days later two of the contacts developed the disease and both died They had occupied bunks adjacent to that of one of the previous fatal cases In the light of subsequent events, there does not appear to be any doubt that the patients who had been supposed to be suffering from mumps were really cases of plague, and, on this assumption, there was a total of seven plague cases, of which five had a fatal termination

The second instance of the arrival of ship borne plague during the course of the present year occurred on August 13th, when the ss *Matiana* from Bombay arrived at Gravesend The vessel had called at Falmouth on August 11th, but no cargo was discharged and no passengers were landed at that port Prior to the arrival of the ship, between July 14th and 28th, nine cases of bubonic plague, with six deaths, took place among the crew, the bodies being buried at sea Three convalescents were taken off the ship at Gravesend and removed to the port hospital, while the remaining members of the crew were kept under medical observation Another case occurred among these contacts which resulted in the death of the patient There were in all 10 cases and 7 deaths The ship was detained at the official mooring station off Gravesend, and the cargo was discharged into lighters under the supervision of the medical officer of health of the Port of London Sanitary Authority

We understand that in the case of each of the above mentioned vessels partial disinfection of the holds had been carried out at a port of call before their arrival at an English port and before their cargoes had been discharged There is a suggestion from these facts that the fumigation of the vessels at an intermediate port may have had the effect of driving infected rats from the holds into the living quarters of the crew, and this would account for the late development of plague on board these ships some weeks after leaving Bombay We understand that these occurrences are being officially investigated, and no doubt the details will in due course be published The occurrence of plague cases on board ship need not give rise to apprehension so long as the sanitary administration of the port at which the ship arrives is efficient in character and all the proper preventive measures are rigorously carried out Such measures, of course, include prompt removal of the patients to hospital, the keeping of all contacts under medical observation for some days, the employment of means to prevent access of rats from the ship to the shore during discharge of the cargo, thorough disinfection along with destruction of rats on board the vessel after discharge of the cargo, and systematic rat destruction on the docks, wharves, and warehouses so as t minimise the danger of spread of the diseas among these rodents should an infected rat escap from the ship to the shore A sanitary survey o the ports of England and Wales is at present bein carried out by the medical inspectors of the Loc Government Board, the necessity for such actio being well illustrated by the occurrences to whic we have referred

INFANT MORTALITY IN AUSTRALIA

THE report on infant mortality which has jus been issued by the Commonwealth Committee o Death and Invalidity (C 3499, Government printe Melbourne) is a document of the greatest interes inasmuch as it records the experience of our ow kith and kin under conditions less fixed by habi and custom, and a careful study of the result cannot fail to shed some light on the solution o the same problem in this country The repor starts off with a comparison of the infant mortalit rate in various countries, using as a basis the mos recent available five years' average Russia and Hungary head the list with 254 and 204, New Zealand is the lowest with 59, while the Commonwealth figure of 72 is bettered only by Norway with 70 When the Commonwealth figures are further analysed into their constituent parts, Queensland and South Australia, with 67 and 65, both excel any European country While the rate has dropped steadily in New Zealand during the 45 years of observation, it is only since 1903 that there has been any marked decline in the Commonwealth rate, except in South Australia, where the diminution—starting from the very high figure of 158—has been nearly continuous The fall has taken place chiefly in the urban areas, the reduction being similar in kind in the rural districts, but less than one half the extent, the committee concluding that the same factors are operative in each but to a differing degree It is very striking that the reduction has scarcely affected the rate for infants under one month old, which remains practically what it was, and always higher for boys than for girls In New South Wales, indeed, the first week of post-natal life has increased recently in risk The committee naturally attribute this early mortality of the new born child to the working out of ante natal causes, and devote a deeply interesting section of the report to a discussion of these causes They agree in the main with the conclusions of Dr Whitridge Williams, of Baltimore, who found syphilis, "unknown causes," difficult labour, prematurity, and toxæmias to account for 75 per cent of the early deaths, syphilis being certainly responsible for 25 per cent and probably for many more The problem of controlling ante natal causes of infantile mortality resolves itself, therefore, the report states, into (1) the control of syphilis, (2) the reduction of known causes, such as poverty and overstrain of the mother, difficult labour, toxæmias of pregnancy, and (3) further study of the large group of "unknown causes" The committee quote with approval the suggestion of Dr W Bruce, medical officer for Ross and Cromarty, who has proposed the confidential notification, within 24 hours, of the causes of death to the medical officer of health, in order to enable him to take any action necessary to add to scientific knowledge They urge on the Australian Government the desirability of applying on a large scale in a selected area an experimental scheme for reducing the infant mortality on the lines of that framed and enforced by the municipality of Villiers le Duc,[1] which has, so the report states, simply abolished the death-rate of infants Of the environmental causes of mortality operating most potently in the second and third months, pneumonia and the diarrhœa groups are dominant in Australia, while after the third month in order of frequency, pneumonia, bronchitis, diarhœa, enteritis, whooping cough, tuberculosis, and meningitis claim 75 per cent of the total deaths It is these environmental causes which have been reduced so largely during the last 15 years Australia may rest assured that we shall watch with interest the result of her efforts in the solution of the problem

A NEW TREATMENT OF AMERICAN LEISHMANIASIS

Dr Edmundo Escomel, of Arequipa, Peru, has published a pamphlet from Buenos Aires detailing the promising results which he has obtained in the treatment of cases of American leishmaniasis with a solution of oxide of antimony in water and glycerine as prepared by Mr W Martindale, of London Dr Escomel notes that this solution keeps better than tartar emetic solution, that it can be administered subcutaneously, intramuscularly, or intravenously, and that no untoward general or local irritating reaction or complication was observed to follow its injection by any of these methods The record of the history and treatment of one of his successful cases is accompanied by photographs showing the appearance of the facial lesions before and after the course of treatment In this case there was extensive ulceration of the patient s foot, six months after the onset of the disease, when treatment was begun, the secondary lesions (which had started from the skin near the lips and contour of the nose) had invaded the whole nasal mucous membrane and the back of the palate The treatment was as follows —

On Sept 10th, 1916, a subcutaneous injection of 1 c c of the oxide of antimony solution On the 12th, 16th, 18th, 21st, and 24th intramuscular injections of 1 c.c of the same solution On the 26th 28th, 30th, and Oct 3rd intravenous injections of 1 5 c.c of the same solution On the 5th a subcutaneous injection of 1 5 c c of the same solution and a local application of tartar emetic powder to the nasal mucous membrane previously anæsthetised From this date until Dec 5th a repetition of the treatment as recorded above On the 6th an intravenous injection of 1 c c. of the oxide of antimony solution and on the 7th an intravenous injection of 2 c c , together with a second local application of tartar emetic powder to the nasal mucous membrane On the 9th an intravenous injection of 2 c c of the oxide of antimony solution, and from this date until Dec 24th intravenous injections of 1 c c In addition on the 23rd and Jan 2nd the patient was given massive injections of 6 c c of the oxide of antimony solution without any untoward local or general reaction being produced. Cicatrisation of the facial cutaneous lesions commenced on Dec. 6th, and by Jan 2nd the cure of these lesions was complete but the injections were continued throughout January and February to complete the cicatrisation of the mucous membrane The extensive ulceration of the foot healed completely without special local treatment

As a control to this case Dr Escomel describes and illustrates with photographs a case of facial blastomycosis in which the same treatment, carried on at the same time, failed to effect any improvement in the patient s condition, which became steadily worse as the disease continued its invading progress Dr Escomel sums up his conclusions as follows (*a*) The solution of oxide of antimony in water and glycerine has cured the cases of American leishmaniasis in which it has been used, (*b*) it does not produce the general effects nor the local irritant effect of tartar emetic, (*c*) it keeps well for a long time, (*d*) for these reasons it appears to be indicated as a substitute for tartar emetic in the treatment of American leishmaniasis, (*e*) up to the present it has not cured cases of blastomycosis, (*f*) in mixed cases of leishmaniasis and blastomycosis—which are rather frequent—the therapeutic effect is observed on the leishmania affection only, and, after an apparent improvement, the disease continues its slowly invading progress as a result of the blastomycosis, which alone remains

SELF-INFLICTED INJURIES AMONG SOLDIERS

Professor Attilio Ascarelli, of the Headquarters Military Hospital, at Rome, has published[1] some interesting observations based on his personal examination of several hundred cases during the last two years among soldiers suspected of suffering from medical or surgical ailments voluntarily inflicted or simulated The study of the exceptional causes which lead soldiers into this special kind of crime shows them to be many and various At the front there are met with especially forms of minor injuries sufficient to cause withdrawal from the fighting line to a base hospital, and each form of injury may assume an epidemic, almost contagious, aspect, so that one special lesion becomes predominant in a certain section of the troops, at first by the occurrence of a few cases which are often passed unrecognised, then by the rapid multiplication of similar cases and their abrupt cessation when the similarity and abundance of examples render the fraud manifest Cases in the interior, on the other hand, are endemic rather than epidemic, are more numerous in one place or another, assuming sometimes one form, sometimes another The contributing factors in these cases are complex. For example, instances are of more frequent occurrence in cities than in rural districts The predominant political feeling also determines their occurrence in certain localities, while social condition seems, on the other hand, to exert but little influence Family conditions are of some importance, sometimes it is the father of a large family, sometimes a soldier who has had a brother killed in action, sometimes penurious family surroundings, induce the resort to fraud in order to avoid military service, while at other times it may be the result of nostalgia. These injuries are relatively more frequent in young adults than in those habituated to camp life, are more numerous during the days following a new levy, and are most numerous in the recruit who is overpowered by fear of the unknown, while later on he gradually adapts himself to his new life A feeling of impunity is of particular importance, the military culprit pays little heed to the condemnation awaiting him after the war, and sometimes does not hide the fact that he has been able by these means to obtain exemption for some months, so much so that relapses occur in the same hospitals where such cases are treated and some who have even been punished by the authorities return later on with the same or some other form of self inflicted injury In about one third of the cases the existence of former wounds or diseases supplies the impulse which determines the injury, a small wound completely healed constitutes an admirable substratum for the application of some caustic, a contusion or sprain suggests the production of more permanent swelling by means of tight bandaging, a conjunctivitis or otitis contracted in childhood affords an explanation and excuse for the same conditions wilfully induced A further cause is to be found in the leave granted during winter or after convalescence, the soldier who returns for a longer or shorter time to his family surroundings is tempted at the expiration of his leave, and *often under the advice* of evil companions, to resort to questionable practices The most frequent injuries met with by Professor Ascarelli were —

[1] THE LANCET, 1917, i, 653.

[1] Il Policlinico May 23rd and June 3rd, 1917 Practical Section.

(1) Inflammation and abscess due to the injection of chemical substances such as petrol benzine, turpentine, and chloride of lime generally into the calf, knee, or heel Sometimes on puncturing such abscesses an odour corresponding *to that of the substance injected* was observed (2) Abscess from injection of fæcal matter, the nature of which may sometimes be detected by the fæcal odour of the pus and the presence of a raised spot at the site of puncture (3) Chemical cauterisation, usually by soda or potash lye sulphuric or hydrochloric acid, aqua regia or chloride of zinc, the diagnosis is not difficult, but a general examination is necessary to exclude any condition that might explain the occurrence of the ulcer such as syphilis, diabetes, syringomyelia, varix, &c (4) Burns, caused by boiling water or lye, the shape and size of which often do not tally with the cause given in explanation (5) Hard œdema, a kind of cellulo dermatitis produced by self inflicted *blows frequently repeated, generally on the back* of the hand or foot, the anterior part of the thigh, or knee The region appears swollen, elevated, more or less regular in outline, and cyanotic X ray examination is always negative (6) Œdema from stasis produced by tight bandaging (7) Otitis caused by the introduction of irritants, generally grafted on a real chronic otitis The presence of lesions in the meatus and concha may reveal its artificial nature, which may result in stenosis or even facial paralysis (8) Conjunctivitis caused *by castor-oil seeds and other irritants* (9) Dermatitis from plants—i e, the roots of ranunculaceæ and euphorbia (10) Voluntary mutilation by firearms, seen almost exclusively in the war zone, in which blackening round the wound of entrance forms a guide as to the true cause

Professor Ascarelli believes that only a small minority of the soldiers who come under medical observation for self inflicted injuries exhibit definite criminaloid tendencies, but draws special attention to the marked hypoalgesia associated with such cases, which can be demonstrated by the absence of *painful impressions*, dilatation of the pupils or acceleration of pulse, when the patient is subjected to the application of strong faradism

THE UNITED STATES PHARMACOPŒIA

THE conditions under which the national pharmacopœias are revised in the United States of America and in this country differ fundamentally, but the question whether the American system is preferable to our own is hardly one that can be discussed *profitably at the present time* Another question which need only be stated just now is whether in Great Britain sufficient is done through private channels to explain lucidly to prescribers the changes that are introduced in succeeding editions of the Pharmacopœia or whether private enterprise could with advantage be supplemented, as in the United States, by official efforts The excellent publications issued in this country in the wake of a new Pharmacopœia—as, for instance, Martindale and Westcott's Extra Pharmacopœia, Squire's Companion, and the British *Pharmaceutical* Codex—would seem to provide all that could possibly be needed in the way of guides to medicines, and it is at least doubtful whether any Government department could furnish anything better In the United States, however, the Public Health Department does what in this country is done unofficially, *but the official* publication of the United States is neither so prompt, nor in our view so serviceable, as are those British publications to which reference has just been made The volume (Hygienic Laboratories, Bulletin No 107) before us consists of a digest of the changes and requirements included in the Pharmacopœia of the United States (ninth decennial revision) and in the National Formulary (fourth edition) Like the majority of official books, it looks official and lacks an *inviting appearance*, both generally and in detail That it serves its useful purpose, however, we do not doubt As the preface observes, "The publication of new editions of the established books and standards of medicines is of necessity accompanied by an element of uncertainty because of the many changes in the number and kind of *drugs and* preparations described therein, and also because of possible alterations in strength and nomenclature of widely used preparations." Hence the need on the part of the busy official, doctor, chemist, or pharmacist for something to show at a glance the present status of any official or recently official drug or compound included in the present editions of the United States Pharmacopœia and National Formulary and the immediately preceding editions The volume, in fact, is designed to serve as an index to the several recent editions of the United States official standards, and this it does effectively

THE BACTERIAL CONTENT OF A BATTLESHIP'S AIR

IN the *Archives de Médecine et de Pharmacie Navales* for April and May, 1917, Dr Candiotti, médecin de première classe (staff surgeon) of the French Navy, gives an account of his investigations, before the war, of the bacterial content of the air of a French ironclad He drew a large *volume* of air, 100 or 200 litres, through a tube of sugared water, and, plating that out, counted the colonies which developed He does not mention the culture medium nor the temperature of incubation, but he gives the number and character of aerobes and moulds found in a cubic metre of air from different parts of the ship His *experiments* were mostly made towards evening or at night, when the air was still, sometimes with the artificial ventilation stopped His numbers from the engine room and stokehold are low, those from the mess decks are higher In one of the latter he took two samples, the first about noon, which gave 1200 aerobes, 800 moulds, the second from 8 P M to midnight, when the temperature was the same, but the ventilation was obviously poor It was still weather, many hammocks were around, and a disagreeable smell prevailed This experiment gave 3600 aerobes and only 800 moulds, the same figure as by day, while the aerobe figure was trebled. In the wireless room Dr Candiotti found 3800 aerobes, 900 moulds, in the galley on the main deck 8100 aerobes, but in the vegetable store, two decks lower, 6900 aerobes and 12,800 moulds In these two latter sections only did he find colonies of the *Bacillus coli*, and he suggests that this may have accounted for the diarrhœa which he noted, *his observations being* made in summer The aerobes found were mostly staphylococci, and Dr Candiotti associates with this fact the prevalence among the men of boils and small abscesses, and the tendency of abrasions to inflame He endeavoured by guinea pig inoculation to prove the presence of the tubercle bacillus, but was unsuccessful Other observers have found smaller numbers of bacilli in the air of a *United States* battleship, but exact comparison is impossible in the absence of information regarding the culture media used and other details of method The results would gain in interest if the carbonic acid content of the air at the time of examination had been given as a guide to the efficiency of ventilation and a statement made of the number of men in the compartment and the cubic space per head

THE CASE MORTALITY OF INFECTIOUS DISEASES

THE report of the Metropolitan Asylums Board for the year 1916—the nineteenth year of issue—contains, among other statistical matter, an instructive summary of the average death rates from the common infections in the Board's hospitals during successive quinquennial periods Beginning with 1872–6, the mortality per 100 cases of scarlet fever sank period by period from 12 4 to 2 5 in 1907–11, the individual figures for the last five years being 1 6, 1 3, 1 4, 2 0, and 1 8 The similar even fall for diphtheria was from 33 6 in 1887–91 to 8 8 in 1907–11, with 6 2, 6 2, 7 9 7 9, 6 8 as the individual figures for the last five years Enteric fever started in 1872–6 with a case mortality of 18 6 which fell to 14 6 in 1907–11, and is only 13 1 in 1916 In the experience, therefore, of the Metropolitan Asylums Board scarlet fever is only one eighth as fatal as it used to be, diphtheria one fifth, and typhoid two thirds In striking contrast with these figures is the high level and relative constancy of the death rate from measles and whooping cough, 8 9 and 9 9 respectively for 1916, although it should be remembered that these have only been under observation for about ten years Scarlet fever may be said to be well under control, diphtheria is becoming so with earlier diagnosis and antitoxic treatment, but the problems of measles and whooping cough await solution

THE FACT OF DEATH

WE should have been surprised if the annotation in our issue of August 18th on death certification had not resulted in a communication from the Association for the Prevention of Premature Burial With the medical man's omission to see the corpse Mr J Brindley James associates a bevy of grisly possibilities murders may go unnoticed, insurance societies be defrauded, and unfortunate persons be buried while still alive Without necessarily sharing these gloomy forebodings we agree—and stated so in the annotation—to the desirability of a medical man seeing any person with respect to whom death has been alleged before signing a certificate The occurrence of death will not, except in the rarest instances, require verification by a medical man no attendant whether nurse or relative, at the bed side of a sick person has any doubt about the mysterious happening when the life of the person ceases to be No hospital sister sends for the resident medical officer to confirm the fact The fact of death is as clear and indisputable as the fact of life More difficulty may of course, arise where no witness was present at the time when death was assumed Our Paris Correspondent writes of tests applicable on the field of battle and of a new and safe conjunctival reaction The tests for the verification of death given by the Association may easily be further elaborated and might then become so delicate as to detect local life or the persistence of signs of life in the various tissues after general death has occurred Mr Shiro Tashiro who is instructor in physiological chemistry in the University of Chicago, has touched upon this subject in dealing with the chemical signs of life in a recent monograph published by the University of Chicago Press Mr Tashiro states that of all the signs of living processes one of the most universal is irritability, the inherent power of the living to react against a stimulation A necessary condition for this irritability of the tissues is metabolic activity, but this in itself is not evidence of vitality Metabolic response to an injury is the crucial test If a tissue is alive mechanical crushing will produce a metabolic response, if it is not alive there is no response If of two seeds or two similar pieces of animal tissue the crushed portion gives off more carbon dioxide than the other the seed or tissue is alive By means of his biometer Mr Tashiro claims to be able to make this distinction within a few minutes, or at all events within an hour or two His method is one of extreme delicacy and would have been useful in exploding the myth of millennium old living corn in mummy cases

THE DIETETICS OF SOUND WINE

SINCE the recent death of Professor Landouzy there has appeared in the *Journal de Médecine de Bordeaux* a letter from him addressed privately to a colleague who had written in the first year of the war asking advice on the attitude that should be taken by medical men to the public discussion concerning the use of wine by the troops The Academy of Medicine was then about to issue a resolution to the effect that the fighting men should receive daily a ration of wine, but high authorities and public opinion alike were disturbed by fears of alcoholism which were set forth in a number of speeches and letters, and in diligently compiled statistics Landouzy in his letter stated that he had been suspect on account of his consistent refusal to march under the banner of the abstainers "Abstention is everywhere, particularly under the sky of France,' he wrote, ' a scientific, economic, and historical heresy ' He deprecated the confusion between the ' alcoholism " of the northern countries of Europe and the metabolic effect of a quantum of French wine supplied pure and unadulterated, adding his opinion that 'natural wine ought to be given its place in the alimentary hygienic and economic ration, the ration of wine must be measured out in doses in the same way that albumin, carbohydrates, sugar, and fats are measured " To Landouzy the best way of teaching the nation to beware of alcoholism was to instruct the children in rational alimentation He thought that every Frenchman could with advantage drink daily with his meals a litre of natural wine, which at the price of 30 or 40 centimes would supply him with 500 calories daily at a price seven times less than that of the same number of calories from the butcher This would be of benefit to the Frenchman individually and to the country at large commercially, although he deprecated too close a connexion between commercialism and wine production Through industrialism the pure wine merchant was too often replaced by the "liquoriste' and the vendor of " vin maquillé " The correspondence thus started continued for some time, with the result that the Academy of Medicine passed unanimously their resolution approving of the introduction into the regulation ration of the soldier of the same quantity of natural wine as sanctioned in the Navy, with the precaution that where the authorities provided wine for the soldier he should not be able to obtain it elsewhere suggests the production of more permanent swelling by means of tight bandaging, a conjunctivitis or otitis contracted in childhood affords an explanation and excuse for the same conditions wilfully induced A further cause is to be found in the leave granted during winter or after convalescence, the soldier who returns for a longer or shorter time to his family surroundings is tempted at the expiration of his leave, and often under the advice of evil companions, to resort to questionable practices The most frequent injuries met with by Professor Ascarelli were —

(1) Inflammation and abscess due to the injection of chemical substances such as petrol benzine, turpentine, and chloride of lime generally into the calf, knee, or heel Sometimes on puncturing such abscesses an odour corresponding to that of the substance injected was observed (2) Abscess from injection of fæcal matter, the nature of which may sometimes be detected by the fæcal odour of the pus and the presence of a raised spot at the site of puncture (3) Chemical cauterisation, usually by soda or potash lye sulphuric or hydrochloric acid, aqua regia or chloride of zinc, the diagnosis is not difficult, but a general examination is necessary to exclude any condition that might explain the occurrence of the ulcer such as syphilis, diabetes, syringomyelia, varix &c (4) Burns, caused by boiling water or lye, the shape and size of which often do not tally with the cause given in explanation (5) Hard œdema a kind of cellulo-dermatitis produced by self inflicted blows frequently repeated, generally on the back of the hand or foot, the anterior part of the thigh, or knee The region appears swollen, elevated, more or less regular in outline, and cyanotic X ray examination is always negative (6) Œdema from stasis produced by tight bandaging (7) Otitis caused by the introduction of irritants, generally grafted on a real chronic otitis The presence of lesions in the meatus and concha may reveal its artificial nature, which may result in stenosis or even facial paralysis (8) Conjunctivitis caused by castor-oil seeds and other irritants (9) Dermatitis from plants—i e, the roots of ranunculaceæ and euphorbia (10) Voluntary mutilation by firearms, seen almost exclusively in the war zone, in which blackening round the wound of entrance forms a guide as to the true cause

Professor Ascarelli believes that only a small minority of the soldiers who come under medical observation for self inflicted injuries exhibit definite criminaloid tendencies, but draws special attention to the marked hypoalgesia associated with such cases, which can be demonstrated by the absence of painful impressions dilatation of the pupils or acceleration of pulse, when the patient is subjected to the application of strong faradism

THE UNITED STATES PHARMACOPŒIA

THE conditions under which the national pharmacopœias are revised in the United States of America and in this country differ fundamentally, but the question whether the American system is preferable to our own is hardly one that can be discussed profitably at the present time Another question which need only be stated just now is whether in Great Britain sufficient is done through private channels to explain lucidly to prescribers the changes that are introduced in succeeding editions of the Pharmacopœia or whether private enterprise could with advantage be supplemented, as in the United States, by official efforts The excellent publications issued in this country in the wake of a new Pharmacopœia—as, for instance, Martindale and Westcott's Extra Pharmacopœia, Squire's Companion, and the British Pharmaceutical Codex—would seem to provide all that could possibly be needed in the way of guides to medicines, and it is at least doubtful whether any Government department could furnish anything better In the United States, however, the Public Health Department does what in this country is done unofficially, but the official publication of the United States is neither so prompt, nor in our view so serviceable, as are those British publications to which reference has just been made The volume (Hygienic Laboratories, Bulletin No 107) before us consists of a digest of the changes and requirements included in the Pharmacopœia of the United States (ninth decennial revision) and in the National Formulary (fourth edition) Like the majority of official books, it looks official and lacks an inviting appearance, both generally and in detail That it serves its useful purpose, however we do not doubt As the preface observes, "The publication of new editions of the established books and standards of medicines is of necessity accompanied by an element of uncertainty because of the many changes in the number and kind of drugs and preparations described therein, and also because of possible alterations in strength and nomenclature of widely used preparations" Hence the need on the part of the busy official, doctor, chemist, or pharmacist for something to show at a glance the present status of any official or recently official drug or compound included in the present editions of the United States Pharmacopœia and National Formulary and the immediately preceding editions The volume, in fact, is designed to serve as an index to the several recent editions of the United States official standards, and this it does effectively

THE BACTERIAL CONTENT OF A BATTLESHIP'S AIR

IN the *Archives de Médecine et de Pharmacie Navales* for April and May, 1917, Dr Candiotti médecin de première classe (staff surgeon) of the French Navy, gives an account of his investigations before the war, of the bacterial content of the air of a French ironclad He drew a large volume of air, 100 or 200 litres, through a tube of sugared water, and, plating that out, counted the colonies which developed He does not mention the culture medium nor the temperature of incubation, but he gives the number and character of aerobes and moulds found in a cubic metre of air from different parts of the ship His experiments were mostly made towards evening or at night, when the air was still, sometimes with the artificial ventilation stopped His numbers from the engine room and stokehold are low, those from the mess decks are higher In one of the latter he took two samples, the first about noon, which gave 1200 aerobes, 800 moulds, the second from 8 P M to midnight, when the temperature was the same, but the ventilation was obviously poor It was still weather, many hammocks were around, and a disagreeable smell prevailed This experiment gave 3600 aerobes and only 800 moulds, the same figure as by day, while the aerobe figure was trebled In the wireless room Dr Candiotti found 3800 aerobes, but in the galley on the main deck 8100 aerobes, 900 moulds, in the vegetable store, two decks lower, 6900 aerobes and 12,800 moulds In these two latter sections only did he find colonies of the *Bacillus coli*, and he suggests that this may have accounted for the diarrhœa which he noted, his observations being made in summer The aerobes found were mostly staphylococci, and Dr Candiotti associates with this fact the prevalence among the men of boils and small abscesses, and the tendency of abrasions to inflame He endeavoured by guinea-pig inoculation to prove the presence of the tubercle bacillus, but was unsuccessful Other observers have found smaller numbers of bacilli in the air of a United States battleship, but exact comparison is impossible in the absence of information regarding the culture *media* used and other details of method The results would gain in interest if the carbonic acid content of the air at the time of examination had been given as a guide to the efficiency of ventilation and a statement made of the number of men in the compartment and the cubic space per head

THE CASE MORTALITY OF INFECTIOUS DISEASES

The report of the Metropolitan Asylums Board for the year 1916—the nineteenth year of issue—contains, among other statistical matter, an instructive summary of the average death rates from the common infections in the Board's hospitals during successive quinquennial periods Beginning with 1872–6, the mortality per 100 cases of scarlet fever sank period by period from 12 4 to 2 5 in 1907–11 the individual figures for the last five years being 1 6, 1 3, 1 4, 2 0, and 1 8 The similar even fall for diphtheria was from 33 6 in 1887–91 to 8 8 in 1907–11, with 6 2, 6 2 7 9 7 9, 6 8 as the individual figures for the last five years Enteric fever started in 1872–6 with a case mortality of 18 6 which fell to 14 6 in 1907–11, and is only 13 1 in 1916 In the experience, therefore, of the Metropolitan Asylums Board scarlet fever is only one eighth as fatal as it used to be, diphtheria one fifth, and typhoid two thirds In striking contrast with these figures is the high level and relative constancy of the death rate from measles and whooping cough, 8 9 and 9 9 respectively for 1916, although it should be remembered that these have only been under observation for about ten years Scarlet fever may be said to be well under control, diphtheria is becoming so with earlier diagnosis and antitoxic treatment, but the problems of measles and whooping cough await solution

THE FACT OF DEATH

We should have been surprised if the annotation in our issue of August 18th on death certification had not resulted in a communication from the Association for the Prevention of Premature Burial With the medical man's omission to see the corpse Mr J Brindley James associates a bevy of grisly possibilities murders may go unnoticed, insurance societies be defrauded, and unfortunate persons be buried while *still alive* Without necessarily sharing these gloomy forebodings we agree—and stated *so in the* annotation—to the desirability of a medical man seeing any person with respect to whom death has been alleged before signing a certificate The occurrence of death will not, except in the rarest instances, require verification by a medical man no attendant, whether nurse or relative at the bed side of a sick person has any doubt about the mysterious happening when the life of the person ceases to be No hospital sister sends for the resident medical officer to confirm the fact The fact of death is as clear and indisputable as the fact of life More difficulty may of course, arise where no witness was present at the time when death was assumed Our Paris Correspondent writes of tests applicable on the field of battle and of a new and safe conjunctival reaction The tests for the verification of death given by the Association may easily be further elaborated and might then become so delicate as to detect local life or the persistence of signs of life in the various tissues after general death has occurred Mr Shiro Tashiro who is instructor in physiological chemistry in the University of Chicago, has touched upon this subject in dealing with the chemical signs of life in a recent monograph published by the University of Chicago Press Mr Tashiro states that of all the signs of living processes one of the most universal is irritability, the inherent power of the living to react against a stimulation A necessary condition for this irritability of the tissues is metabolic activity, but this in itself is not evidence of vitality Metabolic response to an injury is the crucial test If a tissue is alive mechanical crushing will produce a metabolic response, if it is not alive there is no response If of two seeds or two similar pieces of animal tissue the crushed portion gives off more carbon dioxide than the other the seed or tissue is alive By means of his biometer Mr Tashiro claims to be able to make this distinction within a few minutes, or at all events within an hour or two His method is one of extreme delicacy and would have been useful in exploding the myth of millennium old living corn in mummy cases

THE DIETETICS OF SOUND WINE

Since the recent death of Professor Landouzy there has appeared in the *Journal de Médecine de Bordeaux* a letter from him addressed privately to a colleague who had written in the first year of the war asking advice on the attitude that should be taken by medical men to the public discussion concerning the use of wine by the troops The Academy of Medicine was then about to issue a resolution to the effect that the fighting men should receive daily a ration of wine, but high authorities and public opinion alike were disturbed by fears of alcoholism which were set forth in a number of speeches and letters, and in diligently compiled statistics Landouzy in his letter stated that he had been suspect on account of his consistent refusal to march under the banner of the abstainers 'Abstention is everywhere, particularly under the sky of France," he wrote, a scientific, economic, and historical heresy" He deprecated the confusion between the 'alcoholism" of the northern countries of Europe and the metabolic effect of a quantum of French wine supplied pure and unadulterated, adding his opinion that "natural wine ought to be given its place in the alimentary hygienic and economic ration, the ration of wine must be measured out in doses in the same way that albumin, carbohydrates, sugar, and fats are measured" To Landouzy the best way of teaching the nation to beware of alcoholism was to instruct the children in rational alimentation He thought that every Frenchman could with advantage drink daily with his meals a litre of natural wine, which at the price of 30 or 40 centimes would supply him with 500 calories daily at a price seven times less than that of the same number of calories from the butcher This would be of benefit to the Frenchman individually and to the country at large commercially, although he deprecated too close a connexion between commercialism and wine production Through industrialism the pure wine merchant was too often replaced by the "liquoriste" and the vendor of "vin maquillé." The correspondence thus started continued for some time, with the result that the Academy of Medicine passed unanimously their resolution approving of the introduction into the regulation ration of the soldier of the same quantity of natural wine as sanctioned in the Navy, with the precaution that where the authorities provided wine for the soldier he should not be able to obtain it elsewhere

PARIS

(FROM OUR OWN CORRESPONDENT)

Malaria in the Near East and its Treatment

THE large number of men invalided with malaria from the Salonika Army has necessitated the provision of special hospitals to group the cases and give them systematic treatment and care Most of these hospitals are situated for convenience in the Marseilles district, but others are scattered up and down the country, and in the special hospital at Rueil, near Paris, accommodation is provided for convalescent soldiers who relapse and cannot be sent back to their depôt without previous treatment The abundant clinical material has given occasion for new studies on malaria, the special forms met with at Salonika, the results of various methods of treatment One of the most complete of these studies was presented to the Academy by Principal Marchoux, who was attached before the war to the Pasteur Institute and is now in charge of the medical service of the Place de Paris As a result of numbers of blood examinations made at the Pasteur Institute he concludes that in the malaria of the Near East the three recognised forms of Laveran's hæmatozoon, may be found, *Plasmodium vivax* being often associated with *P falciparum* M Marchoux s conclusions definitely point to quinine treatment, with regard to which he makes important observations likely to modify current principles of treatment A dose of 1 gm of quinine by the mouth causes a rapid disappearance of the schizonts, and may even arrest an attack when these are nearing maturity and beginning to fragment When the schizonts are immature it is better to spread the dose over the 24 hours in four portions of 0 25 gm in order to avoid auditory disturbance Fragmentation then takes place in from 24 to 48 hours without producing an attack. The action on the gametes of *P vivax* or of *P malariæ* is definite but incomplete, and some of them continue to live The crescents appear insensitive to quinine, dividing after an average period of 14 days by parthenogenesis and serving as the starting point for a new series of schizonts and gametes Hence apparent recovery may be followed by a fresh attack in 14 days, or even as much as a month later if the parthenogenetic generation has been scanty On the other hand, if the patient is the host of several generations of parasites the attacks may be weekly or even more frequent Rational treatment aims at destroying the successive crops of schizonts until exhaustion of the gametes results The microscope reveals parasites 2–3 days before the occurrence of fever, and by destroying them as soon as they appear complete sterilisation is rendered possible For this several grammes of quinine judiciously employed should suffice M Marchoux concludes by advising the grouping of malarial cases under the same roof, protected from anopheles, where daily examination of the blood can be carried out Men found to be free from parasites are sent to work in the fields, while others receive quinine and remain at rest Meantime convalescent malarial cases in Paris are being invited to have their blood examined twice a week at the Pasteur Institute as a guide to treatment at the correct moment The usual method of giving a daily dose of quinine doubtless secures against attack, but is liable to upset the digestion and is withal very costly In practice it is sufficient to administer 3 gm of quinine a week to deal with all generations of parasites in course of evolution, two or three days being necessary for each to develop to the point at which an attack is produced The diurnal dose of 1 gm is the necessary minimum assuming proper absorption and retention in the organism for a sufficient period For this reason except in acute attacks M Marchoux rejects subcutaneous and intravenous injections, for by these routes elimination is too rapid Oral medication is preferable, employing quinine salts which dissolve slowly—e g , the sulphate and especially the basic salt, which contains 85 per cent of alkaloid

Dr Ravaut and his colleagues at Marseilles have confirmed the observation that except in acute attacks quinine is as efficacious by the mouth as injected into a vein or beneath the skin These observers combine quinine with arsenical treatment, the latter being administered in the form of arrhenal, a dose of 0 2–0 3 gm being injected on two successive days alternating with two days of treatment with 2 gm of sulphate of quinine Treatment lasts 30–45 days, repeated if necessary As a preventive measure minimal daily doses of quinine are continued M Ravaut insists on the necessity of ensuring that the drug has actually been taken Struck with the complete failure of the treatment in certain cases, he made inquiries only to find that a great number of patients were avoiding treatment by a thousand ruses, either fearing the auditory or gastric effects or in order to prolong their stay in hospital He recommends a systematic urine control by means of Tanret's iodine reagent to ascertain that absorption has actually taken place, and prescribes, in the place of pills and cachets, which can readily be retained in the mouth to be spat out later, an aqueous solution of 33 gm to the litre of which 30 gm., or two tablespoonfuls, represent 1 gm of alkaloid, the dose being mixed with wine MM Jeanselme and Dalimier have done good service in determining by exact analysis the elimination of quinine in the urine following on the various routes of administration The intravenous method results in the most rapid appearance of alkaloid in the urine and the shortest stay in the system—viz , 27 hours Intramuscular injection in an oily excipient gives the longest retention—viz , 60 hours Taken by the mouth the urinary reaction does not appear for 25 minutes, but the duration of retention is only little longer than with intravenous administration—viz , 30 hours The latter is therefore only indicated in acute cases , for all others the oral method is preferable on account of its ease and safety

An Intermediate Surgical Hospital at the Front

New sanitary dispositions have been adopted in the army of General Anthoine which is participating in the Flanders attack In order that the wounded may be more rapidly picked up and evacuated, three clearing centres have been installed near the fighting line Competent surgeons attend to control the provisional dressings and supply each patient with a ticket, according to the nature and gravity of his wound, arranging for evacuation to special surgical centres. This arrangement has worked very well in practice Further between these clearing centres and the fighting line a new installation has been provided for the transportable wounded in the form of an intermediate surgical hospital, a sort of immense central aid post with a very thorough organisation and equipment, where all the wounded requiring operation can be attended to before being sent down to the clearing centres and the evacuation hospitals. By this means the dangers of primary infection and of gas gangrene, especially to be feared in an area which is practically a lake of mud, have been reduced to a minimum

A New Ocular Sign of Death

Dr Terson has added a new test to those already known with a view to establishing the certainty of death on the battlefield All existing tests are insufficient and open to criticism, and this applies to the best of these—viz., the injection of fluorescein as devised by Icard. In certain cases the patient who is still living does not show the green colouration of the conjunctiva with the necessary distinctness. M Terson recommends the placing on the conjunctiva of a minute quantity of dionin (ethyl morphine) powder If death has already occurred it is without effect, but if the patient is still living, although *in extremis*, an immediate and intense local reaction is produced with a purplish red colouration of the ocular conjunctiva and localised chemosis, which disappears rapidly without leaving a trace or causing inconvenience

IRELAND

(FROM OUR OWN CORRESPONDENTS)

A Dublin General Hospital in France

THE second contingent of medical men for the Dublin General Hospital has arrived in France, and taken the place of the first contingent which has been serving there for the last three months The hospital thus staffed by relays of senior men, who could hardly be spared from their hospitals and classes for a longer period than three months, is a well equipped unit of 500 beds, and the staff have up to the present been kept busily engaged. Lieutenant Colonel T E Gordon, professor of surgery at Trinity College, Dublin, has taken over the command from Lieutenant-Colonel E H. Taylor The following physicians and surgeons have accompanied him on the staff Dr Alex Blayney, surgeon, Mater Hospital, Dr Denis Kennedy, surgeon, Vincent s Hospital, Dr Maurice Hayes, X rayist, Mater Hospital, Dr R J Rowlette, physician, Jervis Street Hospital, and pathologist, Steevens' and Rotunda Hospitals, Dr G Pugin Meldon, physician, Baggot Street Hospital, Dr T M Corbet

Chair of Medicine in the Royal College of Surgeons

At a special meeting of the Council of the Royal College of Surgeons in Ireland Lieutenant-Colonel William Taylor, President, in the chair, Major Francis Carmichael Purser, M D Dub, F R.C P Irel., was unanimously elected professor of the theory and practice of physic in the Schools of Surgery Major Purser, who is visiting physician to Mercer s Hospital received his commission soon after the outbreak of war, and has been working under the Royal Army Medical Corps as consulting neurologist to the Forces in Ireland He has already occupied the position of examiner in pathology to the Schools of Surgery and that of examiner in medicine to the School of Physic, Trinity College, Dublin.

Irish Nursing Board

The Irish Nursing Board, established with the approval of the Royal College of Surgeons in Ireland to standardise the education of nurses, to frame a curriculum, to supervise examinations, and to keep a register of the names of nurses who qualify, has drawn up and circulated a scheme for the consideration of the governors of training schools. At present the education of nurses is different for each training school, and the by laws have been framed in order to enable the Irish Nursing Board to take the place in this country that the College of Nursing in London aims at taking in England After July 1st, 1920, only the names of those nurses who hold the certificates of the Board, granted after examination, will be entitled to appear on the register Before admission to the examination ,the nurse will have to produce evidence of attendance in the wards of a recognised hospital during a period of three years of 45 weeks each, and at a series of lectures delivered in a recognised hospital or by authorised persons The Board solicits the coöperation of every hospital and institution interested in the welfare of nurses

August 24th

NOTES FROM INDIA

(FROM OUR OWN CORRESPONDENTS)

Pilgrims and Disease

IN his annual report the Sanitary Commissioner with the Government of India calls attention to the part played by large fairs in the spread of disease special reference being made to the heavy mortality from cholera 90 508 deaths were attributed to cholera in the United Provinces in 1915 a mortality nearly three times as great as in the previous year, and the pilgrims returning from the fair at Hardwar are regarded as important agents in the spread of infection In the Punjab cholera was *more* prevalent than in any year since 1903 causing 13 196 deaths, the same fair being assigned a large part in the spread of the disease The Bombay Pilgrim Committee, appointed at the suggestion of the Government of India to inquire into the possibility of improving the sanitary arrangements at places in the Bombay Presidency where pilgrims congregate, reports that the chief diseases disseminated by pilgrims are tuberculosis, malaria small pox, plague and the cholera group The committee unanimously concludes that the effect of pilgrim centres on the health of the general public is very marked and that the sanitary administration of these centres should guard against the danger and be judged by the measure of success attained in averting its results

New Concessions to the Medical Services

Temporary commissions —The Secretary of State for India has recently sanctioned the following improved terms for medical practitioners possessing qualifications registrable in the United Kingdom who accept temporary commissions in the Indian Medical Service The candidates are to be permitted to engage either for general service in India or abroad or for service in India (including Burma) but not Aden In the first case the terms will be (1) While serving in India, the pay of a permanent lieutenant, Indian Medical Service—namely, Rs 420 per mensem, or if in officiating charge of a regiment Rs 450 per mensem, (2) on field service or out of India, £1 4s per diem with free quarters, if available, and rations or compensation in lieu, (3) wound pensions and gratuities and family pensions and gratuities, (4) outfit allowance of Rs 600 if all spent in India, (5) gratuity of £60 on completion of each term of 12 months or portion thereof, except when services are dispensed with The terms for the second category of officers will be (1) Pay Rs 350, with charger allowances as laid down in Army Regulations, India, (2) free rations or compensation when serving in the field, (3) wound pensions and gratuities and family pensions and gratuities, (4) outfit allowance of Rs 300

Passages to India —The Government of India have decided to grant free passage to and from India to the families of officers of the Royal Army Medical Corps, both special reserve and the holders of temporary commissions, and of officers of the Indian Medical Service engaged in England and now serving in India who renew their contracts

Infantile Mortality in Calcutta

The latest available figures show the infantile mortality in Calcutta to be about 280 per 1000 births The lady superintendent of the Dufferin Hospital has undertaken to endeavour to form an infants' clinic which, if it prove successful is likely to lead to similar undertakings on a large scale The whole question of excessive infant, and especially female, mortality in India is one which should engage the energies of the educated classes

The Amendment of the Bombay Medical Act

The Bombay Medical Union, of which Mr K. M Dubash is president and Mr R D Mody and Mr A K Contractor are joint honorary secretaries, have addressed a letter to the Secretary of Council of Bombay criticising a Bill further amending the Bombay Medical Act which is to be introduced at the next meeting of the Council by the Hon Mr V J Patel. The Bombay Medical Union object to any additions to the Act which will 'permit the association in any way of duly qualified men with quacks and their institutions as contemplated by the Hon Mr Patel's Bill" The Union state that subclauses propose to protect the class of men practising as vaids, hakims, &c, the majority of whom are illiterate and uneducated They have not studied the Ayurvedic, Unani, or other indigenous systems of medicine, such as they are, but are only practising medicine from what little knowledge they may happen to acquire as compounders, assistants to vaids and hakims, or as their menial servants Generally they study a book of recipes for different ailments and boldly prescribe for any and every disease without making any diagnosis They may be successful in some of the minor and common ailments which cure themselves or by the use of popular household remedies, but in serious cases or in those requiring knowledge and skill in diagnosis and treatment they do more harm than good Many of them prescribe European drugs and medicine without having any conception of their composition and under fictitious Indian names In short, the contention of the Union is that the old systems of medicine have been mostly forgotten and that the old names are now mere tools in the hands of the majority of vaids and hakims The Union strongly object to the inclusion of the subassistant surgeons and military assistant surgeons in the Bombay Medical Council on the ground that this Council is a judicial as well as a punitive body and that only men of good education and high professional status should be elected to a body discharging such responsible functions

A New Medical Faculty in Mysore

The special committee appointed by the Senate of the Mysore University to draft a scheme for a medical faculty reports ample facilities in Bangalore for creating such a faculty without much expense The only initial outlay will be the provision of a suitable medical college to accommodate 100 students The committee suggests a course extending to six years for the degree of M B and B S with an additional two years for M D candidates The annual expenses for the faculty are estimated at Rs 23 000 and the cost of the medical college building at Rs 2½ to Rs 3 lakhs

July 1 th

The War.

THE CASUALTY LIST

THE following names of medical officers appear among the casualties announced since our last issue —

Killed

Capt J B Rawlins, R A M C , was a student at St Mary's Hospital, London, and qualified in August, 1914 He joined up shortly afterwards and was attached to a Highland Field Ambulance

Major E F B Wilson, South African M C , qualified at Dublin in 1881, and after practising for a few years in Ireland proceeded to South Africa, where he settled at Harrismith

Lieut Col F D Blandy, R A M C , was a student at the Middlesex Hospital and qualified in 1900 Before joining up in the spring of 1915 he was in practice at Tynemouth, Northumberland and held several local appointments

Capt H D Eccles, R A.M C attached Royal Irish Rifles, was a student at Guy's Hospital, London, and qualified in 1893 Before joining up he was in practice at Kawakawa, New Zealand, where he was medical officer to the Bay of Islands Maternity and General Hospital

Died

Capt D Arthur, M C , I M S , qualified at Glasgow in 1905, and held the appointment of house physician at the Western Infirmary in that city He was afterwards assistant medical officer of health for Cheadle, and joined the Indian Medical Service in 1909 He died while a prisoner of war at Entelli, Turkey in Asia The award of the M C was recorded in THE LANCET of Oct 28th, 1916, p 770

Brigade Surgeon Lieut Col H A de Lautour, V D , received his medical education at King's College, London, and qualified in 1874 He was in practice at Wellington, New Zealand, before going on active service, and died at Invercargill

Capt H Y C Taylor, R A M C , qualified at Edinburgh in 1896, and before joining up was in practice at Bexhill-on Sea He had held appointments at the Throat Hospital, Golden-square, at the Central London Ophthalmic Hospital, and at the Children's Hospital, Great Ormond street, London , and also at the Huddersfield Infirmary

Capt A Traill, R A M C , qualified L M S S A in 1915, and joined up shortly afterwards

Wounded

Capt J C Metcalfe, M C R A M C
Capt H S Turner, M C , R A M C
Capt A J O'Brien, M C , West African Field Force
Major J P Kenny, Australian A M C
Capt J Kearney R A.M C
Lieut T C D Watt, R A M C
Capt D M Smith, R A M C
Capt C Dundee, R A M C , attached Royal Irish Rifles
Capt F Harris, M C , R A M C , attached R.F A.
Lieut J H Mayston, R A M C , attached Border Regiment
Capt R S Aspinall, R A.M C
Capt W B Loveless, R A M C , attached Royal Irish Rifles
Capt S S Meighan, R A.M C
Capt R W Kenny, M C , Canadian A M C
Capt R D MacKenzie, Canadian A M C

Missing

Capt A K Sinha, I M S
Capt E Newton, R A.M C

CASUALTIES AMONG THE SONS OF MEDICAL MEN

The following additional casualties among the sons of medical men are reported —

Private W Worthington, Royal West Kent Regiment, killed in action, only son of Dr H Worthington, of Luton, Beds

Second Lieut G F H Moore, Border Regiment, accidentally killed, only surviving son of the late Col J H Moore, R A M C , of Wellington, Somerset

Second Lieut B W Penny, Royal Fusiliers, died of wounds, youngest son of Dr E J Penny, of Wolverton, Bucks

Capt J O W Shine Royal Dublin Fusiliers, killed in action, eldest and only surviving son of Col J M F Shine, A M S

Capt J A Cahill, M C , Royal Berkshire Regiment, killed in action, only son of Dr J Cahill, of Seville street, London, S W

Second Lieut J S Reid, South Wales Borderers, died of wounds, only son of Dr E Reid, of Swansea

Lieut T H Stockwell, Canadian Infantry, killed in action, youngest son of the late Dr F Stockwell, of Bruton, Somerset

Capt H O'Connor, M C , King's Shropshire Light Infantry died of wounds, eldest son of Mr C O'Connor, F R C S.I., of Kildare

Cadet R Darling, Royal Irish Rifles, killed in action, youngest son of Dr J S Darling, of Lurgan, Ireland

Capt C Dundee, R A M C , attached Royal Irish Rifles wounded, youngest son of Dr C Dundee, J P , of Ballycarry, co Antrim

Second Lieut C W S Magill, Royal Irish Fusiliers, wounded only son of the late Dr C Magill, of Lisburn, co Antrim.

THE HONOURS LIST

The names of the following members of the medical profession are included in the first list of the recipients of the Most Excellent Order of the British Empire —

Knight Commander of the British Empire

Edward Stewart, Hon Lieut Col , R A M C

Commander of the British Empire

Louisa Garrett Anderson
Florence Elizabeth, Lady Barrett
Jay Gould, Lieut Col , I M S
Thomas Wheeler Hart
Flora Murray
Mary Ann Dacomb Scharlieb
Mary Chalmers Watson

Officer of the British Empire

Wilfred Balgarnie, Temp Lieut , R A.M C
Duncan McFayden Millar
William Ernest Nelson

Member of the British Empire

Sidney John Oldacres Dickins
George Cooper Franklin, Lieut Col , R A M C (T.F)

The following awards to medical officers are announced —

Distinguished Service Order

Major Rupert Iggulden Furber, Australian A.M C

For conspicuous gallantry and devotion to duty He had charge of an advanced dressing station for five days during which it was under heavy shell fire most of the time He displayed the greatest ability and devotion to duty in organising the dressing and evacuation of a large number of the wounded, on several occasions helping to bring them in himself

Lieut Col John Smith Purdy, Australian A M C

For conspicuous gallantry and devotion to duty Although continually under shell fire for seven days, he exercised close personal supervision over the evacuation of the wounded and by his own example of courage and disregard of danger he animated all ranks with a similar attitude of mind. His work during preliminary preparations displayed the same untiring energy and devotion to duty

Bar to the Military Cross

Temp Capt Ernest Harrison Griffin, M C , R A.M C

For conspicuous gallantry and devotion to duty He showed the greatest gallantry in rescuing wounded men by night from No Man's Land " where they had lain since dawn He worked for four hours under heavy and continued shell fire directing the bearers encouraging and personally assisting the wounded thereby enabling a large number of men to get back into our lines Whilst thus employed he went through the enemy's wire to within 60 yards of his position His work has been excellent since he came out in 1914 (The award of the M C was recorded in THE LANCET of Sept. 2nd 1916 p 460)

Military Cross

Capt Jack Rowland Stanley Grose Beard, Australian A.M C

For conspicuous gallantry and devotion to duty on many occasions He carried out his duties in attending to the wounded under the most trying and difficult circumstances under heavy enfilading artillery fire afterwards refusing to leave his aid post although it was blown in and he was buried On the following day he went out into a hostile barrage and brought in two stretcher bearers who had been wounded At all times his fearless example had the most inspiring effect on his medical staff

Capt Wendell Inglis Clark, Australian A M C

For conspicuous gallantry and devotion to duty He remained on duty for nearly three days with only four hours rest, attending to over 300 cases of wounded and working mostly under extremely heavy fire On many previous occasions he has done excellent work whilst under fire displaying the greatest courage and devotion

Capt Laurence Bedford Elwell, Australian A M C

For conspicuous gallantry and devotion to duty He persona organised, with great ability and entire disregard of his own safe the evacuation of wounded along a route which was under dir enemy observation and subjected to heavy rifle and machine-gun fi On another occasion he twice visited an aid post under inte hostile barrage to assist the officer in charge displaying as on other occasions the utmost fearlessness and devotion to duty

Capt Raphael Leo Kenihan, Australian A.M C

For conspicuous gallantry and devotion to duty He established th most forward regimental aid post in his division where he attended t the wounded under heavy shell fire the whole time Although himsel slightly wounded and compelled to shift his post twice by hostil shell fire he continued to attend all his cases with the greatest car and devotion saving many lives by remaining in his forward positio and setting a magnificent example

Temp Lieut. George Errington Lloyd R.A.M C

For conspicuous gallantry and devotion to duty He went forward to a captured position on his own initiative and established an aid post under shell fire, amongst shell-holes where he rendered valuable assistance to the wounded and was always at hand when casualties occurred

Capt Keith Shelley Parker, Australian A.M C

For conspicuous gallantry and devotion to duty He went forward under heavy artillery and machine-gun fire, and established his aid post in a shell hole, where he worked under most adverse conditions for five days without rest, attending the wounded of many units. He was under shell fire the whole time and set a splendid example of devotion to duty

Temp Capt Charles James Lodge Patch, R A.M.C

For conspicuous gallantry and devotion to duty in attending to a wounded officer in the front line and removing him to a place of safety During the whole time he was under shell fire by which he was wounded in two places, but disregarded his own wounds until those of the officer had been dressed His devotion to duty and contempt of danger when under fire have been most marked on many occasions

Temp Lieut. Frank Gordon Pedley, R.A.M.C (Lieut, Canadian A.M C)

For conspicuous gallantry and devotion to duty in proceeding to a dug out, which had been hit by enemy shell fire, and saving the lives of many of the occupants He afterwards went through a very heavy barrage to attend to a badly wounded officer whom he eventually brought back to the dressing station. On both occasions he displayed the utmost gallantry and disregard of danger

Capt Harold Powell, Australian A.M C

For conspicuous gallantry and devotion to duty in continually working under heavy fire and the most adverse conditions with complete disregard for his personal safety As medical officer he is invaluable to his battalion, not only in regard to his assistance in keeping the men medically and physically fit but by his example of coolness, courage, and good humour when under fire.

Temp Capt. Laurence Cecil Sebastian Roche, R.A.M C

For conspicuous gallantry and devotion to duty when in charge of forward stretcher-bearers. He worked under an intense barrage fire with his bearers, collecting and successfully evacuating large numbers of wounded, through a continuous barrage of 16 hours. His gallant conduct and personal disregard of all danger greatly inspired his men in the execution of their duty

Temp Capt John Ross, R A M C

For conspicuous gallantry and devotion to duty in remaining in the open from 6 A.M. to 9 P.M., dressing and attending the wounded of his own and other regiments under heavy shell fire He then went to assist another unit whose medical officer had been wounded and during the whole of the operations he set a splendid example of cheerfulness and boundless energy

Temp Lieut John Edward Sandilands R.A.M C

For conspicuous gallantry and devotion to duty in leading his bearers forward under heavy barrage to evacuate wounded. He continued throughout the day to organise and superintend the removal of casualties under heavy shell fire.

Temp Capt John Ingram Shepherd, R.A.M C

For conspicuous gallantry and devotion to duty in working unceasingly day and night under heavy shell fire The fire was so intense that many of the men he dressed were subsequently killed His work was marked by the utmost courage and disregard of personal safety under extremely trying conditions.

Capt Fritz Peter Max Solling Australian A.M C

For conspicuous gallantry and devotion to duty Although under constant shell fire for a fortnight he continued to attend to the casualties of his own and of other units on one occasion for a period of 2 hours without a break During a heavy hostile gas attack he displayed the utmost devotion and disregard of danger

Temp Capt Bernard Charles Tennent, R.A.M.C

For conspicuous gallantry and devotion to duty in continually exposing himself with the utmost fearlessness under heavy shell fire in order to visit his posts in the front trenches. He dressed many men in the open regardless of personal danger and when his bearers became casualties he took their place and assisted to carry the wounded himself

Capt Cedric William Whiting Australian A.M C

For conspicuous gallantry and devotion to duty when in charge of stretcher-bearers He displayed the greatest ability in keeping touch with the aid post and in clearing the wounded, twice taking his bearers through a heavy barrage for this purpose His pluck and determination were beyond all praise

Temp Capt Herbert George Willis, R A M C

For conspicuous gallantry and devotion to duty in leading his men to the front line trenches to assist regimental stretcher bearers He was conspicuous in dressing the wounded under heavy fire taking out a party and exposing himself with the utmost fearlessness thereby ensuring all the wounded being removed to the aid posts

Capt Roy Coupland Winn Australian A M C

For conspicuous gallantry and devotion to duty when in charge of stretcher bearers He constantly patrolled the bearer line under very heavy shell fire maintaining communication between aid-posts and dressing stations and on one occasion he took a squad across the open through an intense barrage to an aid post in order to relieve a temporary [illegible] of wounded. He was twice wounded the [illegible] time [illegible] and [illegible] [illegible] was the means of saving many lives

Capt John Smythe Yule, Australian A M C

For conspicuous gallantry and devotion to duty whilst under heavy shell fire. Although gassed early in the operation he remained continuously on duty for two days, during which time 450 cases passed through his hands He has shown great gallantry on numerous previous occasions.

The following awards to and promotions of medical officers are particular to the operations in Mesopotamia —

THE CENTRAL MEDICAL WAR COMMITTEE

At a meeting of the Committee held on August 29th the following resolution was passed —

> This meeting of the Central Medical War Committee represents to the Government that in view of the composition of the Committee of Inquiry (the only intimation of which it has received through the public press) it is emphatically of opinion that unless at least the chairman of the Central Medical War Committee is added thereto the personnel of the new committee will not satisfy the opinion of the general body of medical practitioners in this country

The resolution has been communicated to the Secretary of State for War

THE IVORY CROSS AND "DEARER DENTISTRY"

It has been brought to the notice of the Council of the Ivory Cross that certain papers have announced in paragraphs obviously inspired by untrained dental practitioners, that the fees paid by this organisation have been raised Captain the Right Hon Lord Greville, as chairman, states in reply that the fees accepted by the qualified dentists are exactly the same as paid by the Soldiers and Sailors' Dental Aid Fund founded in 1914 of which the Ivory Cross is the outcome—this in spite of the increased cost of establishment charges and of all dental materials. An additional strain is thereby thrown upon the patriotism of a professional class hard hit in many directions by the war All officials are volunteers giving their services, and the generous help of many specialists is at the disposal of the Fund, its good work grows daily in volume and is only limited by the amount of moneys subscribed by a generous public Donations in aid of its national work of mercy may be sent to the honorary treasurer, Sir Herbert Bartlett Bart 10, Conduit-street W 1

TREATMENT OF DISABLED SOLDIERS IN SCOTLAND

Mr Duncan Millar asked the Minister of Pensions in the House of Commons recently to state the number of schemes which had been approved in Scotland for the treatment of disabled soldiers and the arrangements which had been completed by the local committee set up in Scotland to deal with this subject Mr Barnes replied that no general schemes for the institutional treatment of disabled soldiers have yet been submitted by local committees in Scotland on the lines set out in the recent instructions issued by the Ministry of Pensions but that the Statutory Committee have approved of the use of 240 institutions in Scotland and local committees are able to send cases direct to these institutions in accordance with the terms of approval The Joint Institutional Committee for Scotland, which has lately been constituted is now making arrangements for the purposes of a neurasthenic home near Edinburgh and for a number of orthopaedic annexes The treatment of discharged sailors and soldiers suffering from rheumatism is undertaken at Moffat and Strathpeffer and the provision of increased accommodation for paraplegics and for men suffering from epilepsy and tuberculosis is under consideration

The War.

THE CASUALTY LIST

THE following names of medical officers appear among the casualties announced since our last issue —

Killed

Capt J B Rawlins, R A M C, was a student at St Mary's Hospital, London, and qualified in August, 1914 He joined up shortly afterwards and was attached to a Highland Field Ambulance

Major E F B Wilson, South African M C, qualified at Dublin in 1881, and after practising for a few years in Ireland proceeded to South Africa, where he settled at Harrismith

Lieut Col F D Blandy, R A M C, was a student at the Middlesex Hospital and qualified in 1900 Before joining up in the spring of 1915 he was in practice at Tynemouth, Northumberland and held several local appointments

Capt H D Eccles, R A M C, attached Royal Irish Rifles, was a student at Guy's Hospital, London, and qualified in 1893 Before joining up he was in practice at Kawakawa, New Zealand, where he was medical officer to the Bay of Islands Maternity and General Hospital

Died

Capt D Arthur, M C, I M S, qualified at Glasgow in 1905, and held the appointment of house physician at the Western Infirmary in that city He was afterwards assistant medical officer of health for Cheadle and joined the Indian Medical Service in 1909 He died while a prisoner of war at Entelli, Turkey in Asia The award of the M C was recorded in THE LANCET of Oct 28th, 1916, p 770

Brigade Surgeon Lieut Col H A de Lantour, V D, received his medical education at King's College, London, and qualified in 1874 He was in practice at Wellington, New Zealand, before going on active service, and died at Invercargill

Capt H Y C Taylor, R A M C, qualified at Edinburgh in 1896, and before joining up was in practice at Bexhill-on Sea He had held appointments at the Throat Hospital, Golden square, at the Central London Ophthalmic Hospital, and at the Children's Hospital, Great Ormond street, London, and also at the Huddersfield Infirmary

Capt A. Traill, R A M C, qualified L M S S A in 1915, and joined up shortly afterwards

Wounded

Capt J C Metcalfe, M C R A M C
Capt H S Turner, M C, R A M C
Capt A. J O'Brien M C, West African Field Force
Major J P Kenny, Australian A M C
Capt J Kearney, R A M C
Lieut T C D Watt, R A M C
Capt D M Smith, R A M C
Capt C Dundee, R A.M C, attached Royal Irish Rifles
Capt F Harris, M C, R A.M C, attached R.F A
Lieut J H Mayston, R A.M C, attached Border Regiment
Capt R S Aspinall, R A M C
Capt W B Loveless, R A M C, attached Royal Irish Rifles
Capt S S Meighan, R A.M C
Capt R W Kenny, M C, Canadian A M C
Capt R D MacKenzie Canadian A M C

Missing

Capt A. K Sinha, I M S
Capt E Newton, R A.M C

CASUALTIES AMONG THE SONS OF MEDICAL MEN

The following additional casualties among the sons of medical men are reported —

Private W Worthington, Royal West Kent Regiment, killed in action, only son of Dr H Worthington, of Luton, Beds

Second Lieut G F H Moore, Border Regiment, accidentally killed, only surviving son of the late Col J H Moore, R A M C, of Wellington, Somerset

Second Lieut B W Penny, Royal Fusiliers, died of wounds, youngest son of Dr E J Penny of Wolverton, Bucks

Capt J O W Shine, Royal Dublin Fusiliers, killed in action, eldest and only surviving son of Col J M F Shine, A M S

Capt J A Cahill, M C, Royal Berkshire Regiment, killed in action only son of Dr J Cahill, of Seville street, London, S W

Second Lieut J S Reid, South Wales Borderers, died of wounds, only son of Dr E Reid, of Swansea

Lieut T H Stockwell, Canadian Infantry, killed in action, youngest son of the late Dr F Stockwell, of Bruton Somerset

Capt H O'Connor, M C, King's Shropshire Light Infantry died of wounds, eldest son of Mr C O'Connor, F R C S I, of Kildare

Cadet R Darling, Royal Irish Rifles, killed in action, youngest son of Dr J S Darling, of Lurgan, Ireland.

Capt C Dundee, R A M C, attached Royal Irish Rifles wounded, youngest son of Dr C Dundee, J P, of Ballycarry, co Antrim

Second Lieut C W S Magill, Royal Irish Fusiliers, wounded only son of the late Dr C Magill, of Lisburn co Antrim.

THE HONOURS LIST

The names of the following members of the medical profession are included in the first list of the recipients of the *Most Excellent Order of the British Empire* —

Knight Commander of the British Empire

Edward Stewart, Hon Lieut Col, R A.M C

Commander of the British Empire

Louisa Garrett Anderson
Florence Elizabeth, Lady Barrett
Jay Gould, Lieut Col, I M S
Thomas Wheeler Hart
Flora Murray
Mary Ann Dacomb Scharlieb
Mary Chalmers Watson

Officer of the British Empire

Wilfred Balgarnie, Temp Lieut, R A.M C
Duncan McFayden Millar
William Ernest Nelson

Member of the British Empire

Sidney John Oldacres Dickins
George Cooper Franklin, Lieut -Col, R A M C (T F)

The following awards to medical officers are announced —

Distinguished Service Order

Major Rupert Iggulden Furber, Australian A.M C

For conspicuous gallantry and devotion to duty He had charge of an advanced dressing station for five days during which it was under heavy shell fire most of the time He displayed the greatest ability and devotion to duty in organising the dressing and evacuation of a large number of the wounded, on several occasions helping to bring them in himself

Lieut Col John Smith Purdy, Australian A M C

For conspicuous gallantry and devotion to duty Although continually under shell fire for seven days, he exercised close personal supervision over the evacuation of the wounded and by his own example of courage and disregard of danger he animated all ranks with a similar attitude of mind. His work during preliminary preparations displayed the same untiring energy and devotion to duty

Bar to the Military Cross

Temp Capt Ernest Harrison Griffin, M.C, R A.M C

For conspicuous gallantry and devotion to duty He showed the greatest gallantry in rescuing wounded men by night from 'No Man's Land, where they had lain since dawn He worked for four hours under heavy and continued shell fire directing the bearers encouraging and personally assisting the wounded thereby enabling a large number of men to get back into our lines Whilst thus employed he went through the enemy's wire to within 60 yards of his position His work has been excellent since he came out in 1914 (The award of the M C was recorded in THE LANCET of Sept 2nd 1916 p 450)

Military Cross

Capt Jack Rowland Stanley Grose Beard, Australian A.M C

For conspicuous gallantry and devotion to duty on many occasions He carried out his duties in attending to the wounded under the most trying and difficult circumstances under heavy enfilading artillery fire, afterwards refusing to leave his aid post although it was blown in and he was buried On the following day he went out into a hostile barrage and brought in two stretcher bearers who had been wounded At all times his fearless example had the most inspiring effect on his medical staff

Capt Wendell Inglis Clark, Australian A.M C

For conspicuous gallantry and devotion to duty He remained on duty for nearly three days with only four hours rest, attending to over 300 cases of wounded and working mostly under extremely heavy fire On many previous occasions he has done excellent work whilst under fire displaying the greatest courage and devotion.

Capt Laurence Bedford Elwell, Australian A M C

For conspicuous gallantry and devotion to duty He personally organised with great ability and entire disregard of his own safety the evacuation of wounded along a route which was under direct enemy observation and subjected to heavy rifle and machine-gun fire. On another occasion he twice visited an aid post under intense hostile barrage to assist the officer in charge displaying as on all other occasions the utmost fearlessness and devotion to duty

Capt Raphael Leo Kenihan, Australian A.M C

For conspicuous gallantry and devotion to duty He established the most forward regimental aid post in his division where he attended to the wounded under heavy shell fire the whole time Although himself slightly wounded and compelled to shift his post twice by hostile shell fire he continued to attend all his cases with the greatest care and devotion saving many lives by remaining in his forward position and setting a magnificent example

Temp Lieut. George Errington Lloyd, R.A.M.C

For conspicuous gallantry and devotion to duty He went forward to a captured position on his own initiative and established an aid post under shell-fire, amongst shell-holes, where he rendered valuable assistance to the wounded and was always at hand when casualties occurred

Capt Keith Shelley Parker, Australian A.M.C

For conspicuous gallantry and devotion to duty He went forward under heavy artillery and machine-gun fire and established his aid post in a shell-hole, where he worked under most adverse conditions for five days without rest, attending the wounded of many units He was under shell-fire the whole time, and set a splendid example of devotion to duty

Temp Capt. Charles James Lodge Patch, R.A.M.C

For conspicuous gallantry and devotion to duty in attending to a wounded officer in the front line and removing him to a place of safety During the whole time he was under shell-fire by which he was wounded in two places, but disregarded his own wounds until those of the officer had been dressed. His devotion to duty and contempt of danger when under fire have been most marked on many occasions

Temp Lieut Frank Gordon Pedley, R.A.M.C (Lieut., Canadian A.M.C.)

For conspicuous gallantry and devotion to duty in proceeding to a dug-out, which had been hit by enemy shell fire, and saving the lives of many of the occupants He afterwards went through a very heavy barrage to attend to a badly wounded officer whom he eventually brought back to the dressing station. On both occasions he displayed the utmost gallantry and disregard of danger

Capt. Harold Powell, Australian A.M.C

For conspicuous gallantry and devotion to duty in continually working under heavy fire and the most adverse conditions, with complete disregard for his personal safety As medical officer he is invaluable to his battalion, not only in regard to his assistance in keeping the men medically and physically fit, but by his example of coolness, courage, and good humour when under fire.

Temp Capt. Laurence Cecil Sebastian Roche, R.A.M.C

For conspicuous gallantry and devotion to duty when in charge of forward stretcher-bearers. He worked under an intense barrage fire with his bearers, collecting and successfully evacuating large numbers of wounded, through a continuous barrage of 16 hours. His gallant conduct and personal disregard of all danger greatly inspired his men in the execution of their duty

Temp Capt. John Ross, R.A.M.C

For conspicuous gallantry and devotion to duty in remaining in the open from 6 A.M. to 9 P.M., dressing and attending the wounded of his own and other regiments under heavy shell-fire. He then went to assist another unit whose medical officer had been wounded, and during the whole of the operations he set a splendid example of cheerfulness and boundless energy

Temp Lieut. John Edward Sandilands, R.A.M.C

For conspicuous gallantry and devotion to duty in leading his bearers forward under heavy barrage to evacuate wounded. He continued throughout the day to organise and superintend the removal of casualties under heavy shell-fire.

Temp Capt. John Ingram Shepherd, R.A.M.C

For conspicuous gallantry and devotion to duty in working unceasingly day and night under heavy shell-fire. The fire was so intense that many of the men he dressed were subsequently killed. His work was marked by the utmost courage and disregard of personal safety under extremely trying conditions.

Capt Fritz Peter Max Solling, Australian A.M.C

For conspicuous gallantry and devotion to duty Although under constant shell-fire for a fortnight he continued to attend to the casualties of his own and of other units, on one occasion for a period of 2[illegible] hours without a break. During a heavy hostile gas attack he displayed the utmost devotion and disregard of danger

Temp Capt Bernard Charles Tennent, R.A.M.C

For conspicuous gallantry and devotion to duty in continually exposing himself with the utmost fearlessness under heavy shell-fire in order to visit his posts in the front trenches. He dressed many men in the open, regardless of personal danger, and when his bearers became casualties he took their place and assisted to carry the wounded himself

Capt. Cedric William Whiting, Australian A.M.C

For conspicuous gallantry and devotion to duty when in charge of stretcher-bearers He displayed the greatest ability in keeping touch with the aid post and in clearing the wounded, twice taking his bearers through a heavy barrage for this purpose. His pluck and determination were beyond all praise.

Temp Capt Herbert George Willis, R.A.M.C

For conspicuous gallantry and devotion to duty in leading his men into the front-line trenches to assist regimental stretcher-bearers He was continuous in dressing the wounded under heavy fire taking up a party and exposing himself with the utmost fearlessness, thereby ensuring all the wounded being removed to the aid posts

Capt Roy Coupland Winn, Australian A.M.C

For conspicuous gallantry and devotion to duty when in charge of stretcher-bearers He constantly patrolled the bearer line under very heavy shell-fire maintaining communication between aid posts and dressing station and on one occasion he took a squad across the open through an intense barrage to an aid-post in order to relieve a temporary glut of wounded. He was twice wounded, the second time severely, and his gallant conduct was the means of saving many lives

Capt John Smythe Yule, Australian A.M.C

For conspicuous gallantry and devotion to duty whilst under heavy shell fire. Although gassed early in the operation he remained continuously on duty for two days, during which time [illegible]0 cases passed through his hands He has shown great gallantry on numerous previous occasions

THE CENTRAL MEDICAL WAR COMMITTEE.

At a meeting of the Committee held on August 29th the following resolution was passed —

> This meeting of the Central Medical War Committee represents to the Government that in view of the composition of the Committee of Inquiry (the only intimation of which it has received through the public press) it is emphatically of opinion that unless at least the chairman of the Central Medical War Committee is added thereto the personnel of the new committee will not satisfy the opinion of the general body of medical practitioners in this country

The resolution has been communicated to the Secretary of State for War

THE IVORY CROSS AND "DEARER DENTISTRY"

It has been brought to the notice of the Council of the Ivory Cross that certain papers have announced in paragraphs, obviously inspired by untrained dental practitioners, that the fees paid by this organisation have been raised. Captain the Right Hon Lord Greville, as chairman states in reply that the fees accepted by the qualified dentists are exactly the same as paid by the Soldiers and Sailors Dental Aid Fund founded in 1914 of which the Ivory Cross is the outcome—this in spite of the increased cost of establishment charges and of all dental materials. An additional strain is thereby thrown upon the patriotism of a professional class hard hit in many directions by the war All officials are volunteers giving their services, and the generous help of many specialists is at the disposal of the Fund, its good work grows daily in volume and is only limited by the amount of moneys subscribed by a generous public. Donations in aid of its national work of mercy may be sent to the honorary treasurer, Sir Herbert Bartlett, Bart, 10 Conduit-street, W 1.

TREATMENT OF DISABLED SOLDIERS IN SCOTLAND

Mr Duncan Millar asked the Minister of Pensions in the House of Commons recently to state the number of schemes which had been approved in Scotland for the treatment of disabled soldiers and the arrangements which had been completed by the local committee set up in Scotland to deal with this subject Mr Barnes replied that no general schemes for the institutional treatment of disabled soldiers have yet been submitted by local committees in Scotland on the lines set out in the recent instructions issued by the Ministry of Pensions, but that the Statutory Committee have approved of the use of 2[illegible]0 institutions in Scotland, and local committees are able to send cases direct to these institutions in accordance with the terms of approval The Joint Institutional Committee for Scotland which has lately been constituted is now making arrangements for the purposes of a neurasthenic home near Edinburgh and for a number of orthopædic annexes The treatment of discharged sailors and soldiers suffering from rheumatism is undertaken at Moffat and Strathpeffer, and the provision of increased accommodation for paraplegics and for men suffering from epilepsy and tuberculosis is under consideration

The War.

THE CASUALTY LIST

THE following names of medical officers appear among the casualties announced since our last issue —

Killed

Capt J B Rawlins, R A M C, was a student at St Mary's Hospital, London, and qualified in August, 1914 He joined up shortly afterwards and was attached to a Highland Field Ambulance

Major E F B Wilson, South African M C, qualified at Dublin in 1881, and after practising for a few years in Ireland proceeded to South Africa, where he settled at Harrismith

Lieut Col F D Blandy, R A.M C, was a student at the Middlesex Hospital and qualified in 1900 Before joining up in the spring of 1915 he was in practice at Tynemouth, Northumberland and held several local appointments

Capt H D Eccles, R A M C, attached Royal Irish Rifles, was a student at Guy's Hospital, London, and qualified in 1893 Before joining up he was in practice at Kawakawa, New Zealand, where he was medical officer to the Bay of Islands Maternity and General Hospital

Died

Capt D Arthur, M C, I M S, qualified at Glasgow in 1905, and held the appointment of house physician at the Western Infirmary in that city He was afterwards assistant medical officer of health for Cheadle, and joined the Indian Medical Service in 1909 He died while a prisoner of war at Entelli, Turkey in Asia The award of the M C was recorded in THE LANCET of Oct 28th, 1916, p 770

Brigade-Surgeon Lieut Col H A de Lautour, V D, received his medical education at King's College, London, and qualified in 1874 He was in practice at Wellington, New Zealand, before going on active service, and died at Invercargill

Capt H Y C Taylor, R A M C, qualified at Edinburgh in 1896, and before joining up was in practice at Bexhill on Sea He had held appointments at the Throat Hospital, Golden square, at the Central London Ophthalmic Hospital, and at the Children's Hospital, Great Ormond street, London, and also at the Huddersfield Infirmary

Capt A Traill R A M C, qualified L M S S A in 1915, and joined up shortly afterwards

Wounded

Capt J C Metcalfe, M C R A M C
Capt H S Turner, M C, R A M C

George Cooper Franklin, Lieut Col, R A.M C (T.F)

The following awards to medical officers are announced —

Distinguished Service Order

Major Rupert Iggulden Furber, Australian A.M C

For conspicuous gallantry and devotion to duty He had charge of an advanced dressing station for five days during which it was under heavy shell fire most of the time He displayed the greatest ability and devotion to duty in organising the dressing and evacuation of a large number of the wounded, on several occasions helping to bring them in himself

Lieut Col John Smith Purdy, Australian A M C

For conspicuous gallantry and devotion to duty Although continually under shell fire for seven days he exercised close personal supervision over the evacuation of the wounded and by his own example of courage and disregard of danger he animated all ranks with a similar attitude of mind His work during preliminary preparations displayed the same untiring energy and devotion to duty

Bar to the Military Cross

Temp Capt Ernest Harrison Griffin, M C, R A M C

For conspicuous gallantry and devotion to duty He showed the greatest gallantry in rescuing wounded men by night from ' No Man's Land " where they had lain since dawn He worked for four hours under heavy and continued shell fire directing the bearers encouraging and personally assisting the wounded thereby enabling a large number of men to get back into our lines Whilst thus employed he went through the enemy's wire to within 60 yards of his position. His work has been excellent since he came out in 1914 (The award of the M C was recorded in THE LANCET of Sept. 2nd, 1916 p 450)

Military Cross

Capt Jack Rowland Stanley Grose Beard, Australian A M C

For conspicuous gallantry and devotion to duty on many occasions He carried out his duties in attending to the wounded under the most trying and difficult circumstances under heavy enfilading artillery fire afterwards refusing to leave his aid post, although it was blown in and he was buried On the following day he went out into a hostile barrage and brought in two stretcher bearers who had been wounded At all times his fearless example had the most inspiring effect on his medical staff

Capt Wendell Inglis Clark, Australian A M C

For conspicuous gallantry and devotion to duty He remained on duty for nearly three days with only four hours rest, attending to over 300 cases of wounded and working mostly under extremely heavy fire On many previous occasions he has done excellent work whilst under fire displaying the greatest courage and devotion

Capt Laurence Bedford Elwell, Australian A M C

For conspicuous gallantry and devotion to duty He personally organised, with great ability and entire disregard of his own safety the evacuation of wounded along a route which was under direct enemy observation and subjected to heavy rifle and machine-gun fire On another occasion he twice visited an aid post under intense hostile barrage to assist the officer in charge displaying as on all other occasions the utmost fearlessness and devotion to duty

Capt Raphael Leo Kenihan, Australian A.M C

For conspicuous gallantry and devotion to duty He established the most forward regimental aid post in his division where he attended to the wounded under heavy shell fire the whole time Although himself slightly wounded and compelled to shift his post twice by hostile shell fire he continued to attend all his cases with the greatest care and devotion saving many lives by remaining in his forward position and setting a magnificent example

Temp Lieut. George Errington Lloyd, R A M C

For conspicuous gallantry and devotion to duty He went forward to a captured position on his own initiative, and established an aid post under shell fire amongst shell holes where he rendered valuable assistance to the wounded and was always at hand when casualties occurred

Capt Keith Shelley Parker, Australian A M C

For conspicuous gallantry and devotion to duty He went forward under heavy artillery and machine-gun fire, and established his aid post in a shell hole, where he worked under most adverse conditions for five days without rest, attending the wounded of many units He was under shell fire the whole time and set a splendid example of devotion to duty

Temp Capt Charles James Lodge Patch, R A M C

For conspicuous gallantry and devotion to duty in attending to a wounded officer in the front line and removing him to a place of safety During the whole time he was under shell fire by which he was wounded in two places, but disregarded his own wounds until those of the officer had been dressed His devotion to duty and contempt of danger when under fire have been most marked on many occasions

Temp Lieut Frank Gordon Pedley, R A.M C (Lieut, Canadian A M C)

For conspicuous gallantry and devotion to duty in proceeding to a dug out, which had been hit by enemy shell fire, and saving the lives of many of the occupants He afterwards went through a very heavy barrage to attend to a badly wounded officer whom he eventually brought back to the dressing station On both occasions he displayed the utmost gallantry and disregard of danger

Capt Harold Powell, Australian A M C

For conspicuous gallantry and devotion to duty in continually working under heavy fire and the most adverse conditions with complete disregard for his personal safety As medical officer he is invaluable to his battalion, not only in regard to his assistance in keeping the men medically and physically fit, but by his example of coolness courage and good humour when under fire

Temp Capt Laurence Cecil Sebastian Roche, R A.M C

For conspicuous gallantry and devotion to duty when in charge of forward stretcher-bearers He worked under an intense barrage fire with his bearers collecting and successfully evacuating large numbers of wounded through a continuous barrage of 16 hours His gallant conduct and personal disregard of all danger greatly inspired his men in the execution of their duty

Temp Capt John Ross, R A.M C

For conspicuous gallantry and devotion to duty in remaining in the open from 6 A.M to 9 P M dressing and attending the wounded of his own and other regiments under heavy shell fire He then went to assist another unit whose medical officer had been wounded, and during the whole of the operations he set a splendid example of cheerfulness and boundless energy

Temp Lieut John Edward Sandilands, R.A.M C

For conspicuous gallantry and devotion to duty in leading his bearers forward under heavy barrage to evacuate wounded He continued throughout the day to organise and superintend the removal of casualties under heavy shell fire

Temp Capt John Ingram Shepherd, R A.M C

For conspicuous gallantry and devotion to duty in working unceasingly day and night under heavy shell fire The fire was so intense that many of the men he dressed were subsequently killed His work was marked by the utmost courage and disregard of personal safety under extremely trying conditions

Capt Fritz Peter Max Solling, Australian A M C

For conspicuous gallantry and devotion to duty Although under constant shell fire for a fortnight he continued to attend to the casualties of his own and of other units, on one occasion for a period of 24 hours without a break During a heavy hostile gas attack he displayed the utmost devotion and disregard of danger

Temp Capt Bernard Charles Tennent, R A.M C

For conspicuous gallantry and devotion to duty in continually exposing himself with the utmost fearlessness under heavy shell fire in order to visit his posts in the front trenches He dressed many men in the open regardless of personal danger and when his bearers became casualties he took their place and assisted to carry the wounded himself

Capt Cedric William Whiting, Australian A M C

For conspicuous gallantry and devotion to duty when in charge of stretcher bearers He displayed the greatest ability in keeping touch with the aid post and in clearing the wounded twice taking his bearers through a heavy barrage for that purpose His pluck and determination were beyond all praise

Temp Capt Herbert George Willis, R A M C

For conspicuous gallantry and devotion to duty in leading his men into the front-line trenches to assist regimental stretcher bearers He was conspicuous in dressing the wounded under heavy fire taking out a party and exposing himself with the utmost fearlessness thereby ensuring all the wounded being removed to the aid posts

Capt Roy Coupland Winn Australian A M C

For conspicuous gallantry and devotion to duty when in charge of stretcher bearers. He constantly patrolled the bearer line under very heavy shell fire maintaining communication between aid posts and dressing stations and on one occasion he took a squad across the open through an intense barrage to an aid post in order to relieve a temporary glut of wounded He was twice wounded the second time severely and his gallant conduct was the means of saving many lives

Capt John Smythe Yule, Australian A M C

For conspicuous gallantry and devotion to duty whilst under heavy shell fire Although gassed early in the operation he remained continuously on duty for two days during which time 450 cases passed through his hands He has shown great gallantry on numerous previous occasions

THE CENTRAL MEDICAL WAR COMMITTEE

At a meeting of the Committee held on August 29th the following resolution was passed —

This meeting of the Central Medical War Committee represents to the Government that, in view of the composition of the Committee of Inquiry (the only intimation of which it has received through the public press) it is emphatically of opinion that unless at least the chairman of the Central Medical War Committee is added thereto the personnel of the new committee will not satisfy the opinion of the general body of medical practitioners in this country

The resolution has been communicated to the Secretary of State for War

THE IVORY CROSS AND "DEARER DENTISTRY"

It has been brought to the notice of the Council of the Ivory Cross that certain papers have announced in paragraphs obviously inspired by untrained dental practitioners, that the fees paid by this organisation have been raised Captain the Right Hon Lord Greville as chairman, states in reply that the fees accepted by the qualified dentists are exactly the same as paid by the Soldiers and Sailors' Dental Aid Fund, founded in 1914, of which the Ivory Cross is the outcome—this in spite of the increased cost of establishment charges and of all dental materials An additional strain is thereby thrown upon the patriotism of a professional class hard hit in many directions by the war All officials are volunteers giving their services, and the generous help of many specialists is at the disposal of the Fund, its good work grows daily in volume and is only limited by the amount of moneys subscribed by a generous public Donations in aid of its national work of mercy may be sent to the honorary treasurer, Sir Herbert Bartlett, Bart, 10, Conduit-street, W 1

TREATMENT OF DISABLED SOLDIERS IN SCOTLAND

Mr Duncan Millar asked the Minister of Pensions in the House of Commons recently to state the number of schemes which had been approved in Scotland for the treatment of disabled soldiers, and the arrangements which had been completed by the local committee set up in Scotland to deal with this subject Mr Barnes replied that no general schemes for the institutional treatment of disabled soldiers have yet been submitted by local committees in Scotland on the lines set out in the recent instructions issued by the Ministry of Pensions, but that the Statutory Committee have approved of the use of 240 institutions in Scotland, and local committees are able to send cases direct to these institutions in accordance with the terms of approval The Joint Institutional Committee for Scotland, which has lately been constituted, is now making arrangements for the purposes of a neurasthenic home near Edinburgh and for a number of orthopædic annexes. The treatment of discharged sailors and soldiers suffering from rheumatism is undertaken at Moffat and Strathpeffer, and the provision of increased accommodation for paraplegics and for men suffering from epilepsy and tuberculosis is under consideration

OBITUARY OF THE WAR

GEORGE STEPHEN PIRIE, M B, CH B EDIN,

CAPTAIN ROYAL ARMY MEDICAL CORPS

Captain G S Pirie, who was killed in action in France on July 24th, on his twenty ninth birthday, was the second son of the late George Pirie, of Leopards Vlei and Wonder Heuvel, Cape Colony, and of Banff, Scotland He was educated at St Andrew's College, Grahamstown, South Africa, entering the University of Edinburgh in 1909, graduating M B, Ch.B with distinction in July, 1914 He then held the post of senior house physician at the Leith Hospital, resigning this appointment to take a commission in the Royal Army Medical Corps He was sent out to Gallipoli, where he saw much service with the Royal Fusiliers He was wounded and returned to England to recover Later he went to France as medical officer to the East Surrey Regiment, with which he remained until his death, being mentioned several times in despatches. While tending the wounded in the trenches he was instantly killed by a shell

Captain Pirie was popular with his fellow students and teachers at Edinburgh University, where he belonged to the medical unit of the O T C His superior officers write of him as an able medical officer who gave of his best to those under his care without thought of himself.

FRANK WHINCUP, F R C S EDIN,

LIEUTENANT ROYAL ARMY MEDICAL CORPS

Lieutenant F Whincup, who was accidentally drowned whilst bathing at Havre on July 2nd, at the age of 42 years, was the third and youngest son of the late Charles Todd Whincup, of Green Hammerton, Yorks He was educated at Leeds Grammar School and St Bartholomew's Hospital, taking the diplomas of the Conjoint Board in 1897 After holding resident appointments at the Royal Salop Infirmary, Shrewsbury, the Devon and Cornwall Hospital, Plymouth, and the Stroud General Hospital, he returned to Shrewsbury in 1900 to enter into general practice with Mr Harold H B MacLeod, and did much work at the Eye, Ear, and Throat Hospital as assistant and anæsthetist under Mr C G Russ Wood Three years ago he was elected physician to the Royal Salop Infirmary One of his colleagues there writes of him "It is, perhaps, at the infirmary, more than anywhere, that his loss to the profession will be most seriously felt He possessed a marvellously retentive memory, and never apparently forgot anything he had read or any case he had seen, and this faculty, coupled with his own keen observation and ripe judgment, rendered his opinion one of great value to his colleagues, medical and surgical alike Although in his forty-third year, and engaged in a large practice, he felt it his duty to offer himself to the R A M C, and in order to fit himself for military service he underwent an operation for radical cure of hernia and removal of an appendix which had caused him trouble It was his bright, cheery personality, his keen sense of humour, and his ever ready willingness to help either his patients or his professional brethren that endeared him to so many in and around Shrewsbury, where his loss is mourned by rich and poor alike"

JAMES HENRY HORTON, M R C S ENG,

DISTINGUISHED SERVICE ORDER

BREVET LIEUTENANT COLONEL, INDIAN MEDICAL SERVICE.

Lieutenant-Colonel James Henry Horton, who died of heat-stroke in Mesopotamia on July 23rd, at the age of 46 years, was eldest son of Major James Horton, retired, 4th Dragoon Guards He was educated at Guy's Hospital, where he won the Arthur Durham Prize, and after qualifying in 1895 held a house appointment at his own hospital and afterwards at the Priory, Roehampton, and the Bethlehem Hospital From 1899-1901 he was plague medical officer at Bombay, and in 1902 entered the Indian Medical Service, winning the Marshall Webb Prize while at the military school, Netley In Somaliland (1903-04) he took part in the actions of Daratolah and Iidhalli, receiving mention in despatches and being awarded the D S O In 1908 he was with the Mohmand Field Force, getting the medal and clasp. In the Balkan War (1912-13) he acted as a surgeon of the British Red Cross Society, again obtaining a medal and clasp. At the outbreak of hostilities he was personal assistant to the surgeon general with the Government of Bombay, and was sent to Mesopotamia as Deputy Assistant Director of Medical Services, being present at the relief of Kut and the capture of Bagdad. He was twice mentioned in despatches Colonel Horton also held the Order of St George and St. Vladimir of Russia

FREDERICK CECIL HOLMAN PIGGOTT, M D CAMB.,

CAPTAIN, ROYAL ARMY MEDICAL CORPS

Captain F C H Piggott, who died very suddenly at the Military Hospital, Sutton, on June 24th, at the age of 57 years, was educated at Merchant Taylors School and Emmanuel College, Cambridge, where he was a scholar and prizeman, continuing his medical studies at St Thomas's Hospital After taking the diploma of M R C S Eng in 1884 he was sent out by the National Aid Society as surgeon in the Sudan campaign of 1885, obtaining the medal and clasp "Suakim" and Khedive's bronze star and acting as H B M's Consul for East Sudan In the following year he took his medical degree at Cambridge, afterwards settling in practice at Teignmouth, where he became honorary consulting physician to the hospital and medical officer of health to the urban district and port sanitary authority During the first year of the war he gave up his extensive practice to take a commission in the Royal Army Medical Corps, being appointed specialist sanitary officer of the Wylye Valley district His death makes a blank in a wide circle of friends Captain Piggott leaves a widow and a son and daughter

Bt Lieut Col F Wall to be Assistant Director of Medical Services

Capt. W E R Williams to be Deputy Assistant Director of Medical Services

The King has approved the retirement of Lieut Col A. W Dawson (in consequence of ill health due to field service) and Lieut.-Col E C Hare (in consequence of ill health)

JOURNAL OF THE ROYAL ARMY MEDICAL CORPS

In the July issue of this journal which begins a new volume Captain David Thompson concludes his long article on the Diagnosis and Treatment of Malarial Fever With regard to the treatment he says In all cases whether acute chronic or latent and in cases of gamete carriers commence a thoroughly routine treatment as early as possible with the idea of obtaining a permanent cure from the beginning The treatment may be considered severe but it pays and it means that less quinine will be needed in the long run." Ten to 15 grains of quinine in solution are given by the mouth three times daily for three weeks hypodermic injections in some cases, and small doses of liquor arsenicalis Temporary Colonel Andrew Fullerton consulting surgeon to the British Expeditionary Forces describes the use of the opaque ureteral catheter to localise missiles in the region of the kidney and ureter and Major A R Ferguson contributes some notes on bilharziasis, in which he says the essential facts with regard to its mode of infection are now so well known that the necessary measures for its avoidance may be made precise and should be stringently enforced in the hope that military efficiency may not be impaired in the immediate future and that the country may be saved the payment of large sums in compensation to men who need not have been infected Captain W J Tulloch has a paper on the differentiation by means of the absorption of agglutinin test of the types of meningococci obtained from the cerebrospinal fluid Major F W Mott's paper on Punctiform Hæmorrhages of the Brain in Gas Poisoning read before the Royal Society of Medicine is reprinted and there are some interesting notes on the venereal division of the general hospital Alexandria, by Captain W C Jardine. Possibly " says the author "as a result of the lectures on venereal disease which have been given to troops in Egypt and of the stories told by the venereal patients on discharge from hospital we find that the soldiers report sick very early in fact usually as soon as the sore appears On this account we rely a great deal on our bacteriologist for an early diagnosis of syphilis Cases with well marked secondaries are diagnosed clinically and put under treatment at once. . . . The average period in hospital for patients has been: Syphilis, 39 days gonorrhœa, 34 days soft chancre 30 days "

ARGUMENT AND AGREEMENT

To the Editor of THE LANCET

SIR,—The plain man finds it somewhat disconcerting to note how often nowadays eminent medical controversialists are complaining that their arguments are misunderstood by their opponents, or that they themselves fail completely to comprehend those of the other side Phrases such as "I frankly confess I don't understand him," and "It is quite apparent that he does not understand me" are of distressingly frequent occurrence Yet it is quite obvious that in the case of two such men as Sir Clifford Allbutt and Sir James Mackenzie neither can possibly be as "slow in the uptak'" as is implied The matter is really, I think, a code difficulty Each talks in a language foreign to the other, and translation is imperfect Some interesting considerations seem thereby to present themselves

As we come more closely to grips with the nature of things, we leave farther and farther behind us those elemental crudities of thought which can be fairly accurately expressed and conveyed to another mind by the agency of the written or spoken word When the thoughts and ideas we have to transmit become more and more subtle, we become increasingly conscious of the unsatisfactory nature of the medium of intercourse and the thought leakage which occurs owing, as it were, to the high resistance encountered in transmission Is it necessary to conclude, then, that the ideas now to be conveyed are so subtle and tenuous that we may be faced ultimately with a bankruptcy of language, and that thought may so far outstrip its codes of expression that progress may be seriously hampered thereby? There are, at any rate, some remedies we can apply before things come to such a pass

It is due to an imperfect appreciation of these considerations that we find such a mass of merely verbal criticism in present-day scientific communications—so much argument and so little agreement In order that progress may be made economically without unnecessary waste of time and effort, it is just as important to ascertain where we are in agreement with others as where we differ from them The possibility that another man may be using a different code from the one to which we are accustomed, or may indeed have originated, is not always suspected The recent controversy between *Professor* Bayliss and Mr MacDonagh is an excellent case in point Many misunderstandings would be avoided did a debater endeavour faithfully to translate the code of the other man before coming to the conclusion that the opponent is writing nonsense. If we see a paper in a foreign language with which we are imperfectly acquainted we do not condemn its statements until we are satisfied that we have made an accurate translation It is perhaps natural, however, to be a little intolerant, and to wish to impress our own particular code upon all men

I do not wish it to be thought that I hold any brief for inaccuracy or obscurity in expression, but we have to remember that, unfortunately, Raphael Hythlodaye did not preserve for us the Utopian alphabet The best remedy, failing a perfect code, is to make as sure as we can that the ideas conveyed to our minds are identical with those originating in the mind of a writer, not forgetting that, as Thoreau said of truth, it takes two to express a thought If we were more careful over our translations we should find doubtless that many truths, hotly debated, were in reality denied by none, and new truths would have a better chance of acceptance, because they would stand out more clean cut and clear

I am, Sir, yours faithfully

E W ADAMS

August 28th 1917

THE STUDY OF FUNCTION IN DISEASE

To the Editor of THE LANCET

SIR,—In a leading article in THE LANCET of May 26th, p 805, the importance of considering the functional capacity of organs, even when diseased, is insisted on, and although it is often extremely important to understand the exact pathological condition of any organ, we should, I think, remember that from the patient's standpoint, except in so far as such knowledge can favourably influence treatment the actual condition of an organ may be immaterial, the important feature, from his point of view, is how far he can go on with his work and what his ultimate prospects in life are going to be Thus, in a disease so common as tuberculosis many individuals have lesions which may or may not be demonstrated physically, or by the X rays, which nevertheless give rise to no symptom of ill health, and may never cause any trouble even in the course of a long life We are therefore thrown back on some other method of discovering the necessity or otherwise for treatment, and we shall find that our only resource consists in a consideration of the patient's symptoms together with accurate estimations of the temperature Too often, time which is most valuable at a given stage of disease is put off, whilst we wait for some event which will clinch the diagnosis, time which should have been used in bringing about the cessation of the symptoms and which in many instances would have prevented the occurrence of such evidence as the finding of tubercle bacilli in sputum

In this connexion I do not think that my old and honoured preceptor Sir Thomas Clifford Allbutt is quite so hidebound in tradition as Sir James Mackenzie would imply In 1904 he allowed me to take my M.D degree at Cambridge for a thesis on the diagnosis of pulmonary tuberculosis which was largely a plea for the recognition of pulmonary tuberculosis not from physical signs but from symptoms In the final paragraph but one of this thesis which has not been published, occurs the following sentence

> 'In the consideration of diagnosis physical signs have been ignored, not in any spirit of disparagement nor yet because less able to appreciate them than some others, but rather in the belief that it is from symptoms and not from these that we shall gain most information at a time when diagnosis is still useful'

Sir James Mackenzie in THE LANCET of August 18th urges the importance of considering "the patient's sensations" as the most important factor as a warning of the onset of serious and, perhaps, if not treated correctly, of fatal disease, although he is chiefly concerned in his letter with heart disease, a matter with which I do not feel competent to deal, yet his observations certainly apply with great force to the diagnosis of pulmonary tuberculosis For some years now I have endeavoured to insist that the most important matter in the diagnosis of pulmonary tuberculosis is the examination of symptoms which, of course, largely deals with the patient's sensations Until this matter is taken up by the profession, it is quite useless propounding schemes for the eradication and successful treatment of this malady Fortunately in tuberculosis it is much easier than in diseases of the heart to analyse a patient's sensations. It is eminently true of tuberculosis that "long before physical signs are evident the patient is conscious there is something amiss," also that "disease when it is so far advanced as to produce a physical sign, which means usually damage to the tissues, and is therefore beyond the stage of cure, is admitted to the hospital wards" (*so* sanatorium)

Many even now regard the finding of tubercle bacilli as a correct means of diagnosing pulmonary tuberculosis, for the purpose of deciding whether a patient should undergo sanatorium treatment If I might be allowed to give an opinion, such a discovery more often means that the patient has passed beyond the early stage, and therefore is not a suitable case for treatment in a sanatorium, even in chronic cases, which often go on for years it will often be found difficult to find the tubercle bacillus, and when these do appear abundantly and are found easily, as a rule the course of the disease is not long protracted

I am, Sir yours faithfully

EDWARD E PREST

Ayrshire Sanatorium New Cumnock August 28th 1917

RAT-BORNE FEVER

To the Editor of THE LANCET

SIR,—I was very pleased with the suggestion contained in the annotation on rat-borne fever appearing in THE LANCET of August 11th that there may be a causal connexion between rats and trench fever So long ago as the spring of 1915 I had this idea in mind when gathering material for a clinical note which you published in THE LANCET of Sept 25th, 1915, under the title "Rela psing Febrile Illness of Unknown Origin." I had read accounts of rat-bite fever in several text-books, and its close resemblance to the illness I noted and described struck me forcibly. I mentioned my suspicions to several bacteriologists from time to time, but so far none have produced evidence to confirm them. Subsequent clinical observations show that trench fever (as the illness I described is now called) does in the acute paroxysmal stage often drag on for weeks, and though, on the other hand, there are some who recover rapidly, there are others who remain debilitated for long after the acuter phases have passed.—I am, Sir, yours faithfully,

J. H. P. GRAHAM.

August 2[illegible]th, 1917.

URBAN VITAL STATISTICS

VITAL STATISTICS OF LONDON DURING JULY, 1917.

IN the accompanying table will be found summarised complete statistics relating to sickness and mortality in the City of London and in each of the metropolitan boroughs. With regard to the notified cases of infectious diseases, it appears that the number of persons reported to be suffering from one or other of the ten diseases specified in the table was equal to an annual rate of 3·5 per 1000 of the population, estimated at 4,237,237 persons; in the three preceding months the rates were 3·7, 3·5, and 3·4 per 1000 respectively. The lowest rates for the month were recorded in Paddington, Chelsea, the City of Westminster, Finsbury, and the City of London, and the highest rates in Bethnal Green, Southwark, Bermondsey, Wandsworth, Camberwell, and Greenwich. Scarlet fever was rather more prevalent than it had been in other recent months; the greatest proportional prevalence of this disease was recorded in Bethnal Green, Poplar, Bermondsey, Wandsworth, Camberwell, and Greenwich. The Metropolitan Asylums Hospitals contained 6[illegible] scarlet fever patients at the end of the month, against 712, 613, and 595 at the end of the three preceding months; the weekly admissions averaged 101, against 93, 92, and 63 in the three preceding months. The prevalence of diphtheria was also slightly in excess of that recorded in the two preceding months; this disease was proportionally most prevalent in St. Pancras, Holborn, Stepney, Southwark, Bermondsey, Deptford, and Greenwich. The number of diphtheria patients remaining under treatment in the Metropolitan Asylums Hospitals at the end of the month was 1070, against 1048 and 1012 at the end of the two preceding months; the weekly admissions averaged 142, against 129 and 133 in the two preceding months. Enteric fever was more prevalent than it had been in any of the earlier months of the year; of the 44 cases notified during July 8 belonged to Hammersmith, 6 to Wandsworth, 4 to Kensington, 4 to Stepney, 4 to Lambeth, 3 to Poplar, and 3 to Camberwell. There were 41 enteric fever patients under treatment in the Metropolitan Asylums Hospitals at the end of July, against 25, 27, and 31 at the end of the three preceding months; the weekly admissions averaged 7, against 6 in each of the two preceding months. Erysipelas was proportionally most prevalent in St. Marylebone, St. Pancras, Shoreditch, Deptford, and Greenwich. Of the 9 cases of puerperal fever notified during the month 2 belonged to Chelsea. The 15 cases of cerebro-spinal meningitis included 2 in Hackney and 2 in Camberwell, and the 2 cases of poliomyelitis belonged respectively to Stepney and Wandsworth.

The mortality statistics in the table relate to the deaths of persons actually belonging to the several boroughs, the deaths occurring in institutions having been distributed among the boroughs in which the deceased persons had previously resided. During the four weeks ending July 28th the deaths of 3535 London residents were registered, equal to an annual rate of 10·9 per 1000; in the three preceding months the rates had been 16·2, 13·9, and 12·0 per 1000 respectively. The death rates for the month ranged from 5·2 in the City of London, 8·4 in Lewisham, 8·5 in Fulham, 8·8 in Wandsworth, and 8·9 in Woolwich, to 12·3 in Finsbury, 12·6 in Stoke Newington, 12·7 in Bermondsey, 13·2 in Shoreditch, 13·7 in Holborn, 13·8 in Deptford, and 15·3 in Southwark. The 3535 deaths from all causes included 219 which were referred to the principal infectious diseases; of these 59 resulted from measles, 6 from scarlet fever, 37 from diphtheria, 34 from whooping-cough, 11 from enteric fever, and 72 from diarrhoea and enteritis among children under 2 years of age. No death from any of these diseases was recorded during the month in St. Marylebone, Holborn, or the City of London; among the other boroughs they caused the lowest death rates in the City of Westminster, Wandsworth, Lewisham, and Woolwich, and the highest rates in Finsbury, Poplar, Southwark, and Deptford. The 59 deaths from measles were somewhat below the corrected average number in the corresponding period of the five preceding years; this disease was proportionally most fatal in Paddington, Kensington, Hammersmith, Islington, Finsbury, and Deptford. The 6 fatal cases of scarlet fever were only one-third of the corrected average number, and belonged respectively to Paddington, Kensington, Hackney, Shoreditch, Lambeth, and Wandsworth. The 37 deaths from diphtheria were equal to the corrected average number, and included 5 belonging to Poplar, 5 to Southwark, 4 to St. Pancras, and 4 to Lambeth. The 34 fatal cases of whooping-cough were 24 below the corrected average, and included 4 in Poplar, 4 in Camberwell, and 3 each in Fulham, Islington, Hackney, Stepney, and Battersea. The 11 deaths from enteric fever were slightly below the corrected average number, and included 2 each in Southwark, Bermondsey, and Lambeth. The 72 fatal cases of diarrhoea and enteritis among children under 2 years of age were 23 below the corrected average; the greatest proportional mortality from this cause was recorded in Kensington, Fulham, Chelsea, and Southwark. In conclusion, it may be stated that the aggregate mortality in London during the month from these principal infectious diseases was nearly 25 per cent. below the average.

(Week ended August 18th, 1917.)

English and Welsh Towns.—In the 96 English and Welsh towns, with an aggregate civil population estimated at nearly 17,000,000 persons, the annual rate of mortality was 10·5 per 1000, against 11·2, 10·3, and 10·4 per 1000 in the three preceding weeks. In London, with a popu-

lation exceeding 4,000 000 persons, the death rate was 10 7, or 0 4 per 1000 above that recorded in the previous week among the remaining towns the death rates ranged from 3 2 in Ealing 5 0 in Cambridge and 5 5 in Edmonton, to 19 7 in Southend-on Sea, 20 3 in Huddersfield, and 21 1 in Dewsbury The principal epidemic diseases caused 338 deaths, which corresponded to an annual rate of 1 0 per 1000 and included 200 from infantile diarrhœa, 55 from measles, 34 from whooping-cough 28 from diphtheria 11 from scarlet fever 9 from enteric fever and 1 from small pox The deaths from diarrhœa which had increased from 53 to 180 in the four preceding weeks further rose to 200 and included 60 in London 21 in Liverpool 11 in West Ham and 9 each in Manchester and Leeds The fatal case of small pox belonged to Smethwick The 627 cases of scarlet fever and 1062 of diphtheria under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital were respectively 6 and 9 below the numbers remaining at the end of the previous week Of the 3412 deaths from all causes in the 96 towns 144 resulted from violence The causes of 37 deaths were uncertified, of which 4 were recorded in Stoke-on Trent, in Birmingham and in Liverpool and 3 in Leicester but not one in London.

Scotch Towns—In the 16 largest Scotch towns with an aggregate population estimated at 2,600 000 persons the annual death rate was 11 7 against 10 8 and 11 2 per 1000 in the two preceding weeks The 269 deaths in Glasgow corresponded to an annual rate of 12 6 per 1000, and included 29 from infantile diarrhœa 8 from whooping cough, 2 from measles and 1 from diphtheria The 88 deaths in Edinburgh were equal to a rate of 13 8 per 1000 and included 2 from diphtheria and 1 from whooping cough

Irish Towns—The 108 deaths in Dublin corresponded to an annual rate of 14 1 per 1000 and included 22 from infantile diarrhœa and 1 from diphtheria. The 85 deaths in Belfast were equal to a rate of 11 3 per 1000 and included 5 from infantile diarrhœa and 1 from whooping-cough

(Week ended August 25th, 1917)

English and Welsh Towns—In the 96 English and Welsh towns with an aggregate civil population estimated at nearly 17 000 000 persons the annual rate of mortality was 10·6 against 10 3 10 4 and 10·5 per 1000 in the three preceding weeks In London with a population exceeding 4 000 000 persons the death rate was 10 5 or 0·2 per 1000 less than in the previous week among the remaining towns the death rates ranged from 3 8 in Wimbledon 4 5 in Eastbourne, and 5 2 in Carlisle to 16 9 in York 17 3 in Tynemouth, and 20·9 in Stockton on Tees The principal epidemic diseases caused 411 deaths which corresponded to an annual rate of 1 3 per 1000 and included 274 from infantile diarrhœa, 66 from measles 30 from whooping-cough, 27 from diphtheria 10 from enteric fever and 4 from scarlet fever The deaths from diarrhœa, which had increased from 53 to 200 in the five preceding weeks further rose to 274 and included 72 in London 40 in Liverpool 22 in Manchester and 16 in Leeds The 614 cases of scarlet fever and 1063 of diphtheria under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital were respectively 13 below and 1 above the numbers remaining at the end of the previous week Of the 3463 deaths from all causes in the 96 towns 135 resulted from violence. The causes of 23 deaths were uncertified and included 6 in Birmingham 3 in Liverpool and 2 each in Stoke-on Trent and Manchester

Scotch Towns—In the 16 largest Scotch towns with an aggregate population estimated at nearly 2 500 000 persons the annual death rate was 10 3, against 11 2 and 11 7 per 1000 in the two preceding weeks The 245 deaths in Glasgow corresponded to an annual rate of 11 4 per 1000, and included 32 from infantile diarrhœa 9 from whooping cough 5 from measles and 2 from diphtheria. The 46 deaths in Edinburgh were equal to a rate of 7·2 per 1000 and included 1 from scarlet fever

Irish Towns—The 149 deaths in Dublin corresponded to an annual rate of 19 5 or 4 4 per 1000 above that recorded in the previous week and included 38 from infantile diarrhœa and 1 each from enteric fever whooping cough, and diphtheria. The 87 deaths in Belfast were equal to a rate of 11 5 per 1000 and included 7 from infantile diarrhœa

---

IRISH VITAL STATISTICS FOR 1916—During 1916 the marriage rate in Ireland (5 45 marriages per 1000 of the population) was 0 44 per 1000 under that for 1915 and 0·11 under the average for the 10 years 1906–15 The birth rate (21 1 per 1000 of the population) was 0 9 per 1000 under the rate for 1915 and 1 9 under the average for the 10 years 1906–15, and is the lowest ever recorded in Ireland The death rate was 16 46 per 1000, being 1 10 under the rate for 1915 and 0 55 under the average for the 10 years 1906–15 With the exception of the rate for 1912, which was 16 45, and that for 1914 (16 28), the death rate is the lowest since 1871 Turning to tuberculosis, the death rate was for all forms of the disease 2 15 per 1000 With the exception of 1912 (in which the rate was also 2 15), 1913 (2 14), and 1914 (2·07), the rate for 1916 was the lowest recorded in Ireland, but there is little to boast of when we consider that in the same year in England and Wales the mortality rate from consumption in all its types was 1 53 per 1000 and in Scotland 1 59 The infantile mortality was in Ireland during 1916 83 per 1000 births, being 9 under the rate (that is, per 1000 births) for 1915, and also 9 under the average for the 10 years' period 1906–15 The rate it is satisfact[illegible] is the lowest yet recorded The satisfact[illegible] he vital statistics for 1916 in Ireland[illegible] *To the Editor* rate generally the fall in the tuberc[illegible] leading article the slight improvement in the annual[illegible]ts, but it is most extraordinary to find t[illegible]portance of of all countries—there was during 1916 the lowe[illegible]when diser yet recorded, and that never were there so few[illegible] imports in Ireland as in 1916, notwithstanding that[illegible]anye ever remembers the country so prosperous, and[illegible], owing to the absence of compulsory service, so few m[illegible]—that is in comparison with England and Scotland—went to the war

Medical News.

SOCIETY OF APOTHECARIES OF LONDON—At examinations held recently the following candidates passed in the subjects indicated

Surgery—J L D Buxton (Sections I and II), University College Hospital and S G Mahomed Liverpool

Medicine—G S Ashby (Sections I and II) King's College Hospital J Bebesnillan (Section I) and C G Bunn (Section I) Charing Cross Hospital B F Deacon (Section I), Guy's Hospital F C M Gabites (Sections I and II), Edinburgh I Liberman (Sections I and II), Leeds A G Curzon Miller (Section I) Middlesex Hospital; and L. Zarchi (Section I) Petrograd and Royal Free Hospital

Forensic Medicine—B A M Henderson Manchester and Charing Cross Hospital I Liberman Leeds and G L Mitchell Glasgow and Birmingham

Midwifery—D A. Dyer St. George's Hospital, B A M Henderson Manchester and Charing Cross Hospital I Liberman, Leeds and J Stephen Manchester

The Diploma of the Society was granted to the following candidates entitling them to practise medicine surgery and midwifery W Fletcher Barrett, St George's Hospital; C A W Chapman Sheffield D C Clark King's College Hospital E W Diggett, Jefferson College, Philadelphia A Selby Green Middlesex Hospital, D B Hearn Durham E J G Sargent St. Bartholomew's Hospital C Segal, Berne and Birmingham and ~~J R Sharp London Hospital~~

ROYAL MEDICAL BENEVOLENT FUND—At the last meeting of the committee, held on August 14th, 29 cases were considered and £306 voted to 25 of the applicants The following is a summary of some of the cases relieved —

Widow aged 69 of L.R C.P Edin who practised at High Wycombe and Holt and died in June 1917 and was an annuitant of the Fund Applicant's only income is £1 per week and owing to the long illness of her husband requiring constant nursing her health is undermined and she requires a change Voted £10 in two instalments.—M.D Lond. aged 50 who practised in London and Perth, South Australia. Applicant has suffered from paralysis for the last ten years His wife is in a home and her income is only sufficient for herself and for the education of the two children ages 16 and 17 Applicant's income £50 a year which he finds insufficient owing to the increased cost of food Voted £26 in 12 instalments—Daughter, aged 36 of M.R.C S Eng who died in 1887 Applicant has had to look after her mother who has recently died, and her income was only a life annuity so the daughter is left entirely without means and now wants help to be trained for secretarial work Voted £10—Children twins aged 5 years, of an M D Edin. who died in 1916, and the mother in 1914 There is also a boy aged 7, but the grandmother has adopted him Help is required towards the keep of the twins who are at present with an uncle who cannot afford to keep them Voted £12 in 12 instalments—Widow aged 39 of M B Edin who practised in South Africa and was killed in action in September 1916 He came over to England soon after the war commenced hoping to be able to join the R A.M.C or the Red Cross Society but had to wait so long that he joined a London Regiment as a private He left his wife and two children ages 8 and 9 in South Africa With the exception of what she can earn (at present is acting as temporary housekeeper) her only income is 18s 6d per week pension She wants some help towards the education of the children. Voted £20—M R C S Eng a widower aged 72, who practised at Stoke Newington and Ealing Suffers greatly from bronchitis and some time ago fractured his femur and has lost the use of his legs Only income £30 a year from investments Has two sons unable to help and lives with a married daughter whose husband is in the Army Voted £26 in 12 instalments—Widow aged 62, of M.B Edin who practised at Brighton and died in April 1917 at the age of 58, after a long illness which prevented him from saving Applicant's only income about £50 a year from investments. Has two daughters both living at home one a typist and the other a violinist, neither of whom is earning much One son married and is in the Army Relatives help to pay the rent Voted £11—L.R C P & S Glasg married aged 44 who practised at Brighton Is suffering from tuberculosis and is at present in a sanatorium Has had nine years illness and his savings are exhausted His wife has just commenced a business but is unable to help Voted £26 in 12 instalments—Daughters ages 58 and 60 of M D Aberd who practised at Luddenden and died in 1907 Both suffer from chronic deafness and ill health Only income £20 each from dividends Relieved four times £56 Voted £18 in 12 instalments.—Daughter aged 36 of M D Dub who practised at Hillingdon and British Guiana and died in 1824 Applicant suffers from tuberculous glands and is unable to work She lives with her stepmother who is badly off Relieved nine times, £100 Voted £10 in two instalments—Widow aged 60 of L.R.C P & S Glasg who practised at Walsall and died in 1902 Applicant was left totally unprovided for at husband's death with daughters to educate They are both earning a little now but not sufficient to enable them all to live without help Applicant earns a little by needlework. Relieved 11 times, £118. Voted £12 in 12 instalments—Daughter aged 67 of M R.C S Eng who practised at Liverpool and died in 1851 Applicant lost all her property in an Australian bank failure She has very bad health and is entirely dependent upon friends for support. Relieved four times £18. Voted £12 in 12 instalments—Widow aged 60 of M R C S Eng who practised at Bawtry and died in 1906. Applicant's health is very bad and she has undergone several operations Only certain income £22 from dividends Has one daughter who is at the Drapers Company School Brother helps with the rent. Relieved once £10 Voted £10 in two instalments—Widow aged 63 of L R C P & S Edin who practised at Blackpool and died in 1912. Applicant was left without means and tried to earn a living by keeping a boarding house but owing to ill health was compelled to give it up, and has the house on her hands until September Only income £30 a year from a friend Relieved once, £5 Voted £5.—Daughter aged 62, of M R C S Eng who practised at Kingscliffe and died in 1890. Applicant's income from dividends is £21 She earns £14 a year as a companion Health very unsatisfactory Relieved twice £14 Voted £9 in 12 instalments

—Daughter aged 55 of M R C S Eng who practised at Kingscliffe and died in 1690. Cumberland County of —Female Assistant Medical Officer Salary £350 per annum lation exceeding 4 000 000 persons, the death rate was 10·7, or 0 4 per 1000 above that recorded in the previous week among the remaining towns the death rates ranged from 3 2 in Ealing 5 0 in Cambridge and 5 5 in *Edmonton to 19 7 in Southend-on Sea* 20 3 in Huddersfield, and 21 1 in Dewsbury The principal epidemic diseases caused 338 deaths, which corresponded to an annual rate of 1 0 per 1000, and included 200 from infantile diarrhœa, 55 from measles 34 from whooping-cough, 28 from diphtheria, 11 from scarlet fever, 9 from enteric fever and 1 from small pox The deaths from diarrhœa, which had increased from 53 to 180 in the four preceding weeks further rose to 200, and included 60 in London 21 in Liverpool 11 in *West Ham and 9 each in Manchester* and *Leeds* The fatal case of small pox belonged to Smethwick The 627 cases of scarlet fever and 1062 of diphtheria under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital were respectively 6 and 9 below the numbers remaining at the end of the previous week. Of the 3412 deaths from all causes in the 96 towns 144 resulted from violence The causes of 37 deaths were uncertified, of which 4 were recorded in Stoke-on Trent in Birmingham and in Liverpool, and 3 in *Leicester but not one in London*

Scotch Towns —In the 16 largest Scotch towns, with an aggregate population estimated at 2,500 000 persons, the annual death rate was 11·7 against 10 8 and 11 2 per 1000 in the two preceding weeks The 269 deaths in Glasgow corresponded to an annual rate of 12 6 per 1000, and included 29 from infantile diarrhœa 8 from whooping cough 2 from measles and 1 from diphtheria The 88 deaths in Edinburgh were equal to a rate of 13 8 per 1000, and included 2 from diphtheria and 1 from whooping cough

Irish Towns —The 108 deaths in Dublin corresponded to an annual rate of 14 1 per 1000 and included 22 from infantile diarrhœa and 1 from diphtheria. The 85 deaths in Belfast were equal to a rate of 11 3 per 1000, and included 5 from infantile diarrhœa and 1 from *whooping-cough*

(Week ended August 25th, 1917)

English and Welsh Towns —In the 96 English and Welsh towns, with an aggregate civil population estimated at nearly 17 000 000 persons, the annual rate of mortality was 10 6, against 10 3 10 4, and 10 5 per 1000 in the three preceding weeks In London, with a population exceeding 4,000 000 persons the death rate was 10 5 or 0·2 per 1000 less than in the previous week among the remaining towns the *death rates ranged from 3 8 in Wimbledon 4 5 in Eastbourne, and* 5 2 in Carlisle, to 16 9 in York 17 3 in Tynemouth, and 20·9 in Stockton on Tees The principal epidemic diseases caused 411 deaths which corresponded to an annual rate of 1 3 per 1000 and included 274 from infantile diarrhœa, 66 from measles 30 from whooping-cough, 27 from diphtheria, 10 from enteric fever and 4 from scarlet fever The deaths from diarrhœa, which had increased from 53 to 200 in the five preceding weeks further rose to 274 and included 72 in London, 40 in *Liverpool 22 in Manchester and 16 in Leeds The 614 cases of* scarlet fever and 1063 of diphtheria under treatment in the Metropolitan Asylums Hospitals and the London Fever Hospital were respectively 13 below and 1 above the numbers remaining at the end of the previous week *Of the 3463 deaths from* all causes in the 96 towns, 135 resulted from violence The causes of 23 deaths were uncertified and included 6 in Birmingham, 3 in Liverpool, and 2 each in Stoke-on Trent and Manchester

Scotch Towns —In the 16 largest Scotch towns, with an aggregate population estimated at nearly 2,500 000 persons, the annual death rate was 10 3 against 11 2 and 11 7 per 1000 in the two preceding weeks The 245 deaths in Glasgow corresponded to an annual rate of 11 4 per 1000, and included 32 from infantile diarrhœa 9 from whooping cough, 5 from measles and 2 from diphtheria. The 46 deaths in Edinburgh were equal to a rate of 7 2 per 1000 and included 1 from scarlet fever

Irish Towns —The 149 deaths in Dublin corresponded to an annual rate of 19 5 or 4 4 per 1000 above that recorded in the previous week and included 38 from infantile diarrhœa and 1 each from enteric fever whooping cough, and diphtheria. The 87 deaths in Belfast were equal to a rate of 11 5 per 1000 and included 7 from infantile diarrhœa

---

Irish Vital Statistics for 1916 —During 1916 *the marriage rate* in Ireland (5 45 marriages per 1000 of the population) was 0 44 per 1000 under that for 1915 and 0 11 under the average for the 10 years 1906–15 The birth rate (21 1 per 1000 of the population) was 0·9 per 1000 under the rate *for 1915 and 1 9 under* the average for the 10 years 1906–15, and is the lowest ever recorded in Ireland The death rate was 16 46 per 1000, being 1 10 under the rate for 1915 and 0 55 under the average for the 10 years 1906–15 With the exception of the rate for 1912, which was 16 45, and that for 1914 (16 28), the death rate is the lowest since 1871 Turning to tuberculosis, the death rate was for all forms of the disease 2 15 per 1000 With the exception of 1912 (in which the rate was also 2 15), 1913 (2 14), and 1914 (2·07), the rate for 1916 was the lowest recorded in Ireland, but there is little to boast of when we consider that in the same year in England and Wales the mortality rate from consumption in all its types was 1 53 per 1000 and in Scotland 1 59 The infantile mortality was in Ireland during 1916 83 per 1000 births, being 9 under the rate (that is, per 1000 births) for 1915, and also 9 under the average for the 10 years' period 1906–15 The rate, it is satisfac[illegible] is the lowest yet recorded The satisfact[illegible] the vital statistics for 1916 in Irelan[illegible] *To the Editor* rate generally the fall in the tuberc[illegible] leading article the slight improvement in the annual[illegible] is, but it is most extraordinary to find t[illegible] portance of all countries—there was during 1916 the low[illegible] when dise yet recorded, and that never were there so few[illegible] imports in Ireland as in 1916, notwithstanding that[illegible] anye ever remembers the country so prosperous, and[illegible], owing to the absence of compulsory service, so few m[illegible]—that is in comparison with England and Scotland—went to the war

The Chief Inspector of Factories Home Office, London, S W, gives notice of vacancies for Certifying Surgeons under the Factory and Workshop Acts at Radcliffe (Nottingham) Burton Latimer (Northampton) Pangbourne (Berks) and Whitehaven (Cumberland)

Births, Marriages, and Deaths.

BIRTHS

Back —On August 23rd at Queen Anne-street Cavendish square the wife of Ivor Back, F.R C S Captain R A.M C T of a son

Bainbridge.—On August 21st, at Tregantle Torquay the wife of Surgeon Charles Frederick Bainbridge, R.N of a daughter

Crichton Miller —At Bowden House Harrow-on the-Hill on August 27th the wife of H Crichton Miller M.D of 114a Harley street, of a daughter

Harold —On August 22nd at Brunswick-square W C the wife of James Harold L R C P I L.M of a son

Roderick —On August 22nd at Trumpington street, Cambridge the wife of Lieutenant-Colonel Henry Buckley Roderick, M C M.D, R A.M.C of twin sons

MARRIAGES

Bell—Ramsbotham —On August 27th at The Charterhouse, London John Henry Montgomerie Bell M D Edin F R.C S Edin Captain C A M C to Frances Jane daughter of the late S H Ramsbotham M D of Leeds

Grant—Minikin —On August 16th in Edinburgh Captain John Victor Livingstone Grant M.B, Ch B Edin. R A.M.C to Ida Mary daughter of the late Mr and Mrs Minikin of Horsforth

Murray—Beart —On August 23rd at St George's Hanover-square London James Elliot Murray M.D Edin of Shanghai China to Jocelyn Frances younger daughter of Montague Beart of Sawbridgeworth Herts (late of China and Japan)

Perrin—Preston —On August 22nd at the Parish Church Weybridge Maurice Nasmith Perrin B C Camb Captain R A M C to Susan Frances youngest daughter of Mr and Mrs Walter Preston of Curlew Hope Weybridge

Pracy—Power.—On August 24th at St Mary's Atherstone Captain Douglas Sherrin Pracy R A.M C M.R C S Eng L R.C P Lond. to Gwendoline Blanche elder daughter of Dr E T Power Atherstone

DEATHS

Ackroyd —On August 11th killed in action Captain Harold Ackroyd M.C R.A.M C

Armitage.—On July 30th whilst attending the wounded, Captain *Frank Rhodes Armitage*, M B D S O R F A aged 34

Bostock —On August 17th at Portman mansions W Surgeon Captain R Ashton Bostock Scots Guards of Penmaen Glamorgan

Metcalfe.—On August 24th at 1 Freeman-street Skelmersdale Lancs George Metcalfe M D M B B S, L R C P M.R C S, aged 54

Seward —On August 16th at Ashley House, Ryde I W, George Edwin Seward Retired Brigade Surgeon, Indian Army in his 91st year

Symons —On August 25th William Henry Symons M D Brux D P H Durh Major R.A M C T of Combe Park Bath aged 62

Taylor —On August 25th at Bexhill on Sea, Henry Young Cameron Taylor M B C.M F R C S Edin Captain R A.M C

Treherne.—On August 12th of wounds received in action Captain Claude William Treherne R A M C, aged 29

N.B —A fee of 5s is charged for the insertion of Notices of Births Marriages and Deaths

Notes, Short Comments, and Answers to Correspondents.

THE CAUSATION OF SEX

To the Editor of The Lancet

Sir,—Although no one has, up to the present, settled the question when and where in the course of development of the embryo sex is determined, I think it illogical to attribute it merely to that stage when sexual differentiation takes place, and that therefore this factor may be safely eliminated from the field of investigation Sexual differentiation similar to that of any other part of the entire organism, occurs in due time, but the determination of sex is established at the moment of fertilisation of the ovum, when also the potential development of any other part of the whole is present in the fertilised cell The settlement of the sexes at this crucial point is, however, only the result of the condition of the spermatozoa and ova before fertilisation, and this condition appears to me to be the true cause of sex.

In previous publications I have stated the results of my observations in 1500 maternity cases, and I am now preparing new tables for further observations based on those results which I hope to publish in due course As I have stated before, my experience does not agree with any of the various views of previous observers, except perhaps that of Weill, mentioned by your correspondent Dr Leonard J Kidd in The Lancet of August 18th, but Weill does not define the activities of the spermatozoa or ova at the time of fertilisation I am, Sir, yours faithfully,

A P Murtz

Queen's-road, N, August 20th 1917

THE FACTORY GIRLS' COUNTRY HOLIDAY FUND

Mr Pett Ridge makes an earnest appeal for support in the annual report of the executive committee of this fund "Throughout the year girls and women whose health made a change and rest absolutely imperative have been sent away, and it is clear that under the stress of war holidays have been more needed than ever by the poorer class of worker The committee of the fund has been faced with great difficulty both in finding the necessary money and in selecting the women who need the holidays most At the present time the cost of a holiday is more than double the sum it was in normal years For this reason the committee's appeal for funds to supplement the amount the girls and women can pay has to be more urgent than ever Subscriptions and donations will be most thankfully received and acknowledged by Miss Canney, 75, Lamb's Conduit-street, London, W C 1

FIRST AID

A new and revised edition of the excellent little manual "Aid to the Injured and Sick," by Henry Willingham Gell, M B Oxon, published under the auspices of the National Health Society, 53, Berners-street, W, price *3d*, has just been issued Its purpose is to supply in the form of a text book, at a price within the means of the poorer members of the community the information necessary for assistance in emergencies till the doctor comes" To achieve this object much condensation has, of course, been necessary, but clearness has not thereby been sacrificed, and the fact that the little book has gone through 39 editions in 25 years is an indication of its popularity and usefulness The nine chapters into which the 40 pages of the book are divided deal with anatomy and physiology, wounds, hæmorrhages, fractures, dislocations and strains, bruises burns, stings and poisons, insensibility, drowning hanging, suffocation and electric shock, bandaging and the carriage of patients

PORTLAND CEMENT IN THE DRESSING OF WOUNDS

To the Editor of The Lancet

Sir —Having been in the habit of using small packets of Portland cement for many years for small household repairs, I have noticed its peculiar effects on the fingers if in its moistened state it is allowed to adhere to them for half an hour or so It blanches and shrivels the fingers, and bores pin holes in the tips especially, which tingle until ointment is applied The faculty of boring these pin holes particularly interested me, and I had often wondered what the effect would be if Portland cement were applied to a large wound Several years ago I have a recollection that I read a letter somewhere from a medical man I think who said he had used it in the treatment of wounds, whether plain or mixed with some other substance, possibly sugar, I cannot quite recall I have many times tried to find the letter again by means of indexes but have not discovered it I have also looked in books published upon the uses of concrete and Portland cement but have found no mention there of the use of Portland cement in wounds I have an impression that it was in THE LANCET that I saw the note but cannot be certain I have been thinking that perhaps the idea might again turn up in this war, but it has not up to now, so far as I know. Perhaps some of your readers may know of this scouring treatment of wounds.

I am, Sir, yours faithfully,
DOMESTICUS
London, August 24th. 1917

A SIMPLE METHOD OF DETECTING SIMULATED DEAFNESS

MEDICAL Boards not infrequently meet with men who state that they are "hard of hearing" in one or both ears, and in a number of these cases the examiner suspects malingering, or at least an exaggeration of their deafness Dr John J Eyre has written to us describing a method of detecting simulation which he has found of practical service as a member of the Shoreditch Medical Board and is not contained in the standard works on malingering. The usual tests, such as the watch and the tuning-fork, take time and are open to objection, as they depend upon the statement of the subject as to whether he can hear them or not It occurred to him that the involuntary blinking of the eye might be used as a test applied in the following way The recruit who stated that he was very hard of hearing, was first asked which ear was the deafer and then requested to close it with the index finger of the hand of the same side Standing on the opposite side, with his face 6–8 inches away from the ear, and after pretending to examine the ear for a few seconds, Dr Eyre then whispered suddenly "Shut your eyes." Before the recruit could take thought he closed his eyes and revealed the fact that he was a malingerer. Dr Eyre suggests that this method may also be employed as a rough-and-ready test for varying degrees of deafness the voice being gradually raised or the mouth brought nearer to the ear of the subject until the eye reflex is obtained

ESPERANTO AND THE WAR.

Mr Bernard Long, of 1, Cromwell road, Basingstoke, the author has sent us a pamphlet, *Esperanto and Why We Need It*, in which he makes out a good case for this auxiliary language Mr Long sets out the history of Esperanto and the uses to which it has been put socially and commercially and notes the support that it has received from Government departments and other important bodies throughout the world The adaptability of Esperanto to scientific use has led to the formation of an Esperanto group of medical men, the Tutmonda Esperantista Kuracista Asocio which up to the beginning of the war had its own journalistic organ *La Kuracisto* It is of interest to note that the study of the language has been the means of somewhat ameliorating the conditions of prisoners in internment camps, and in some cases, we are told, Flemish- and French-speaking Belgians are now for the first time able to converse together by means of Esperanto which they learned in the camp classes The pamphlet price 2*d*, can be obtained from the British Esperanto Association, 17, Hart street W C 1.

EDITORIAL NOTICES

IT is most important that communications relating to the Editorial business of THE LANCET should be addressed *exclusively* "TO THE EDITOR," and not in any case to any gentleman who may be supposed to be connected with the Editorial staff It is urgently necessary that attention should be given to this notice

It is especially requested that early intelligence of local events having a medical interest, or which it is desirable to bring under the notice of the profession, may be sent direct to this office.

Lectures, original articles, and reports should be written on one side of the paper only, *and when accompanied by blocks it is requested that the name of the author, and if possible of the article, should be written on the blocks to facilitate identification*

Letters whether intended for insertion or for private information, must be authenticated by the names and addresses of their writers—not necessarily for publication

We cannot prescribe or recommend practitioners.

Local papers containing reports or news paragraphs should be marked and addressed "To the Sub-Editor"

Letters relating to the publication, sale, and advertising departments of THE LANCET should be addressed "To the Manager"

We cannot undertake to return MSS not used.

Offices 423, STRAND, LONDON W C. 2.

MANAGER'S NOTICES

VOLUMES AND CASES

VOLUMES for the first half of the year 1917 are now ready Bound in cloth, gilt lettered, price 21*s*., carriage extra

Cases for binding the half year's numbers (inland edition) are also ready Cloth, gilt lettered, price 2*s* 6*d*, by post 2*s* 10*d*

To be obtained on application to the Manager, accompanied by remittance

TO SUBSCRIBERS.

WILL Subscribers please note that only those subscriptions which are sent direct to the Proprietors of THE LANCET at their Offices, 423 Strand, London, W C. 2, are dealt with by them? Subscriptions paid to London or to local newsagents (with none of whom have the Proprietors any connexion whatever) do not reach THE LANCET Offices, and consequently inquiries concerning missing copies, &c., should be sent to the Agent to whom the subscription is paid, and *not* to THE LANCET Offices.

Subscribers, by sending their subscriptions direct to THE LANCET Offices will ensure regularity in the despatch of their Journals and an earlier delivery than the majority of Agents are able to effect

THE COLONIAL AND FOREIGN EDITION is published in time to catch the weekly Friday mails to all parts of the world.

TO COLONIAL AND FOREIGN SUBSCRIBERS

Subscribers abroad are particularly requested to note the rates of subscriptions given on page 4

The Manager will be pleased to forward copies direct from the Offices to places abroad at the rates shown, whatever be the weight of any of the copies so supplied.

NEWSPAPERS FOR NEUTRAL COUNTRIES.

Newspapers are not at present being sent forward to neutral European countries unless posted direct from the office of publishers or newsagents who have obtained permission from the War Office for this purpose The Publisher of THE LANCET has obtained the required permission and he will forward copies direct from the Office to any neutral country on receipt of instructions

SOME
Statistical Results
OF THE
TREATMENT OF CHEST WOUNDS

BY T R ELLIOTT, F R C P LOND, F R S,
LIEUTENANT COLONEL, R A M C.

THE figures analysed in the first part of this paper are based upon the after histories in the United Kingdom of 170 cases of chest wound which, when seen by the writer at a base hospital in France during the first two years of the war presented various points of clinical interest and were therefore made the object of later inquiry The figures are incomplete, because they omit not only those that died at the base hospital, but also a large number of uneventful cases whose later history was not ascertained They do not in any way represent the proportionate incidence of the various complications of a chest wound but they are sufficiently comprehensive to be used for answering some of the main questions with regard to the convalescence of survivors from chest wounds Fuller and more detailed information upon the various points in the after history of such wounds will not be available for the guidance of surgeons in the field until workers in England publish the fruits of their more careful inquiries in home hospitals

For the returns that are here reviewed, the writer is indebted to the courtesy of many medical officers at home who have generously supplied the information asked for in the schedules issued by the Medical Research Committee This information, in respect of many of the cases, unfortunately ends at the date in the clinical history when the patient was discharged from hospital, and a statement of "fit for duty" may mean no more than that the convalescent was classified as such by the estimate of the medical board A statement of "fair result" indicates that convalescence had passed beyond all the lingering steps where a set-back might be apprehended, but that it had not yet ended in discharge from hospital The majority of such cases might be looked upon as probably fit for duty in a little longer time, and indeed, it will be observed in the subsequent tables of data that most of these returns of "fair result" were made in the second or third month after the wound—that is, at a date when it was naturally too early to expect that the case would have been finally disposed of

Dr Matthew Young, of the Statistical Department of the Medical Research Committee, gave most valuable assistance at this point, and traced 75 out of the total 170 beyond hospital to the duty which they were actually found to be capable of performing in the Army, or to their final discharge as unfit For the rest of the cases Army records were not completely available at the time when this paper was written, and more time must elapse before these ultimate data can be collected

An impression has been gaining ground, in the French service at any rate that chest wounds are more fatal than was at first supposed Whatever their mortality may be, it is certain that the deaths almost all occur in the first month, and that beyond this date the injury is neither of a fatal nor of a disabling character A chest wound may invalid a soldier for two or three months if it is simple or for any time up to a year if it has been accompanied by a large or by an infected effusion into the pleural cavity But the ultimate recovery is very good and relatively few of the survivors from such wounds need to be invalided out of the Army

The periods of invalidism may be considered with reference to the occurrence of a sterile hæmothorax whether aspirated or otherwise, of empyema of pneumothorax and of lung laceration And each of these groups will require further analysis in respect of the nature of the original wound, as to whether it was caused by rifle bullet or by shell and whether the projectile was or was not retained in the body The clinical groupings rest upon an examination of each case made in France during the first and second week after the wound at a time that is when the immediate results of the injury could be easily and completely identified Owing to pressure of general work it was often impossible to ask for an accurate localisation of such projectiles as were retained in the thorax, and the statement of a foreign body being retained refers only to retention anywhere within the thorax in a position where it lay too deep to be felt by the fingers

The patients were transferred to England in the third week after the wound, or a week or two later if an empyema had been drained by rib resection The returns from home hospitals show that after this time it was very rare for any further intervention to be found necessary There was never any fresh effusion that required aspiration Sepsis developed in only three of the cases that were supposed to be sterile when they left France, and these were all examples of solidly clotted hæmothorax with retained projectiles Necrosing fragments of rib had to be removed in a few cases, and there were two minor Estländer operations on old empyemata Retained foreign bodies were rarely interfered with, and there was no history of their having led later to any characteristic troubles There were no deaths in the United Kingdom, excepting a single case where an operation undertaken at the patient's request for the removal of a bullet was followed by a fatal pneumonia

The number of cases, totalling 170, whose after-history in the United Kingdom was traced consisted of the following groups —

Sterile hæmothorax	89
Septic effusion	64
Clotted hæmothorax, later septic	3
Sterile pneumothorax	6
Severe laceration of lung	2
No effusion	6

LACERATION OF THE LUNG

It is difficult to select cases which will illustrate the recovery of a lacerated wound in lung tissue, because this condition is usually associated with the development of complicating factors, such as a hæmothorax.

An outstanding example may be quoted The man was wounded by a bullet through the upper right chest The entrance and exit wounds were large, offensive pus poured freely from both of them, and the track communicated with the bronchus X rays showed a large tunnel blown clean through the lung, giving the appearance of a tuberculous cavity The lung was everywhere in contact with the parietal pleura After a period of dangerous sepsis the patient recovered rapidly, and in four and a half months he was back on duty in France A similar case caused by a shrapnel ball had also healed soundly in five months,

Two examples of septic hæmothorax (anaerobe bacilli with streptococci), which were coughing up foul hæmothorax fluid in great abundance recovered so rapidly after rib resection that they had rejoined for duty three and four months respectively after their wounds Yet in these the lung must have been freely lacerated Indeed, most lung wounds in this war are accompanied by laceration of greater or less degree, and yet the after history of the hæmothorax cases in general fails to afford any indication that lung laceration needs to be reckoned with as a factor delaying convalescence

The general conclusion to be drawn from this evidence is that laceration of the lung tissues is as readily repaired as it is easily inflicted Insomuch as it is a vascular sponge, the lung is very tolerant of such injury, and scar tissue quickly closes up the defect Pneumonic inflammation, or gangrene does not spread from the neighbourhood of the track, and even if the latter be septic, extending ulceration and secondary hæmorrhage are rarely to be feared provided that the wound in the lung be given free outward drainage The influence of a foreign body retained in lung tissue is considered in a later section

PNEUMOTHORAX

A pure exogenous pneumothorax, in which air has escaped freely into the pleural cavity and yet the leak has [illegible] accompanied by intrapleural hæmorrhage, is relatively rare, though not so uncommon as might have been expected from the fact that most of the wounds causing this condition have passed through the hilum of the lung

Six cases appear in this group, of which three were examples of full pneumothorax with complete collapse of the lung, while in the other three the lung was only half collapsed, though it was everywhere separated by free air from the parietal pleura There was neither free blood nor serous effusion in the pleural cavity The clinical diagnosis was in each case confirmed by the X rays In only one of the six did it appear probable that the air had entered through the wound in the thoracic wall

Only three of the cases were aspirated, with partial replacement of the air by oxygen on the thirteenth, nineteenth, and twentieth days respectively Two others had a shrapnel ball and a shell fragment respectively retained in the chest, and these were not interfered with

The result was that within two months of the wound all of the cases were free from any evidence of chest trouble, and three had already been discharged as fit for duty The cases that were not aspirated had attained ultimate convalescence as rapidly as those which were aspirated The latter treatment is therefore unnecessary, though it may be used in the second week to lessen discomfort and dyspnœa if the patient complains of the latter Such aspiration has never in my experience led to any ill consequences

From these results it is evident that a simple traumatic pneumothorax is a very benign condition It is not likely to be followed by the later development of sepsis nor of a serous effusion The diaphragm soon commences to move again on the injured side There are none of the crippling restrictions to respiratory movements that usually persist with a lung that has collapsed beneath clotting blood, and expansion follows absorption of the air so rapidly that such casualties become fit for duty at fully as early a date as do others with simple through and through wounds of the lungs which were not complicated either by air leak or by internal hæmorrhage

STERILE HÆMOTHORAX.

The evidence with regard to this group is incomplete in two respects Since the smaller collections of fluid were looked upon as being of little interest, no attempt, as a rule, was made to trace their subsequent history, and therefore few of them appear in the table Also, the largest effusions in this series were almost without exception emptied by aspiration in France, so that it is, unfortunately, impossible for me to quote cases from my own experience which would illustrate the after history of a large non aspirated hæmothorax in contrast with that of a similar condition treated by relatively early aspiration

STERILE HÆMOTHORAX ASPIRATED

The aspiration was generally performed on some day from the sixth to the twelfth after the wound, and oxygen replacement was used so as to enable the fluid to be removed as completely as possible at a single operation Probably this was effected with fair success, and little was left behind except a collection of blood clot which varied in amount from case to case in correspondence with the individual conditions of clotting in each

A second aspiration was very rarely needed in France, and it never produced more than 10 oz of fluid in any case Only two of the cases were aspirated again in England, and one of them yielded only 2½ oz (after 63 oz. in France), and the other 12 oz (after 70 oz. in France) Therefore it appears to be certain that a fresh accumulation of fluid, whether of blood or of pleural effusion, does not develop to any appreciable extent in sterile cases after the first complete aspiration

The subsequent histories in England were obtained for a total of 67 aspirated cases The details are given in the following tables The statement that a man was sent to "furlough," or showed a "fair result" within three months, gives a strong probability that he would shortly be fit for duty, but in these cases the after history could not be traced further The figures in brackets for every group give the total numbers of months of invalidism for each patient before he was returned as fit for duty or otherwise reported upon Thus 3 (4, 4, *6*) indicates that the 3 patients were marked for duty at the 4th, 4th, and 6th month respectively after their wounds A figure in *italic* indicates that in this case the projectile was retained—for example, the case discharged at the sixth month in the instance just quoted

Aspiration never caused any trouble or evidence of recurrent hæmorrhage, and not a single one of the cases so treated developed infection later in England. In some cases it was [illegible] by most satisfactory results, so that several cases of [illegible] effusion were thereby got back to duty at almost as [illegible]rly a date as a man with no hæmothorax at all

Thus one case, 60 oz removed at one aspiration (shell retained), was back on duty in France 2½ months after his wound, and another of 64 oz was on light duty at the end of one month One officer, from whom 62 oz. had been removed, was met by me six months later in France, and he stated that his wind was as good as it had ever been in his life

But despite these favourable cases, it will be evident from the tables that examples of large hæmothorax, on the whole, took longer to get back to duty than did the smaller effusions, and that the time of invalidism was progressively less prolonged in proportion as the original effusion was of smaller size

The time of return to duty varied widely in the limits of each of the three groups This difference may have been due to varying amounts of residual blood clot, or to different standards of treatment by physical exercise at the various home hospitals at which they were received The character of the wound in the thoracic wall would also affect the individual result It should be noted that the retention of a foreign body did not seem to influence the time of return to duty

There did not appear to be any clear difference in times of invalidism between those who were aspirated in the second and those in the third week after the wound Certain cases that had been aspirated by Captain S R Armstrong, R A M C, at an earlier date, on the third or fourth day, and came under my observation subsequently, seemed from their physical signs to be likely to give better results than those quoted in the following returns But in these cases the complete history is lacking, so there is no actual proof of the probable advantage of a very early aspiration

TABLE I —*Sterile Hæmothorax Aspirated (Total 67 Cases)*

Large hæmothorax 60 to 90 oz. of fluid (1700 c.c. to 2500 c c) removed at a single aspiration

30 cases: 18 caused by bullet, 2 being retained
12 „ shell, 7 „

—	In 3 months or less	After 3 months	Total.
To duty	6 (1, 2, 2½, 2½, 3, 3)	11 (4 *5* 6, 6, 7 7 8, 8 *9 11 15*, the last 4 being in France at that time)	17
To furlough	3 (1 2, 2)	—	3
Fair result	9 (1, 1¼ *1¼* 1½ 1¾ 2¼, 2½ *2¾ 3*)	—	9
Unfit	—	1 (owing to paralysis of arm)	1

Medium-sized hæmothorax yielding from 35 to 60 oz. of fluid at a single aspiration

24 cases: 19 caused by bullet, *5* being retained
5 shell 1

—	In 3 months or less	After 3 months	Total
To duty	6 (1¼ *2 2½* 2½ 2½ 3)	*5 (4 4 5 5, 5)*	11
To furlough	3 (1¼ 1½ 2)	—	3
Fair result	8 (1 1¼ 1½ 1½ 1¼ *1½* 1¾ *2¼*)	—	8
Unfit	1 (succumbed to operation *1½*)	1 (*5* by traumatic neurasthenia)	2

Small hæmothorax yielding 20 to 30 oz. with a varying amount of residual clot.

13 cases 11 caused by bullet, 3 being retained
2 „ shell 1

—	In 3 months or less	After 3 months	Total.
To duty	5 (2, 2½ 3, 3 *3*)	3 (4, 4, 6) (all in France)	8
To furlough	1 (3)	—	1
Fair result	2 (1, 1½)	—	2
Unfit	—	2 (*7* from traumatic neurasthenia; *8* from paralysed arm)	2

LARGE *CLOTTED HÆMOTHORAX*

Three examples of this condition were traced In each of these aspiration had been attempted by me in France with a yield of only 10 to 20 oz., where at least 50 oz had been looked for The physical signs remained without change, and the patients were evacuated to England in the belief that the massive residuum of blood clot was sterile

All three were subsequently resected in home hospitals In each of them the projectile, one bullet and two shell, had been retained The results were —

2, shell retained, both resected for empyema (organism not stated), one discharged to duty in four months from wound, and one practically well at that time

1 bullet retained, resected and drained for "blood clot", discharged unfit at seventh month

It is paradoxically true that recovery of the chest from the crippling results of a large hæmothorax may be more rapid if sepsis occur than if the collection remains sterile, for the digestive processes of infection are able to discharge with great rapidity through a drainage opening the fibrinous masses of blood clot that otherwise might have continued to resist the expansion of the lung in its lower half

STERILE HÆMOTHORAX, NOT ASPIRATED

None of the 22 cases of hæmothorax which were not aspirated developed any further complications at home, and the small effusions were discharged for duty at about the third month The results were fully as good as those of any aspirated cases (Table II)

TABLE II —*Sterile Hæmothorax, not Aspirated (Total 22 Cases)*

Moderately small hæmothorax estimated at 20 to 40 oz with dullness extending well into the axilla.

11 cases 5 caused by bullet, 1 being retained.
6 „ shell 4 „ „

The retention of a shell fragment did not appear to influence the date of return to duty

—	3 months or less	After 3 months	Total
To duty	7 (1¼ 2 2, 2 2½ 3 3)	3 (*6* 6 7 One at 6 being a double hæmothorax One in France at *11*)	10
To furlough	1 (*5*)	—	1

Small hæmothorax not reaching into axilla
11 cases 9 caused by bullet 2 being retained
2 shell 2 „

—	3 months or less	After 3 months	Total
To duty	7 (1¼ 1½ *1¾* 2, 2, 2 *3*)	3 (*5* *6* 8 Two in France at eighth month)	10
Fair result	1	—	1

No hæmothorax The only uncomplicated cases were the two returned as "for duty and fair result" at three weeks the rest cannot be justly quoted in comparison

6 cases 3 caused by bullet, 2 being retained.
3 shell 1 „

—	3 months or less	After 3 months	Total
To duty	2 (*¾* *½)	1 (*5*)	3
Fair result	3 (1 *1¾* 2)	—	3

Therefore it is not necessary to aspirate small effusions of about 30 oz which extend half way into the axilla and do not cause much cardiac displacement Indeed the combined Tables III and IV of total results show a much more satisfactory recovery for the non aspirated than for the aspirated cases of hæmothorax, and might be quoted in respect of a routine policy of non interference But the comparison is unfair on account of the small size of the non aspirated effusions The large effusions that were aspirated gave tolerably good results At least 30 per cent of them were well again within three months So rapid a recovery could not have been attained without aspiration Medical officers in England have described the late results of a large non aspirated hæmothorax as being most unsatisfactory the lung remaining collapsed and the chest expanding very poorly My tables fail to bring out this type in contrast to the others because all the cases of large hæmothorax in this series were aspirated

Tables III and IV summarise the general results, and show that the recovery of a case of sterile hæmothorax was not influenced by the retention of a projectile

TABLE III —*Sterile Hæmothorax Aspirated Completely*

SEPTIC HÆMOTHORAX (64 CASES)

The original volume of blood in these varied greatly, and in a few there was probably no hæmothorax, but simply an infected pleural effusion The grouping of the cases is made according to the chief forms of infecting organisms. Actually this distinction has little value with regard to the total time of invalidism of a case after drainage It is true that the nature of the infecting organism is all important in a consideration of the mortality from the various forms of septic hæmothorax in the first two weeks But when once the danger to life has been averted by a satisfactory drainage of the pleural cavity all the infections soon assume a common character, and the mingled secondary growths on the suppurating pleura are probably much the same in all open empyemata

The period of convalescence will thenceforward be determined by the size of the cavity and by the nature of the collapse of the lung and the thickness of the fibrin coat overlying it The time must also vary considerably in relation to the skill and energy with which the empyema cavity was treated in the various hospitals in the United Kingdom where each patient was received, for it is certain that systematic breathing exercises combined with antiseptic lavage of the cavity will hasten the closure of the sinus Much depends, too on a proper placing of the original drainage opening and a satisfactory removal of carious ribs For these separate reasons the final figures must be considered only on a very broad average of the results that they show

The tables which follow are constructed upon a plan similar to that used for sterile hæmothorax, and retention of a projectile is indicated in the same way by a figure in *italic* An empyema of large size (estimated above 50 oz) is indicated by an asterisk to the figure of time of recovery for each individual case

The general times of recovery are fairly illustrated by the following case The patient was wounded in the right chest in 1915 and a sterile hæmothorax was aspirated In six months he was back on full duty in France and felt no disability In 1916 he was again wounded, this time in the left chest, and a large hæmothorax resulted which on [illegible] first aspiration yielded 80 oz freely infected with staphylococci After rib resection he was dangerously ill and semi delirious for a week, but in 2½ months the sinus was closed, and in six months he was again reported fit for duty in England.

EMPYEMATA

TABLE V —*Infections by Gas producing Anaerobic Bacilli only*

23 cases 6 caused by bullet 1 being retained
17 , shell 7 , ,

There was no obvious difference between early and late resections in respect of return to duty One patient, though infected, was treated by aspiration only in France, but he had to be resected in the United Kingdom, and was discharged unfit at the end of the fifth month It is difficult to estimate the influence of the size of the collection of fluid, because the ultimate pyo pneumothorax may be large when the original hæmothorax was small The retention of a shell fragment certainly had an unfavourable influence on return to duty

—	In 6 months or less	After 6 months	Total
Duty	8 (3*, 3*, 3, 3½ 4*, 5 5)	2 (12* 18)	10
Fair result (sinus closed)	4 (2½ 3*, 3*, 4*)	1 (7*)	5
Unfit	4 (4* 5* 6* 6*)	4 (4* from duty at 6*) 7 8* 12*)	8

TABLE VI —*Infections by Gas Bacilli Combined with Streptococci, &c*

9 cases 3 caused by bullet 0 being retained
6 , shell 3 , ,

These were chiefly resected in the second or third week

—	In 6 months or less	After 6 months	Total
Duty	1 (4)	3 (7 8* 8 of whom 2 in France at 11 and 12)	4
Fair result (sinus closed)	3 (2 3, 5)	—	3
Unfit	1 (6*)	1 (at 15 after light duty at 7	2

TABLE VII —*Infections by Streptococci and Staphylococci either Alone or Commingled*

These groups are thrown into a common table The separate results were —

Streptococci alone	7 cases :	2 fit for duty	4 unfit
Staphylococci alone	4 ,	2 , ,	2 ,
Strept. and staph mixed	5 ,	3 ,	2

There were two cases, afterwards classed as unfit, upon whom minor Estländer operations were performed

Total cases, 16 10 caused by bullet, 0 being retained
6 , shell, 3 , ,,

—	In 6 months or less	After 6 months	Total
Duty	6 (4½ 5*, 5 5½ 6*, 6*)	1 (10*)	7
Fair result (sinus closed)	—	1 (8)	1
Unfit	2 (4½* 5*)	6 (7, 9 9* 12 14 from Reserve Batt'n at 6 10 from light duty at 8)	8

TABLE VIII —*Infections by Pneumococci (8) and Influenza Bacilli (2)*

10 cases : 5 caused by bullet, 0 being retained
5 , shell 2

All the cases with large collections returned to duty one being back in France in the fifth month Late resections were fully as satisfactory as early ones

—	In 6 months or less	After 6 months	Total
Duty	2 (5* 5)	4 (7* 9 10 12* when in France)	6
Fair result (sinus closed)	2 (2½ 4)	1 (7 invalided by rheumatic fever)	3
Unfit	—	1 (7)	1

TABLE IX.—*Various Infections*

B coli, 2, Diphtheroid bacilli, 2, *B mycoides*, 1, a spirillum, 1 The case of *B mycoides* and one of the diphtheroid were resected later in the United Kingdom after the infection had been treated in France by aspiration only in the hope that it might subside

6 cases : 2 caused by bullet, 1 being retained
4 , shell, 3 , ,

—	In 6 months or less.	After 6 months	Total
Duty	1 (4*)	1 (8*)	2
Fair result (sinus closed)	3 (3, 4 4*)	—	3
Unfit	1 (6*)	—	1

The after results of the different infections are all combined in the next Table, No X The sinus had closed by the third or fourth month in a large proportion of the cases, and nearly one third were fit for duty in six months or less In the whole series there were only two cases in which a minor Estländer operation was performed in England None died But at least one third of the empyema cases had ultimately to be discharged as unfit simply on account of the chest condition, whereas there were none such in the sterile hæmothorax group

The original size of the empyema did not affect the ultimate classification of the convalescent as much as might have been expected About one half (31) of the 64 empyemata had been of large size—that is, roughly 50 oz or more, and about one half of the unfit and one half of those fit for duty were found to have belonged to the group of large empyemata. The large sterile hæmothorax got back to duty equally soon, whether caused by bullet or shell, and whether the projectile was or was not retained But a retained foreign body in the septic cases did cause unfitness Thus in the latter group —

For 44 projectiles not retained there were 9 unfit = 20%
, 20 , retained ,, 11 ,, = 55%

TABLE X —*Total Results of Empyemata (64 Cases)*

—	Bullet		Shell		Total
	Out.	Retained	Out	Retained	
Duty 6 months or less	9	—	6	3	18
After 6 months	4	1	4	2	11
Total for duty ..	13	1	10	5	29
Fair result (not finally classified)	4	—	8	3	15
Unfit..	6	1	3	10	20
Total	23	2	21	18	64

4 of those marked unfit were found to be so after several months of light duty, and 3 of these had retained shell fragments 7 cases were traced back to full duty in France within a year of their wounds, and 2 of these had had large empyemata

THE MORTALITY AMONG CHEST WOUNDS IN FRANCE

The figures that have been given in the preceding tables may be taken as a fair index of what is the after history of chest wounds that have survived to be sent across the Channel under the present established methods of treatment

During the last nine months, however, the opinion has been gaining ground that better results might be obtained by more active surgery undertaken as soon as possible after the wound was inflicted French surgeons have felt this strongly, and in order to accumulate such evidence as was needed for arriving at a decision on the matter the subject was formally inscribed on the order of the day of the French Society of Surgery on Nov 29th, 1916 Since that date numerous papers and important series of statistics bearing on the question have appeared in the weekly *Bulletins de la Société de Chirurgie de Paris** It is argued in these papers that the mortality from chest wounds is much higher than was at first supposed, and that this high mortality requires vigorous efforts on the part of surgeons to save life Also, in respect of casualties who *survive* these wounds, evidence is brought forward to show that retained projectiles and especially shell fragments, almost always cause trouble, either by the introduction of sepsis, *or*, if sterile, by the introduction of later pathological changes or symptoms that incapacitate the patient for service.

In consequence of these views it has been urged by several surgeons that the routine treatment of chest wounds should include —

1 The operative closure during the first 24 hours of all chest wounds that remain open with air suction (traumatopnœa) or free bleeding from within This surgery should be accompanied by a careful cleansing and closing of any wound in the lung as well as of the pleural cavity if any blood has been effused into the latter Drainage at an early date is to be avoided

2 The removal of all shell fragments, other than those of small size which are proved to be retained within the chest This should be done also in the first 24 hours and should be accompanied by a similar cleansing of the wound track, by suture of lacerated lung, and evacuation of the blood clot from the pleural cavity with subsequent closure of the incision in the thoracic wall in the hope that the development of sepsis will be thereby prevented

3 The removal from the thorax of all other retained foreign bodies at a much later date when the possibility of septic complications has passed away Duval's method of open operation and that of Petit de la Villeon (Jan 10th, 1917) have been freely used for this purpose and with complete success

Treatment on these lines would aim at saving lives that might be lost from primary hæmorrhage or from fulminating sepsis, and at lessening the periods of invalidism that result from the development of an empyema or from residual blood clot, and perhaps, too from retained projectiles in the chest

It has been fully demonstrated by such French surgeons as Pierre Duval, and independently by several surgeons in our medical service of whom Gask and Gray have been the pioneers that these thoracic operations are quite practicable under military conditions in the field. This in itself is a most important advance for it shows that the pleural cavity may be freely opened under ordinary local or general anæsthetics and the lung manipulated without any fear of immediate physiological disturbances Only it is essential that infection shall neither be spread broadcast by the operation nor introduced by drainage of the pleural cavity a the end of the operation. The procedure demands skill in execution as well as judgment in the choice of the case, and the results though often strikingly successful, are not always favourable For this reason it is desirable to test by general statistics the results of treatment by the earlier conservative policy and to see in what group of chest wounds it is reasonable to anticipate any improvement

Deaths after chest wounds are caused either by primary hæmorrhage or by infection in the chest or they may follow upon complicating wounds and in particular those of the abdomen or spine All deaths that occur from uncomplicated chest wounds in the first day may fairly be ascribed to primary hæmorrhage From the second day onwards it is infection that kills the man—infection either within the thorax or in other complicating wounds and especially those of the abdomen Pneumonia or purulent bronchitis is occasionally met with as a fatal factor in chest wounds

Hæmorrhage may be caused by any form of projectile, but sepsis is at least twice as frequent with wounds by shell fragment as with those by rifle bullets Statistics if complete, would therefore be required to show the cause of death in all fatal cases the proportion of septic cases among all chest wounds and the association of these particular consequences with the different types of projectile that had inflicted the wound and with the retention or otherwise of the foreign body In respect of sepsis it is also desirable to form a separate class of large open wounds in the chest wall through which there is free air suction and leakage of blood for these whether caused by bullet or shell are a particularly fatal group If full statistics of this nature were available it would be possible to determine the types of wound that ought in view of their peculiar fatality to be dealt with by immediate surgery in the first 24 hours after their infliction

Statistics as to Mortality of Chest Wounds

From the various statistics quoted by French observers Duval[1] took round figures suggesting that out of pure chest wounds that have survived to be carried off the field of battle there is a total mortality of more than 50 per cent when the deaths at successive medical units from front to rear are added together And Maisonnet asserted that very few of the survivors can return to full duty

Grégoire's figures (Feb 7th, 1917) for work at an Auto-chir, where the wounded men were kept under observation for three weeks, were more favourable than these general results In 404 cases of pure chest wounds there were 47 deaths—that is, 11 7 per cent , 57 cases, or 14 per cent , of the total were resected for empyemata, and of these there were 26, or 45 per cent , that died

The statistics given by Depage (Dec 20th 1916) from the special hospital at La Panne, where casualties are received from two to six hours after their occurrence and are detained until convalescence, are of particular value, because this arrangement enabled more complete records to be kept

In a series of 320 pure chest wounds there were 59 deaths—that is, 18·4 per cent Of these, 30 or 9 4 per cent of the total died in the first 24 hours—that is, from hæmorrhage and shock. The later deaths presumably from sepsis formed only 10 per cent of the total survivors Depage, in comment upon these relatively satisfactory figures, emphasises the fact that rather more than half of the casualties were caused by rifle bullet, and he gives the important analysis that the mortality of the latter was only 11 per cent , whereas it was 29 per cent with wounds by shell fragments

The figures of Depage approximate very closely to the generally favourable results that appear in the British Medical Service

For deaths from hæmorrhage and severe injury in our field ambulances no reliable figures have been collected

The returns for casualty clearing stations have in consequence not been adequately controlled by reference to the possibility of men with severe injuries being detained to die at medical units in front of the casualty clearing station level Sir Wilmot Herringham[2] observed at a casualty clearing station a series of 211 consecutive cases from the fighting on the Somme There were 22 deaths, but when fatal injuries of the spine and abdomen were excluded the mortality was only 7 3 per cent This figure is slightly less than the 10 per cent mortality quoted for two stations near the Ypres salient in the first year of the war

But later records from casualty clearing stations sited a little nearer the line which were not covered by retaining traps at the field ambulances in front of them have given a death percentage in pure chest wounds of about 20 Of these roughly one-half died at an early hour from severe injuries, while the remaining 10 per cent succumbed to septic complications Since death statistics of chest wounds have not been collected from the field ambulances for the earlier period when the severest cases tended to be retained at these front units it is impossible to decide whether the practice of passing chest wounds rapidly on to the casualty clearing stations may tend to increase their mortality The fact remains that under the non-operative method of treatment in vogue in the spring of 1917 the mortality at casualty clearing stations was about 20 per cent Very few die at field ambulances

The entire mortality in medical units in the Army area must therefore be rather less than 25 per cent In this reference it should be borne in mind that Depage's figures show that any total percentage of mortality is largely influenced by the nature of the fire to which the men have been exposed

From the base hospitals on lines of communication sufficient cases have been collected to give definite information The general mortality at the base to which chest wounds are transferred at a date from the third day onwards is well below 10 per cent and when complicating wounds are excluded it falls to about 5 per cent , the fatal factor in all these cases being sepsis But in that special group of chest wounds where sepsis develops the mortality is persistently high varying from 20 to 40 per cent [illegible] in accordance with the skill of treatment

The following analyses upon which these general statements are based were kindly given by Lieutenant-Colonel H Pinches and by Major W S Dickie, Major D H de Souza and Captain Fortescue Brickdale, from complete records supplied by the officers commanding each hospital

—	In 6 months or less	After 6 months	Total
Duty	1 (4)	3 (7 8* 8, of whom 2 in France at 11 and 12)	4
Fair result (sinus closed)	3 (*2*, 3, *5*)	—	3
Unfit	1 (6*)	1 (at *15* after light duty at *7*	2

TABLE VII —*Infections by Streptococci and Staphylococci either Alone or Commingled*

These groups are thrown into a common table The separate results were —

Streptococci alone ..	7 cases	2 fit for duty	4 unfit
Staphylococci alone	4	2 ,, ,	2 ,
Strept. and staph mixed	5 ,	3 ,	2

There were two cases, afterwards classed as unfit, upon whom minor Estländer operations were performed

Total cases 16 10 caused by bullet 0 being retained
6 ,, shell 3 ,,

—	In 6 months or less	After 6 months	Total
Duty	6 (4½ 5* *5* 5½ 6* 6*)	1 (10*)	7
Fair result (sinus closed)	—	1 (8)	1
Unfit	2 (4½* 6*)	6 (7 9 9* *12* 14 from Reserve Battn at 6 *16* from light duty at *8*)	8

TABLE VIII —*Infections by Pneumococci (8) and Influenza Bacilli (2)*

10 cases 5 caused by bullet, 0 being retained
5 shell 2 ,

All the cases with large collections returned to duty one being back in France in the fifth month Late resections were fully as satisfactory as early ones

—	In 6 months or less	After 6 months	Total
Duty	2 (5* 5)	4 (7* 9 *10* 12* when in France)	6
Fair result (sinus closed)	2 (2½ 4)	1 (7 invalided by rheumatic fever)	3
Unfit	—	1 (7)	1

TABLE IX.—*Various Infections*

B coli, 2, Diphtheroid bacilli, 2, *B mycoides*, 1, a spirillum, 1 The case of *B mycoides* and one of the diphtheroid were resected later in the United Kingdom after the infection had been treated in France by aspiration only in the hope that it might subside

6 cases : 2 caused by bullet, 1 being retained
4 ,, shell 3 ,

—	In 6 months or less.	After 6 months	Total
Duty	1 (*4**)	1 (*8**)	2
Fair result (sinus closed)	3 (3 4 *4**)	—	3
Unfit	1 (*6**)	—	1

The after results of the different infections are all combined in the next Table, No X The sinus had closed by the third or fourth month in a large proportion of the cases, and nearly one third were fit for duty in six months or less In the whole series there were only two cases in which a minor Estländer operation was performed in England None died But at least one third of the empyema cases had ultimately to be discharged as unfit simply on account of the chest condition, whereas there were none such in the sterile hæmothorax group

The original size of the empyema did not affect the ultimate classification of the convalescent as much as might have been expected About one half (31) of the 64 empyemata had been of large size—that is, roughly 50 oz or more, and about one half of the unfit and one half of those fit for duty were found to have belonged to the group of large empyemata The large sterile hæmothorax got back to duty equally soon, whether caused by bullet or shell, and whether the projectile was or was not retained But a retained foreign body in the septic cases did cause unfitness Thus in the latter group —

For 44 projectiles not retained there were 9 unfit = 20%
,, 20 ,, retained , , 11 ,, = 55%

TABLE X —*Total Results of Empyemata (64 Cases)*

—	Bullet		Shell		Total
	Out	Retained	Out.	Retained	
Duty					
6 months or less	9	—	6	3	18
After 6 months	4	1	4	2	11
Total for duty ..	13	1	10	5	29
Fair result (not finally classified)	4	—	8	3	15
Unfit	6	1	3	10	20
Total	23	2	21	18	64

4 of those marked unfit were found to be so after several months of light duty, and 3 of these had retained shell fragments 7 cases were traced back to full duty in France within a year of their wounds, and 2 of these had had large empyemata

THE MORTALITY AMONG CHEST WOUNDS IN FRANCE

The figures that have been given in the preceding tables may be taken as a fair index of what is the after history of chest wounds that have survived to be sent across the Channel under the present established methods of treatment

During the last nine months, however, the opinion has been gaining ground that better results might be obtained by more active surgery undertaken as soon as possible after the wound was inflicted French surgeons have felt this strongly, and in order to accumulate such evidence as was needed for arriving at a decision on the matter the subject was formally inscribed on the order of the day of the French Society of Surgery on Nov 29th, 1916 Since that date numerous papers and important series of statistics bearing on the question have appeared in the weekly *Bulletins de la Société de Chirurgie de Paris* It is argued in these papers that the mortality from chest wounds is much higher than was at first supposed, and that this high mortality requires vigorous efforts on the part of surgeons to save life Also, in respect of casualties who survive these wounds, evidence is brought forward to show that retained projectiles and especially shell fragments, almost always cause trouble, either by the introduction of sepsis, or, if

From these autopsy records it is evident that the retention of a foreign body does not bear any very close association with the fatal forms of septic hæmothorax that occur at the base hospitals.

Foreign bodies are retained in a large number of chest wounds, but even when embedded in the lung they frequently do not lead to the development of sepsis. Thus out of 83 clinically suspicious cases on the lines of communication in which a projectile was seen by X rays to be retained, only 21 per cent. developed empyemata.

Nor is there any satisfactory evidence from the British Medical Service that a retained foreign body in non infected cases does subsequently cripple the soldier. The 69 examples of sterile hæmothorax quoted in Tables III. and IV. of this paper had projectiles retained in 32.5 per cent. of them. Yet the only one who suffered from the retention was the patient who died in consequence of an operation for the removal of a harmless bullet. Colonel R. D. Rudolf, C.A.M.S., has kindly informed me that in his experience as consultant to a large number of Canadian hospitals in England he has met with no satisfactory proof that a soldier is incapacitated by a retained body in the chest, provided that sepsis had not developed at the time when the casualty was incurred. Until further proof to the contrary is produced, no good reason appears at present to justify early operations on cases with small retained projectiles or simple hæmothorax. The former cause an empyema or later troubles in only a small proportion of the cases. The sterile hæmothorax clot does not invalid a man for an indefinitely long period. Therefore it does not appear advisable in the light of present knowledge to operate as a routine simply in order to clear away hæmothorax clot and to remove a small foreign body.

But in certain carefully chosen cases the fresh work of surgeons has proved that early operations are more than justifiable: they are indeed urgently called for. Such operations may succeed in arresting deadly hæmorrhage, and it is beyond all doubt that they can abort the development of a grave infection in types A, B, and C. With these infecting groups of wounds, as with those where the abdomen as well as the thorax is implicated, the recent advances in chest surgery have already given brilliant results and succeeded in saving lives that would otherwise have most certainly been lost. The last paper of Pierre Duval[5] recounts many such achievements by the French, and equally happy results have rewarded the skill of surgeons with our own armies.

SUMMARY

The chief practical points of this paper may be summarised as follows:—

1. A sterile hæmothorax of moderate size, that is, of about 30 oz., will recover as rapidly by natural absorption as by aspiration.
2. The retention of foreign bodies in the chest in aseptic cases does not appear to exert any crippling effect for military service, but more accurate information is urgently needed on this point.
3. Cases of infected hæmothorax that have been drained in France and transferred to the United Kingdom generally recover rapidly and completely. None die and subsequent operations are rarely needed. More than one-half of these empyema cases can be returned to duty.
4. The late mortality from chest wounds is practically nil in England, and it is only 5 per cent. on the lines of communication in France, but in the area of the armies it is higher than was at first supposed. About 10 or 15 per cent. may die in medical units at an early date from the severity of the injury, and about 10 per cent. may die later at the casualty clearing station from complicating sepsis.
5. Among those casualties which develop sepsis within the chest the mortality is very high, rising to nearly 50 per cent. under the present system of treatment by rib resection and drainage.
6. The old conservative routine of surgical non intervention, except by late drainage, finds its justification only in the satisfactory recovery of those cases of gunshot wound of the chest which remain non infected—that is, about 75 per cent. The high mortality in those which develop sepsis demands a wider practice of the new prophylactic method of cleansing operations performed at an early hour on certain carefully chosen groups of cases.

Introduction.

DISEASES of the respiratory system which come under observation in the Aldershot Command are notorious for the inclusion of a large percentage of atypical cases. Taking the pneumonias, for example, a certain number conform with the book descriptions and pursue the orthodox course, but the majority, though undeniably lobar pneumonia, are nevertheless anomalous in many particulars. Furthermore, they pass without any definite line of demarcation into cases which are definitely broncho-pneumonia, and these in turn grade off without any well defined boundaries into conditions which some would diagnose as broncho-pneumonia, others as bronchitis of varying type and severity, finally to present at the end of a series cases of frankly simple bronchial catarrh.

One point which has impressed all who have had the opportunity of engaging in military practice in the Aldershot Command for any length of time is the occurrence of a considerable number of cases of a definite type clinically recognisable almost at sight, yet different from anything we have been familiar with in men of military age in civil life. To this peculiar type of case we have applied the designation "purulent bronchitis" on account of the characteristic nature of the expectoration. Whether or no we are justified in dignifying this sort of case as a clinical entity, or whether we are dealing with cases of modified simple bronchitis or broncho pneumonia, we feel that it is desirable to draw special attention to them for two chief reasons. In the first place, the affection has a very high mortality—very much higher than that of lobar pneumonia; secondly, there are features and circumstances which suggest an epidemic nature.

A Typical Case of Purulent Bronchitis.

A typical case is as follows. The onset is usually acute, the early symptoms are those of a "cold in the head." The temperature may be 101° or 102° F., but there are no features to distinguish the condition from acute "coryza" or febricula, so that in the majority of cases the patient does not report sick for two or three days, by which time he is sent to hospital. At this stage two features attract particular attention. First, the character of the expectoration: this consists of thick pale yellow dollops of almost pure pus, not the frothy expectoration familiar in ordinary bronchitis; it has no particular odour, and it becomes increasingly abundant until in a day or two it may amount to several ounces in the 24 hours. Secondly, the rapidity of the patient's breathing: this may be so evident that pneumonia suggests itself, yet on examining the chest the only physical signs consist of few or many rhonchi scattered widely, but most marked at the bases of the lungs behind, associated with wheezy vesicular murmur; resonance everywhere is unimpaired and bronchial breathing is absent. The characters of the temperature, pulse rate, and respiration-rate are exemplified below. A little later a third point attracts notice: a peculiar dusky heliotrope type of cyanosis of the face, lips, and ears, so characteristic as to hall mark the nature of the patient's malady even on superficial inspection. By this time dyspnœa is very pronounced; respiration consists of short shallow movements which in bad cases

C—— General Hospital —Receiving relatively light cases period November, 1915 to June 1916

161 pure chest wounds: 4 deaths = 2 5 per cent (also 1 death from abdominal combined with chest wound)

Septic cases 18 = 11 2 per cent. of total or 15 4 of those with effusion

Septic deaths: 4, or 22 2 per cent of septic cases

—	No hæmo-thorax	Sterile effusion.	Septic effusion	Total	Deaths
Rifle bullet	10	32	3	45	—
Shell	10	22	14	46	4
Not stated	24	45	1	70	—
	44	99	18	161	4

C—— Stationary Hospital —Selecting the serious cases out of convoys intended for C—— General Hospital named above: period January to July 1916

64 pure chest wounds 7 deaths = 11 per cent

Septic cases 10 = 15 6 per cent of total or 28·5 per cent. of those with effusions

Deaths in septic cases = 5, or 50 per cent of the septic cases

B—— General Hospital —Receiving severe cases period November, 1916 to May 1917

296 pure chest wounds: 23 deaths = 7 7 per cent

Septic cases 49 = 16 7 per cent. of total, or 24·0 per cent of those with effusions

Deaths in septic cases = 32 per cent during period of January to May

Projectiles: 25 per cent. of the septic cases were through and through wounds without retained foreign bodies

Among 106 cases submitted to X ray examination chiefly because they showed only an entrance wound the results were —

—	No hæmo-thorax	Sterile effusion	Septic effusion	Total
Projectile seen to be retained	33	32	18	83
Nothing seen by X ray	7	13	3	23

B—— Stationary Hospital.—Receiving relatively light cases: period June to December 1916

155 chest wounds, 5 deaths = 3 3 per cent. (also 3 deaths from abdominal combined with chest wounds)

Septic cases 18 = 11 3 per cent of total or 14 0 per cent. of those with effusions

Deaths in septic cases, 5 or 27 5 per cent

Projectiles: retained in 64 cases (49 shell) 4 deaths all from shell

Not retained in 73 cases (44 shell) 3 deaths one from shell

No statement for 21 cases: 1 death

The entire total of 676 cases of pure chest wounds on lines of communication yields the following figures —

General mortality on the lines of communication	5 8 per cent.
Deaths in septic cases	40·0 ,
Proportion of septic cases to all	14 0 ,,
Incidence of sepsis in cases with effusion	20·0 ,,

*These figures are more favourable in respect of the inci*dence of sepsis than those which I analysed in a paper with Colonel Bradford,[3] and they are nearer the truth because they include all the cases admitted to the hospitals during the *period under review, but even so they are unfairly* weighted by severe cases, because two out of the four hospitals were receiving centres for specially severe cases

Under the conservative policy of surgical non interference with chest wounds at the *onset*, the *general results may* therefore be very broadly stated as follows —

Estimated mortality in field ambulance and casualty clearing station 20 to 25 per cent. of which 10 to 15 per cent. are the early *result of shock and* hæmorrhage, while 10 per cent die from sepsis	
Actual mortality on lines of communication	5 per cent, all from sepsis
Actual mortality in England	*Practically nil*

The mortality from *hæmorrhage and shock* is about half of the total death rate in casualties admitted to medical units, though it is not a heavy percentage upon the entire number of bleeding wounds The surgeon at the front sees directly from his own experience which are the cases that are liable to die from such injury and he can at once judge the possibility of saving some of them by early operation

With *infection* the question is more difficult The mortality from sepsis, when deaths at the casualty clearing station are added to those at the base, probably rises to nearly 50 per cent in the cases of hæmothorax where infection has developed, and of those who survive after surgical treatment of the empyema at least one third will need to be invalided out of the Army The group in which a septic hæmothorax occurs is therefore one of most serious importance, and every possible means should be considered for dealing more efficiently with it The hope raised by recent progress in chest surgery is based upon preventive measures, and it is undeniably true that in certain cases an early operation has eradicated an infection that would otherwise have burst out into an empyema

Statistics, however, show that certainly not more than 25 per cent of untreated chest wounds develop this dangerous sepsis, so that it is plain that some selection of cases for operation must be made on the first day so as to choose only those which are likely to develop this complication The following groups have been considered from the point of view of arresting infection

Grouping of Cases in regard to Early Surgical Intervention

A Those with air suction and blood leakage through open holes that are obviously too large for early spontaneous closure The mortality in these when left with nothing but an occluding pad, is exceedingly high Very few are seen to arrive at base hospitals and these generally succumb a few days later unless they are of the favourable type where the wound is near the base of the chest and so chances to provide satisfactory drainage The gravity of the condition is due to the fact that the lung collapses away from the chest wall everywhere, thus leaving for the absorption of septic products an enormous surface of pleura uncovered by blood clot With a closed hæmothorax septic absorption is much slower and less dangerous The statistics quoted above do not clearly distinguish this group of cases, but the experience of every surgeon is agreed as to their serious nature if left without early operation

Grégoire[4] closed 17 of such cases at an early hour, only one died and the remainder recovered without the development of an empyema All surgeons who have attempted operative treatment for these cases have had the satisfaction of some favourable results

B Tangential wounds with severely comminuted ribs, in which there may be continued bleeding from intercostal vessels, while the lung is generally mangled near the wound Such cases are liable to develop a most serious streptococcal infection if the wound track be not immediately cleansed

C Those with large retained fragments of shell In the majority of such wounds death follows soon from hæmorrhage Nearly all the survivors develop gross infections *with anaerobe bacilli and streptococci* The wound track in the lung often holds infected fragments of rib or shreds of dirty clothing even at a distance from the lodging place of the projectile, and the latter almost always carries dirt upon it

A few of the casualties in this group do survive at the base, if the resultant empyema chances to be well localised and is properly drained It remains for surgery to prove whether expectant treatment or immediate attempts to clean the wound in chest and lung more or less completely by early operation will yield a lower death rate

D The group of those with *small* retained projectiles, either shell or rifle bullet Here some conclusions can be justly derived from general figures, despite the meagre nature of those that are available

Roughly 25 per cent of cases of hæmothorax develop sepsis, and out of these infected men 10 or 12 will die, either at the front or at the base But several of these septic cases must belong to Groups A, B, or C, others are caused by through and through wounds The statistics from General Hospital B——, quoted earlier in this paper, show that 25 per cent of all the septic cases, fatal or otherwise, were due to through and through wounds The actual mortality from sepsis in Group D must consequently be small

In a consecutive series of 53 autopsies made at a base hospital in septic deaths from pure chest wounds projectiles were found to be retained in the lungs in only 9 cases, or 17 per cent In 3 out of these 9, death was directly *due to* secondary hæmorrhage caused by sepsis around the retained foreign body in the lung The *figures for the* 53 septic deaths were as follows —

Through and through wounds foreign body not retained 23, or 43 per cent 7 being by shell

Penetrating wounds foreign body retained 30 or 57 per cent which included 25 by shell, of which 8 had foreign body in lung 5 by bullet, of which 1 had foreign body in lung

---

[3] British Journal of Surgery vol iii, 1915, p 247

[4] Loc. cit.

From these autopsy records it is evident that the retention of a foreign body does not bear any very close association with the fatal forms of septic hæmothorax that occur at the base hospitals

Foreign bodies are retained in a large number of chest wounds but even when embedded in the lung they frequently do not lead to the development of sepsis Thus out of 83 clinically suspicious cases on the lines of communication in which a projectile was seen by X rays to be retained, only 21 per cent developed empyemata

Nor is there any satisfactory evidence from the British Medical Service that a retained foreign body in non infected cases does subsequently cripple the soldier The 89 examples of sterile hæmothorax quoted in Tables III and IV of this paper had projectiles retained in 32 5 per cent of them Yet the only one who suffered from the retention was the patient who died in consequence of an operation for the removal of a harmless bullet Colonel R D Rudolf, C A M S, has kindly informed me that in his experience as consultant to a large number of Canadian hospitals in England he has met with no satisfactory proof that a soldier is incapacitated by a retained body in the chest, provided that sepsis had not developed at the time when the casualty was incurred Until further proof to the contrary is produced, no good reason appears at present to justify early operations on cases with small retained projectiles or simple hæmothorax The former cause an empyema or later troubles in only a small proportion of the cases The sterile hæmothorax clot does not invalid a man for an indefinitely long period There fore it does not appear advisable in the light of present knowledge to operate as a routine simply in order to clear away hæmothorax clot and to remove a small foreign body

But in certain carefully chosen cases the fresh work of surgeons has proved that early operations are more than justifiable, they are indeed urgently called for Such opera tions may succeed in arresting deadly hæmorrhage, and it is beyond all doubt that they can abort the development of a grave infection in types A, B, and C With these infecting groups of wounds, as with those where the abdomen as well as the thorax is implicated, the recent advances in chest surgery have already given brilliant results and succeeded in saving lives that would otherwise have most certainly been lost The last paper of Pierre Duval[5] recounts many such achievements by the French, and equally happy results have rewarded the skill of surgeons with our own armies

SUMMARY

The chief practical points of this paper may be summarised as follows —

1 A sterile hæmothorax of moderate size that is, of about 30 oz will recover as rapidly by natural absorption as by aspiration

2 The retention of foreign bodies in the chest in aseptic cases does not appear to exert any crippling effect for military service but more accurate information is urgently needed on this point

	44	99	18	161	4

C—— Stationary Hospital —Selecting the serious cases out of convoys intended *for C—— General Hospital* named above: period January to July, 1916

64 pure chest wounds: 7 deaths = 11 per cent

Septic cases 10 = 15 6 per cent of total or 28 5 per cent. of those with effusions

Deaths in septic cases = 5, or 50 per cent of the septic cases

B—— General Hospital —Receiving severe cases period November 1916 to May 1917

296 pure chest wounds 23 deaths = 7 7 per cent

Septic cases: 49 = 16 7 per cent. of total, or 24 0 per cent of those with effusions

Deaths in septic cases = 32 per cent during period of January to May

Projectiles: 25 per cent. of the septic cases were through-and through wounds without retained foreign bodies

Among *106* cases submitted to X ray examination chiefly because they showed only an entrance wound the results were —

—	No hæmothorax	Sterile effusion	Septic effusion	Total
Projectile seen to be retained	33	32	18	83
Nothing seen by X ray	7	13	3	23

B—— Stationary Hospital.—Receiving relatively light cases: period June to December 1916

155 chest wounds 5 deaths = 3 3 per cent (also 3 deaths from abdominal combined with chest wounds)

Septic cases 18 = 11 3 per cent. of total, or 14·0 per cent of those with effusions

Deaths in septic cases 5 or 27 5 per cent

Projectiles: retained in 64 cases (49 shell) 4 deaths all from shell

Not retained in 73 cases (44 shell) 3 deaths one from shell

No statement for 21 cases: 1 death

The entire total of 676 cases of pure chest wounds on lines of communication yields the following figures —

General mortality on the lines of communication	5 8 per cent
Deaths in septic cases	40·0 ,
Proportion of septic cases to all	14 0 ,,
Incidence of sepsis in cases with effusion ..	20·0 ,

These figures are more favourable in respect of the incidence of sepsis than those which I analysed in a paper with Colonel Bradford,[3] and they are nearer the truth because they include all the cases admitted to the hospitals during the period under review, but even so they are unfairly weighted by severe cases, because two out of the four hospitals were receiving centres for specially severe cases

Under the conservative policy of surgical non interference *with chest wounds at the onset*, the general results may therefore be very broadly stated as follows —

Estimated mortality in field ambulance and casualty clearing station 20 to 25 per cent. of which 10 to 15 per cent are the early result of shock and hæmorrhage while 10 per cent. die from sepsis	
Actual mortality on lines of communication	5 per cent, all from sepsis
Actual mortality in England	Practically nil

The mortality from *hæmorrhage and shock* is about half of the total death rate in casualties admitted to medical units though it is not a heavy percentage upon the entire number of bleeding wounds The surgeon at the front sees directly from his own experience which are the cases that are liable to die from such injury, and he can at once judge the possibility of saving some of them by early operation

With *infection* the question is more difficult The mortality from sepsis, when deaths at the casualty clearing station are added to those at the base, probably rises to nearly 50 per cent in the cases of hæmothorax where infection has developed, and of those who survive after surgical treatment of the empyema at least one third will need to be invalided out of the Army The group in which a septic hæmothorax occurs is therefore one of most serious importance, and every possible means should be considered for dealing more efficiently with it The hope raised by recent progress in chest surgery is based upon preventive measures, and it is undeniably true that in certain cases an early operation has eradicated an infection that would otherwise have burst out into an empyema'

Statistics, however, show that certainly not more than 25 per cent of untreated chest wounds develop this dangerous sepsis, so that it is plain that some selection of cases for operation must be made on the first day so as to choose only those which are likely to develop this complication The following groups have been considered from the point of view of arresting infection

Grouping of Cases in regard to Early Surgical Intervention

A. Those with air suction and blood leakage through open holes that are obviously too large for early spontaneous closure The mortality in these, when left with nothing but an occluding pad, is exceedingly high. Very few are seen to arrive at base hospitals and these generally succumb a few days later unless they are of the favourable type where the wound is near the base of the chest and so chances to provide satisfactory drainage The gravity of the condition is due to the fact that the lung collapses away from the chest wall everywhere, thus leaving for the absorption of septic products an enormous surface of pleura uncovered by blood clot With a closed hæmothorax septic absorption is much slower and less dangerous The statistics quoted above do not clearly distinguish this group of cases, but the experience of every surgeon is agreed as to their serious nature if left without early operation

Grégoire[4] closed 17 of such cases at an early hour, only one died and the remainder recovered without the development of an empyema All surgeons who have attempted operative treatment for these cases have had the satisfaction of some favourable results

B Tangential wounds with severely comminuted ribs, in which there may be continued bleeding from intercostal vessels, while the lung is generally mangled near the wound Such cases are liable to develop a most serious streptococcal infection if the wound track be not immediately cleansed

C Those with large retained fragments of shell In the majority of such wounds death follows soon from hæmorrhage Nearly all the survivors develop gross infections with anaerobe bacilli and streptococci The wound track in the lung often holds infected fragments of rib or shreds of dirty clothing even at a distance from the lodging place of the projectile, and the latter almost always carries dirt upon it

A few of the casualties in this group do survive at the base, if the resultant empyema chances to be well localised and is properly drained It remains for surgery to prove whether expectant treatment or immediate attempts to clean the wound in chest and lung more or less completely by early operation will yield a lower death rate

D The group of those with small retained projectiles, either shell or rifle bullet Here some conclusions can be justly derived from general figures, despite the meagre nature of those that are available

Roughly 25 per cent of cases of hæmothorax develop sepsis, and out of these infected men 10 or 12 will die, either at the front or at the base But several of these septic cases must belong to Groups A, B, or C, others are caused by through and through wounds The statistics from General Hospital B——, quoted earlier in this paper, show that 25 per cent of all the septic cases, fatal or otherwise, were due to through and through wounds The actual mortality from sepsis in Group D must consequently be small

In a consecutive series of 53 autopsies made at a base hospital in septic deaths from pure chest wounds projectiles were found to be retained in the lungs in only 9 cases, or 17 per cent In 3 out of these 9, death was directly due to secondary hæmorrhage caused by sepsis around the retained foreign body in the lung The *figures for the* 53 septic deaths were as follows —

Through and through wounds, foreign body not retained 23, or 43 per cent 7 being by shell

Penetrating wounds foreign *body retained* 30 or 57 per cent which included 25 by shell, of which 8 had foreign body in lung; 5 by bullet of which 1 had foreign body in lung auxiliary military hospital At this time thick yellow purulent phlegm was still being expectorated in abundance and rhonchi were still audible over both lungs At the auxiliary military hospital he suffered a relapse associated with the development of dullness bronchial breathing and crackling râles over the lower half of the right lung behind The bronchial breathing at the right base was very slow to clear up and there were still abnormal signs at this base on June 16th 1917 On June 15th the chest was needled but no fluid was found in the pleural cavity

---

[4] Loc. cit.

The bacteriological findings were as follows The first examination of the sputum showed the presence of *B influenzæ* *Micrococcus catarrhalis* and a streptococcus the second examination the presence of *B influenzæ* pneumococcus *Micrococcus catarrhalis* *Streptococcus longus* and *B fusiformis* (Chart IA, IB.)

CHART IA (CASE 1)

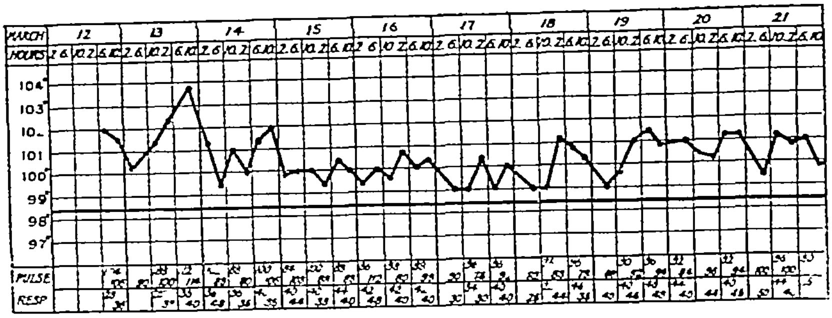

CHART IB (CASE 1)

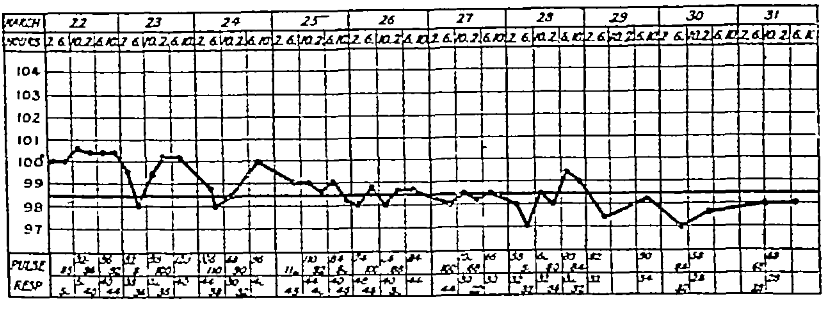


CASE 2.—D —— Terr Reserve Batt age 16 service one month. Admitted on March 17th 1917 having been taken ill the previous day with shivering cold and pain in the chest. The temperature was 104 F pulse rate 118 respiration rate, 44 The patient was very restless and had much dyspnœa but was not cyanosed The anterior aspect of the lungs presented normal signs posteriorly there were coarse râles non-consonating in character at both bases The sputum was abundant thick purulent airless for the most part pale yellow but with here and there a trace of blood Two days later the patient was very distressed in his breathing restless and moderately cyanosed Râles and rhonchi were present all over both lungs The amount of sputum in the 24 hours was 15 ounces. He was treated by an antiseptic inhalation and an expectorant mixture and his condition was so bad at one time that pituitrin injections were resorted to On March 20th he was better but the sputum was still very thick and abundant, 10 ounces being coughed up in 24 hours On March 22nd the sputum in 24 hours did not exceed 5 ounces and in character it was beginning to be frothy From this time onwards he recovered rapidly and was discharged to duty on April 19th 1917

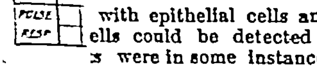
The bacteriological findings were as follows The sputum showed the presence of *B influenzæ* pneumococcus and staphylococcus (Chart II)

Purulent sputum, with rhonchi in the chest persisted until April 23rd after which convalescence was rapid and the man was transferred to an auxiliary military hospital on April 27th 1917

The bacteriological findings were as follows The sputum showed the presence of *B influenza* pneumococcus and *Micrococcus catarrhalis* (Chart III)

CASE 4—H 2nd A M R F C age 35 service four months Admitted on April 4th 1917 with a history of having been out of sorts with a cold and bronchial cough for ten days previously On admission his temperature was 103° F pulse-rate 112 respiration rate 36 Abundant blood stained purulent sputum The accompanying temperature chart indicates the course of the disease The man was seriously ill with purulent bronchitis for ten days improved considerably for a short time then relapsed for a week becoming seriously ill again, but ultimately recovering com Throughout the whole was in hospital he was up abundant thick at first blood

CHART II (CASE 2)



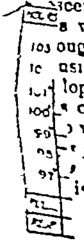
1 severe but not fatal, 2 fatal cases Two cases were only examined bacteriologically whilst convalescing

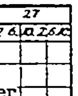
Sputum

Microscopical — Film preparations stained by various methods showed pus cells held together in dense masses by fibrin, with epithelial cells and numerous bacteria. No ells could be detected The bacteria although s were in some instances limited apparently to two

CASE 3-namely, (*a*) minute Gram negative bacilli often
three days g bipolar staining and so simulating diplococci
a col l in intracellular but also in extracellular bunches,
a dry cou extracellular Gram positive lanceolate diplococci
behind th
a this th the bacteriological flora was often very varied
numerou orphology and staining reactions in every instance
first had
thick yell n negative bacillus predominated No tubercle bacilli
consisted countered in any of the specimens

ral —Cultivations were established in every case blood agar, and in 7 of the 8 resulted in a copious h of *B influenzæ* associated with *Streptococcus olatus* (pneumococcus) The exception was a con scent case whose sputum was overlooked, and culture s were not planted until four days after collection, ough intracellular Gram negative bacilli were observed in usion in the films of the sputum the only organism that loped in culture was *Staphylococcus albus* In different one or other species of the *Micrococcus catarrhalis* was met with, also *Micrococcus pyogenes aureus* *Micrococcus pyogenes albus* *Streptococcus pyogenes longus* *Strepto ccus* and *Micrococcus tetragenus* The only two isms common to the entire series however were





identical

1 The local appearances described as produced by the pneu and microscopically consisted of with a minimum of fibrin and enormous cocci, in one of the local lesions a bacilli were also found after prolonged search in each instance gave a mixed growth of pneumococcus and *B influenzæ*

2 *Heart blood* —This contained numerous pneumococci and cultures gave a pure growth of pneumococci

3 *Spleen pulp* —This showed pneumococci and in one some bunches of minute Gram negative bacilli Cultures gave a mixed growth of pneumococcus and *B influenzæ*

The pneumococcus isolated from the heart blood of one of these rabbits was tested and found to possess standard virulence—viz , minimal fatal dose = 0·000001 loop

Virulence Determinations

(*a*) *Pneumococci* —An attempt was made to estimate the virulence of the strains of pneumococci isolated from the original sputa from three of the cases (from two mild and one severe subsequently fatal case) by the method described by Eyre and Washbourn In each of these three strains the virulence was found to be exceedingly low a dose of many loopfuls being needed to kill a mouse as compared with standard virulence of 0 000001 loop The various strains of pneumococci present in the original sputa must therefore be regarded as of exceedingly low virulence but capable of readily acquiring a high degree of virulence as evidenced by the standard virulence of a strain after passage through one rabbit only (see inoculation of sputum above)

Diagrams Showing a Few of the Types of the Protozoon of Trench Fever seen in Venous Blood and the Blood and Cells from Spleen and Liver Punctures

In order to study the cycle of development of the organism the blood and cells from liver, spleen, and lung punctures have been examined At Lieutenant R M Wilson's suggestion the cerebro spinal fluid from six of the cases was centrifugalised and the deposit examined The intrathecal pressure of the fluid varied from 10–20 mm. of mercury, the number of cells present varied from one to five or six in 4 c c and were invariably lymphocytes No signs of any hæmogregarines were noted, but the relief of the "shin pain," the hyperalgesia of the skin of middle third of front of legs, the pains in right shoulder, and spleen pains, &c, was so marked, while there was no tendency whatsoever for the pain to return when from 10–12 c c of the fluid were withdrawn, that it is now adopted as a routine method of treatment in such cases of severe pain when other simpler measures have failed to afford relief

One precaution has to be observed in the after treatment of lumbar puncture when the amount of fluid and its pressure are normal—viz, to keep the patient in bed, the foot-end of which has been raised 8–10 inches for at least 36–48 hours in order to avoid the typical lumbar puncture headache which usually follows if the patient is allowed to sit up too soon after the operation This period of rest can be reduced to 6–10 hours if the 10–12 c c. of cerebro spinal fluid removed is at once replaced by a similar volume of sterile normal saline

As the inguinal lymphatic glands were noted to be enlarged and somewhat shotty in certain cases the blood from gland puncture in several of the patients was examined, and in one or two the presence of the hæmogregarine was detected with difficulty and after prolonged examination of thin and thick films (Major W Byam informs me that this shotty condition of the inguinal glands is common in the soldier, and that such enlargement cannot be associated with trench fever In some of the cases, however, axillary and cervical glands were somewhat hard and shotty, and in these specific disease could apparently be excluded)

The difficulty of finding the protozoon in the lymphatic glands suggests that such are not their habitat as is the liver, and to a less extent the spleen and lung and probably the bone marrow The examination of the blood withdrawn from the periosteal thickenings of the tibia in certain of the cases is being followed up, but with indefinite results up to the present The blood films were stained by one or other of the following methods Giemsa's, Leishman's, or Wright's, and in certain cases Heidenheim's iron hæmatoxylin method

A rapid staining method has also been used with excellent results—viz 0 228 gramme of eosin azur ground up and dissolved in 50 c c of pure methyl alcohol. This is allowed to stand for 10–12 days and the supernatant fluid centrifugalised and used to fix and stain the films After three minutes' action of the stain it is rapidly washed away by quickly drawing the slide through distilled water once or twice and then quickly and vigorously shaking dry in order to avoid prolonged action of the water which removes the blue from the structures stained therewith

Short Description of Protozoon

The two more common types of the hæmogregarine encountered in the venous blood a day or two before the onset of pyrexia are (1) macromerozoites 7–13 μ long (these are generally free in the plasma) and (2) micromerozoites 3–4 μ long more commonly encysted, and in the red corpuscles, but may be free In addition to the micromerozoites, &c, which are slender, not more than 1 μ wide at the most, there are other free or encysted "sausage shaped" forms 4–6 μ long by 3–4 μ wide Within their transparent cyst the blue stained cytoplasm stands out clearly and the deep-red-stained nucleus consists of small pyriform masses of chromatin

DESCRIPTION OF ILLUSTRATIVE PLATE

I to V —A few of the stages of the development of the parthenogenetic gametocyte in the venous blood liver and spleen showing division of the nucleus with its dense chromatin into ultimately 20 merozoites The blue-stained coarsely reticular cytoplasm and the nucleus *de reliquat* are very distinct in all the stages figured The merozoites at sporulation are drawn double the actual size (Fig V) (Stained by Wright's method)

VI —Fully developed merozoite (Stained by Wright's method)

VII —Female gametocyte (Stained by Wright's method)

VIII —Encapsulated micromerozoites within the red corpuscles (Stained by eosin azur II method see text)

N.B —The upper scale of microns applies to Figs I -VI the lower scale to Figs VII and VIII only (*b*) *B influenzæ* —As the *B influenzæ* is usually regarded as without lethal effect upon the lower animals, except when introduced directly into the brain tissue, no virulence estimations were attempted Inoculations were however, made with strains of *B influenzæ* isolated from two of the "mild" cases Two small rabbits of 500 grammes each were subjected to intrapulmonary inoculations—about three loopfuls of a 24 hours old blood agar culture emulsified in 0 1 c c sterile saline solution being injected into the lung tissue by means of a hypodermic syringe provided with fine needle, which was plunged through the chest wall directly into the substance of the lung One experiment was a complete failure, as the needle passed through the right lower lobe and injured a large vessel causing a right-sided hæmothorax, and the animal died some 12 hours later The second inoculation was more successful, the inoculum being deposited in the centre of the right upper lobe At the autopsy, performed on the fifth day, the right pleural cavity contained rather more than 2 c c of opalescent fluid, the centrifugalised deposit from which showed large numbers of polynuclear cells, many of which were packed with influenza bacilli, eosinophile cells and some mononuclears and endothelial cells Cultures gave a rich growth of *B influenzæ* The upper lobe of the right lung was enveloped in a layer of lymph which extended between the lobes Cultures from the lung tissue gave a pure growth of *B influenzæ* Cultures from the heart blood yielded a luxurious growth of *B influenzæ* which contained many thread forms Cultures from the spleen gave a good growth of *B influenzæ*, the individual bacilli in which were fairly uniform in length It was intended to test further the pathogenetic activities of *B influenzæ* but during the absence of one of us from the laboratory owing to illness the various strains died out and this portion of the investigation had perforce to be abandoned

General Bacteriological Conclusions

It seems not unlikely that these patients suffer from a primary invasion of their lung tissues by the *B influenzæ*, and that pneumococci, present at the same time, are at first of low virulence The earlier symptoms seem to be attributable to a *B influenzæ* toxæmia Exaltation of the virulence of the pneumococci by symbiotic growth with *B influenzæ* would appear to follow, a fatal termination being due to pneumococcal septicæmia

Mortality

Although the above eight cases constitute but a small portion of the total number that have been in the hospital altogether, they were consecutive cases not selected in any way and they show a mortality of 25 per cent, sufficiently indicating the seriousness of the disease When a patient has become decidedly cyanosed no treatment that we have been able to devise appears to do any good Loss of men from the malady is likely to be prevented not so much by means of treatment when the disease is well established as by getting the men into hospital early when they are in a condition of what in civil practice would be regarded perhaps as a quite trivial bronchial catarrh Seeing that a large percentage of our cases came from one unit—6 out of 8 in the above series, although the Connaught Hospital admits patients without selection from almost every unit in the command—and seeing that the bacterial infection appears to be primarily an influenzal one another line of treatment which suggests itself is isolation of the cases and disinfection in the hope of preventing the spread by contact of this serious form of influenzal infection, and thus consequent loss of life We could emphasise again that although we have dealt with only eight cases in detail we have had a much larger number altogether, and we have heard that the malady has been by no means confined to our command

Our best thanks are due to Lieutenant-Colonel William Turner, C M G, officer commanding the Connaught Hospital, for permission to publish these cases

Note —Since the above article was completed a more thorough and elaborate publication on the subject has appeared in THE LANCET of July 14th, 1917, p 41 in which [illegible] Ro [illegible] Sho [illegible] investigat [illegible] cases

TRENCH FEVER, OR P U O, ASSOCIATED WITH THE PRESENCE OF A HÆMOGREGARINE

BY LYN DIMOND M B, CH B MANCH,
CAPTAIN R A M C BACTERIOLOGIST MILITARY HOSPITAL, HAMPSTEAD

THE presence of a small hæmogregarine resembling in many respects the *Hæmogregarina gracilis* found by Wenyon[1] in a lizard host, *Mabuia quinquetæniata*, has been noted in the venous blood, the blood from liver spleen, and lung punctures in 12 cases of P U O or trench fever As a prolonged investigation of the capillary blood by means of thin films and the Ross thick film method failed to give uniform positive results an examination of the venous blood was undertaken

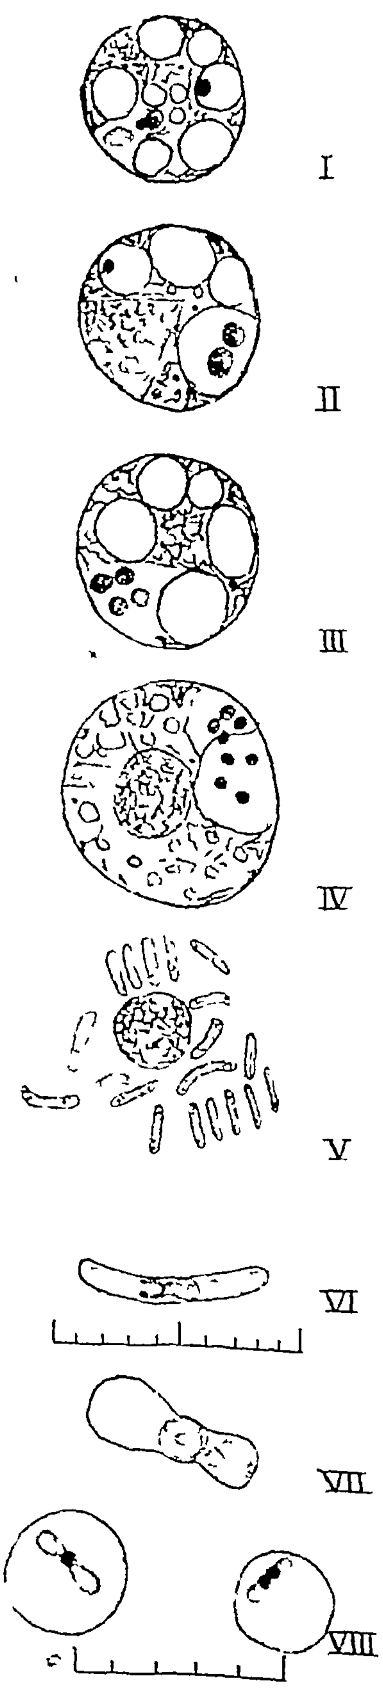
An enormous number of films were examined and at frequent intervals forms were discovered which by their shape and staining reactions suggested the possibility that they might be hæmogregarines As these bodies were obviously present in small numbers, even when the blood was examined upon the day or two preceding the febrile stages of the disease, the following technique was adopted in order to obtain the necessary number for purposes of diagnosis and observation

Technique —The specimens of blood from the cases of trench fever, which included 8 of McNee, Renshaw, and Brunt's[2] Class A and 4 of their Class B, or periodically relapsing type, were invariably examined together with the blood of controls in whose case trench fever and even the contact with lice could be excluded Thirteen such control cases have been so examined The distilled water used was invariably filtered through porcelain, and all the glass apparatus and slides were specially well cleaned, sterilised, and the latter kept in absolute alcohol and flamed before use in order to exclude extraneous organisms such as yeasts &c All blood films however prepared, were immediately covered with glass shades in order to avoid the possibility of any organisms gaining access thereto from the air

Two c c of the venous blood was obtained by means of a 2 or 5 c c syringe from the median basilic vein and at once syringed into a sterile filtered solution of 1 8 per cent sodium citrate To this was added 2 3, or 4 c c of a 0 5 per cent solution of saponin previously filtered and sterilised in order to cause complete hæmolysis of the red corpuscles and more or less complete cytolysis of the leucocytes according to the amount added The clear red fluid was then placed in the boats of a centrifuge and centrifugalised for 1½ to 2 hours, when all the supernatant clear fluid was poured off and the deposit spread on clean flamed glass slides by means of a sterile pipette and allowed to dry in the air

An unstained preparation was in addition always mounted in the following way A thin circle of sterile paroleine was traced out on a slide and a drop of the deposit placed in the centre of a coverslip which was then gently dropped upon the paroleine By this means a specimen was obtained in which the movements of the organism could be observed for considerable periods of time, as the thin layer of paroleine surrounding the drop of the deposit prevents evaporation which rapidly takes place when the ordinary fresh preparation is being examined on the warm stage During the periods just preceding pyrexia when the protozoa are most numerous the following modification is used Three or four c c of the suspension of the 2 c c of blood in sodium citrate solution are added to 12 to 15 c c of the sterile, filtered distilled water The water completely hæmolyses the red corpuscles but has the advantage that apart from causing swelling up of the leucocytes, it leaves them more or less intact and so allows observation to be made as to the presence or not of parasites within the leucocyte cytoplasm

The movements of the stained parasites, &c, can be followed on the warm stage by the azur I saline paroleine method and of the unstained parasite thrown into relief against a red background by the trypan red saline-paroleine method described in "The Blood Platelets in Health and Disease"[3] In the case of trypan red in certain dilutions there appears to be a definite slowing and cessation of the characteristic movements of the parasite, as is also the case when trypan blue and trypa flavine are used Clinically these [illegible] venous exhibition



Diagrams Showing a Few of the Types of the Protozoon of Trench Fever seen in Venous Blood and the Blood and Cells from Spleen and Liver Punctures

In order to study the cycle of development of the organism the blood and cells from liver, spleen, and lung punctures have been examined At Lieutenant R M Wilson's suggestion the cerebro spinal fluid from six of the cases was centrifugalised and the deposit examined The intrathecal pressure of the fluid varied from 10–20 mm. of mercury, the number of cells present varied from one to five or six in 4 c c, and were invariably lymphocytes No signs of any hæmogregarines were noted, but the relief of the "shin pain," the hyperalgesia of the skin of middle third of front of legs, the pains in right shoulder, and spleen pains, &c, was so marked, while there was no tendency whatsoever for the pain to return when from 10–12 c c of the fluid were withdrawn, that it is now adopted as a routine method of treatment in such cases of severe pain when other simpler measures have failed to afford relief

Technique —The specimens of blood from the cases of trench fever, which included 8 of McNee, Renshaw, and Brunt's[2] Class A and 4 of their Class B, or periodically relapsing type, were invariably examined together with the blood of controls in whose case trench fever and even the contact with lice could be excluded Thirteen such control cases have been so examined The distilled water used was invariably filtered through porcelain, and all the glass apparatus and slides were specially well cleaned sterilised, and the latter kept in absolute alcohol and flamed before use in order to exclude extraneous organisms such as yeasts, &c All blood films however prepared, were immediately covered with glass shades in order to avoid the possibility of any organisms gaining access thereto from the air

Two c c of the venous blood was obtained by means of a 2 or 5 c c syringe from the median basilic vein and at once syringed into a sterile filtered solution of 1 8 per cent sodium citrate To this was added 2 3, or 4 c c of a 0 5 per cent solution of saponin previously filtered and sterilised in order to cause complete hæmolysis of the red corpuscles and more or less complete cytolysis of the leucocytes according to the amount added The clear red fluid was then placed in the boats of a centrifuge and centrifugalised for 1½ to 2 hours, when all the supernatant clear fluid was poured off and the deposit spread on clean flamed glass slides by means of a sterile pipette and allowed to dry in the air

An unstained preparation was in addition always mounted in the following way A thin circle of sterile paroleine was traced out on a slide and a drop of the deposit placed in the centre of a coverslip which was then gently dropped upon the paroleine By this means a specimen was obtained in which the movements of the organism could be observed for considerable periods of time, as the thin layer of paroleine surrounding the drop of the deposit prevents evaporation which rapidly takes place when the ordinary fresh preparation is being examined on the warm stage During the periods just preceding pyrexia when the protozoa are most numerous the following modification is used Three or four c c of the suspension of the 2 c c of blood in sodium citrate solution are added to 12 to 15 c c of the sterile, filtered distilled water The water completely hæmolyses the red corpuscles, but has the advantage that apart from causing swelling up of the leucocytes, it leaves them more or less intact and so allows observation to be made as to the presence or not of parasites within the leucocyte cytoplasm

The movements of the stained parasites, &c, can be followed on the warm stage by the azur I saline paroleine method and of the unstained parasite thrown into relief against a red background by the trypan red saline paroleine method described in "The Blood Platelets in Health and Disease"[3] In the case of trypan red in certain dilutions there appears to be a definite slowing and cessation of the characteristic movements of the parasite, as is also the case when trypan blue and trypa flavine are used Clinically these dyes are being tried, and already the intravenous exhibition of the latter has given good results

In addition to the above technique, diagnosis has been confirmed by prolonged study of ordinary thick and thin films of the venous blood

The child seemed to be getting slightly better on the 8th ıd 9th. It could only take fluids very well at some times, ıdly at others Intelligence slightly better On the 9th it ould grasp a finger put into its hand The temperature, wever was higher The excoriations in perianal region re very much better, and the stools green at first had ome brown On the 10th the swellings in the joints had ırely subsided, joints were normal in every respect, ept stiffness due to meningitic condition The fontanelle all along been level with the surroundings, and not tense the 10th the physical signs were all as on admission, pt that the knees were rigidly extended, and the cry less ıent The abdominal wall was lax as before but minal reflex was absent. Lumbar puncture at 2 P M slightly more turbid fluid than before under slightly ısed pressure 15 c c collected but not examined On lth general condition was worse, child quite uncon

head and eyes were turned to the right, but head could asily be moved to the left Opisthotonos still present idity altogether less than up to previous day Reflexes aggerated (abdominal reflex absent) but not former y to clonus in knee-jerks Left knee-jerk was much isk and pronounced than right Joints quite normal Fontanelle slightly tenser than before, still level roundings Meningitic cry less frequent Throat redder than normal tonsils remained slightly , but not acutely inflamed Heart s action very rapid. ıe moist sounds could be heard all over right lung ıal wall quite lax abdominal reflex absent Liver to 1½ inches below costal margin in right nipple en not palpable The feeds were being taken very ools were greenish yellow, but perianal excoriation ter

M on the 11th the child looked very much worse. ıd stopped Fontanelle tense, slightly bulging

puncture gave 15 c c of very turbid fluid like flowing quite freely, under slightly increased A culture from this was put up on blood agar, and

Med Jour 1913, ii., 1056

TENARIAN —Mrs Jane Welsford, ted the 103rd anniversary of her

E METCALFE —By the death B S Durh the con mi y of t a good fri ed at and St T pital in N and me years n on ıment in hite ut Society le th so arranged as to give it a rosette appearance Other types of "sausage" bodies are encountered in the blood of these cases similar in size to the preceding, but whose round or oval nucleus consists of a thin red stained circumference with a single deep-red chromosome at its centre One or other or all of these types of merozoite may be present according to the stage of the disease in relation to the pyrexia, being most numerous just preceding the febrile stage They gradually increase in number up to the height of fever, when they disappear, and the day after the pyrexia none of these forms can be found in the blood, the only form of parasite then present being the parthenogenetic gametocyte This gametocyte can be found in different stages of development according to the time elapsed subsequent to the pyrexial stage, and ultimately just before the rise of temperature gives rise to 20 merozoites

A rough diagram of the cycle of development of this parthenogenetic origin of the merozoites is appended, as during the latent stages of trench fever a diagnosis can be made with absolute certainty by finding any of these characteristic bodies in the venous blood, spleen, or liver Personally I have found spleen puncture the quickest way to establish the diagnosis of trench fever

In brief, this gametocyte of the hæmogregarine of trench fever is a round, oval, or bluntly triangular body in shape, which in the first stages of development is 4–6 μ long by 3–5 μ wide The cytoplasm is stained an intense blue, and is coarsely reticular in specimens stained by Giemsa's method There is a large, diffuse purple nucleus *de reliquat* and at the periphery of the cell there is a dense, deep red stained nucleus rich in chromatin This is usually situated at an opposite pole to the nucleus *de reliquat*, and in the first stages of development it is round, later oval, and then rod shaped As development continues this nucleus divides into two, then four, eight, until when 20 nuclei are formed sporulation commences with the setting free of 20 small merozoites These merozoites at the moment of sporulation are generally 0 75–1 2 μ long, and gradually become larger until the mid stages of pyrexia when they disappear from the venous blood In distinction from the gametocyte of latent malaria (*H vivax* infection) this gametocyte of trench fever possesses no pigment or hæmozoin The size of the gametocyte at the moment of sporulation is 13–15 μ. In addition to this form of development of the merozoites, the micromerozoites develop by a process of schizogony, the schizont when first noted in the liver or blood being an oval purple stained body 5 5 μ long by 4 5 μ broad, the periphery of which is crenated and just within which crenations is a row of small nuclei which completely encircle the schizont

There is also evidence that the merozoites develop asexually with the production of a second type of schizont in the liver In the liver and occasionally in the venous blood what are apparently the gametocytes, or sexual forms, are to be noted The female gametocyte consists of a circular dense ring shaped nucleus with a central chromosome On either side of the nucleus are two semicircular uniform masses of cytoplasm, one of greater transverse diameter than the other The measurements of a typical example are length 5 μ width of wider cytoplasmic mass 3 4 μ, of the smaller 2 2 μ, and the diameter of the nucleus 1 7 μ The male gametocyte is a round or egg shaped body 3–3 5 μ in diameter with a centrally situated nucleus usually with three chromatin masses Both these two bodies are very distinct, easily recognised in fresh preparations, and when stained by Giemsa's method the cytoplasm stains an azure blue and the nucleus a very distinct deep red

The fact that this protozoon of trench fever is a hæmogregarine suggests the extreme probability that the *Pediculus corporis*, or what is even more likely that a louse allied to the *Hæmatopinus stephensi*, described by Newstead and Christophers as parasitic on the Indian field rat, is the carrier of the protozoon The presence of such large numbers of rats in the trenches which come into close association with our troops seems to favour this conclusion An effort is being made to trace out the cycle of sporogony in the stomach cells of the different types of lice commonly present in the under clothing of our soldiers

I would like to take this opportunity of thanking Major Byam, R A M C, to whom I am indebted for bringing together in one hospital the clinical material upon which the present work is being done In addition, I would like to thank Miss Brad and Corporal Haylock, my assistants, for their help in carrying out this research I am also much indebted to Lieutenant Wilson, R A M C, who has clinical charge of these cases, for much help and valuable suggestions.

Since writing the above paper I have had opportunities of confirming the presence of the hæmogregarine in a number of other cases of trench fever, and also, in addition, in cases of D A.H complicated with some of the clinical signs of P U O and one or two cases of definite benign tertian malaria

In the cases of double infection, with the parasites of malaria and trench fever, a significant feature was the fact that quinine was powerless to subdue completely the pyrexial attacks which we now know were partly due to the protozoon of malaria and partly to the hæmogregarine of trench fever

A CASE OF INFLUENZAL MENINGITIS

By K S BHAT, M R C S, L R C P LOND,
RESIDENT MEDICAL OFFICER, EAST LONDON HOSPITAL FOR CHILDREN, SHADWELL, E

PATIENT, a female child aged 14 months admitted on March 7th, 1917, into East London Hospital for Children, Shadwell under care of Dr T Fisher The child had then been ill ten days with "bronchitis" and had been treated outside The illness started with a sore-throat, the child had vomited and gone blue in lips on first day of illness It was coughing during five days previous to admission The right shoulder, left wrist, and left ankle joints were noticed to have swollen on the day before admission No tuberculous family history

The child looked obviously ill and semi-conscious and not quite intelligent It would not grasp a finger put into its hand It was very restless, jerking the limbs about now and then, and frequently uttering a sharp short cry without apparent external cause Head was strongly retracted and neck rigid, altogether a moderate degree of opisthotonos Arms were adducted over chest, elbows semi-extended, wrists strongly dorsiflexed, fingers bent into palms, and the whole limbs rotated so that dorsal aspects of wrists faced each other Toes bent into soles, ankles hyper-extended Knee-jerks very exaggerated, tending to clonus, plantar reflexes extensor Kernig's sign was very evident in both limbs. Supinator jerk present on right side, not looked for on left. Abdominal wall lax, abdominal reflex present Lungs quite normal no sign of bronchitis Heart's action rapid, nothing else abnormal about heart or pulse, rate 140, respirations 36, temperature 101° F Spleen not palpable liver one inch below costal margin in right nipple line The abdominal skin was slightly inelastic Pupils reacted normally to light. Fontanelle not bulging The throat was slightly redder than normal, tonsils slightly enlarged The external genitals and perianal region generally were much excoriated Doughy swellings were present in right shoulder, left wrist and left ankle joints, no fluid detected Movement was practically perfect in range, but evidently painful and resisted

On account of these swellings and the evident meningitic condition the child was admitted into hospital with the diagnosis of tuberculous meningitis Lumbar puncture was done soon after admission.

The cerebrospinal fluid was very slightly turbid, under slightly increased pressure, Cells 150 per c mm, 54 p c. polymorphonuclears, 46 p c lymphocytes In counting these 100 cells 18 "endothelial" cells also seen Globulin slightly increased, no reducing substance present The film made from c s fluid for differential count of leucocytes showed typical influenza bacilli in large numbers, both short isolated bacilli and long chain forms These long chain forms were found to consist of the short bacilli joined end to end by a cell membrane This resolution needed an objective of N A 1 3, and was better shown with an objective of N A. 1 4 The bacilli were almost all extracellular, very few indeed being seen within the polymorphonuclears Cultures showed the organism to be a typical bacillus of influenza Subsequently on another lumbar puncture a culture was taken on blood agar and sent to Dr P N Panton, who very kindly examined it and pronounced the culture sent to be "a typical bacillus of the influenza type

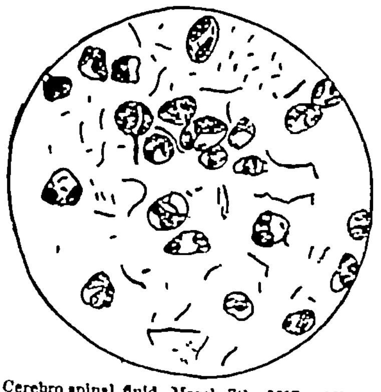
The child seemed to be getting slightly better on the 8th and 9th It could only take fluids very well at some times, badly at others Intelligence slightly better On the 9th it would grasp a finger put into its hand The temperature, however, was higher The excoriations in perianal region were very much better, and the stools, green at first, had become brown On the 10th the swellings in the joints had entirely subsided, joints were normal in every respect, except stiffness due to meningitic condition The fontanelle had all along been level with the surroundings, and not tense On the 10th, the physical signs were all as on admission, except that the knees were rigidly extended, and the cry less frequent The abdominal wall was lax as before, but abdominal reflex was absent Lumbar puncture at 2 P M gave slightly more turbid fluid than before under slightly increased pressure 15 c c collected, but not examined On the 11th, general condition was worse, child quite unconscious

The head and eyes were turned to the right, but head could fairly easily be moved to the left Opisthotonos still present, but rigidity altogether less than up to previous day Reflexes still exaggerated (abdominal reflex absent) but not former tendency to clonus in knee-jerks Left knee-jerk was much more brisk and pronounced than right Joints quite normal looking Fontanelle slightly tenser than before, still level with surroundings Meningitic cry less frequent Throat was no redder than normal, tonsils remained slightly enlarged but not acutely inflamed Heart's action very rapid A few fine moist sounds could be heard all over right lung Abdominal wall quite lax, abdominal reflex absent Liver extended to 1½ inches below costal margin in right nipple line, spleen not palpable The feeds were being taken very badly Stools were greenish yellow, but perianal excoriation much better

At 10 P M on the 11th the child looked very much worse The cry had stopped Fontanelle tense slightly bulging

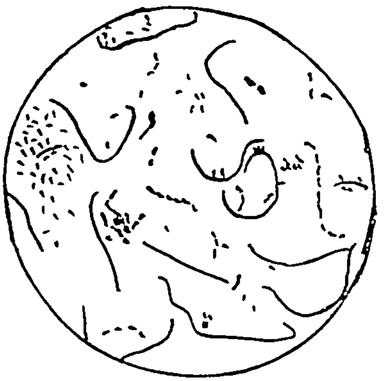
Lumbar puncture gave 15 c c of very turbid fluid, like dilute milk flowing quite freely, under slightly increased pressure A culture from this was put up on blood agar, and sent next day to Dr Panton who as said above confirmed the organism as the bacillus of influenza Globulin and reducing substance not tested for Cells too numerous to be counted On 25 squares of a Thoma hæmocytometer were two masses of 20 to 25 white cells each, and 67 discrete white cells A film showed almost all cells to be polymorphonuclears, very few other types indeed seen Also enormous numbers of influenza bacilli, both isolated and chain forms, almost all extracellular, very few being intracellular

FIG 1.



Cerebro spinal fluid, March 7th 1917 All the intracellular bacilli in the field have been drawn but not all the free-lying ones

FIG 2



Culture from the cerebro-spinal fluid (Not all the bacilli in the field have been drawn)

The child continued in a low state till 2 P M the next day (12th March) when suddenly hyperpyrexia set in, temperature rising to 107 6°

The knee-jerks were sluggish and difficult to elicit Left knee jerk was even then more evident and easily elicited than right Limbs very flaccid No rigidity anywhere Child was absolutely unconscious no cry, diaphragm paralysed Respiration very rapid and thoracic abdominal respiratory movements reversed Sharp moist sounds over both lungs in such abundance that it was impossible to hear the heart Alæ nasi were working very evidently Pulse very small and very frequent Pupils inactive to light and very contracted Neck quite flaccid, fontanelle not tense and level with surroundings

A cold sponge was given without avail The child died about 2 30 P M

A DEVONSHIRE CENTENARIAN —Mrs Jane Welsford, of Newton Abbot, celebrated the 103rd anniversary of her birthday on August 21st

THE LATE DR GEORGE METCALFE —By the death of George Metcalfe, M D, B S Durh the community of Skelmersdale Lancs, has lost a good friend Educated at the Newcastle School of Medicine and St Thomas's Hospital, Dr Metcalfe had practised in Newcastle, Bristol, and Tottenham, and had spent some years as civil surgeon on the Gold Coast, before his appointment in 1905 to the White Moss Colliery Sick and Accident Society at Skelmersdale, where he remained until his death so arranged as to give it a rosette appearance Other types of "sausage" bodies are encountered in the blood of these cases similar in size to the preceding, but whose round or oval nucleus consists of a thin red stained circumference with a single deep-red chromosome at its centre One or other or all of these types of merozoite may be present according to the stage of the disease in relation to the pyrexia, being most numerous just preceding the febrile stage They gradually increase in number up to the height of fever, when they disappear, and the day after the pyrexia none of these forms can be found in the blood, the only form of parasite then present being the parthenogenetic gametocyte This gametocyte can be found in different stages of development according to the time elapsed subsequent to the pyrexial stage, and ultimately just before the rise of temperature gives rise to 20 merozoites

A rough diagram of the cycle of development of this parthenogenetic origin of the merozoites is appended, as during the latent stages of trench fever a diagnosis can be made with absolute certainty by finding any of these characteristic bodies in the venous blood, spleen, or liver Personally I have found spleen puncture the quickest way to establish the diagnosis of trench fever

In brief, this gametocyte of the hæmogregarine of trench fever is a round, oval, or bluntly triangular body in shape, which in the first stages of development is 4–6 μ long by 3–5 μ wide The cytoplasm is stained an intense blue, and is coarsely reticular in specimens stained by Giemsa s method There is a large, diffuse purple nucleus *de reliquat* and at the periphery of the cell there is a dense, deep-red stained nucleus rich in chromatin This is usually situated at an opposite pole to the nucleus *de reliquat* and in the first stages of development it is round, later oval, and then rod shaped As development continues this nucleus divides into two, then four, eight, until when 20 nuclei are formed sporulation commences with the setting free of 20 small merozoites These merozoites at the moment of sporulation are generally 0 75–1 2 μ long, and gradually become larger until the mid stages of pyrexia when they disappear from the venous blood In distinction from the gametocyte of latent malaria (*H vivax* infection) this gametocyte of trench fever possesses no pigment or hæmozoin The size of the gametocyte at the moment of sporulation is 13–15 μ. In addition to this form of development of the merozoites, the micromerozoites develop by a process of schizogony, the schizont when first noted in the liver or blood being an oval purple stained body 5 5 μ long by 4 5 μ broad, the periphery of which is crenated and just within which crenations is a row of small nuclei which completely encircle the schizont

There is also evidence that the merozoites develop asexually with the production of a second type of schizont in the liver In the liver and occasionally in the venous blood what are apparently the gametocytes, or sexual forms, are to be noted The female gametocyte consists of a circular dense ring shaped nucleus with a central chromosome On either side of the nucleus are two semicircular uniform masses of cytoplasm, one of greater transverse diameter than the other The measurements of a typical example are length 5μ width of wider cytoplasmic mass 3 4μ of the smaller 2 2μ, and the diameter of the nucleus 1 7μ The male gametocyte is a round or egg shaped body 3–3 5μ in diameter with a centrally situated nucleus usually with three chromatin masses Both these two bodies are very distinct easily recognised in fresh preparations, and when stained by Giemsa's method the cytoplasm stains an azure blue and the nucleus a very distinct deep red

The fact that this protozoon of trench fever is a hæmogregarine suggests the extreme probability that the *Pediculus corporis*, or what is even more likely that a louse allied to the *Hæmatopinus stephensi* described by Newstead and Christophers as parasitic on the Indian field rat is the carrier of the protozoon The presence of such large numbers of rats in the trenches which come into close association with our troops seems to favour this conclusion An effort is being made to trace out the cycle of sporogony in the stomach cells of the different types of lice commonly present in the under clothing of our soldiers

I would like to take this opportunity of thanking Major Byam, R A M C, to whom I am indebted for bringing together in one hospital the clinical material upon which the present work is being done In addition, I would like to thank Miss Brad and Corporal Haylock, my assistants, for their help in carrying out this research I am also much indebted to Lieutenant Wilson, R A M C, who has clinical charge of these cases, for much help and valuable suggestions

Since writing the above paper I have had opportunities of confirming the presence of the hæmogregarine in a number of other cases of trench fever, and also, in addition, in cases of D A H complicated with some of the clinical signs of P U O and one or two cases of definite benign tertian malaria

In the cases of double infection, with the parasites of malaria and trench fever, a significant feature was the fact that quinine was powerless to subdue completely the pyrexial attacks which we now know were partly due to the protozoon of malaria and partly to the hæmogregarine of trench fever

A CASE OF INFLUENZAL MENINGITIS

BY K S BHAT, M R C S, L R C P LOND,

RESIDENT MEDICAL OFFICER, EAST LONDON HOSPITAL FOR CHILDREN SHADWELL, E

PATIENT, a female child, aged 14 months admitted on March 7th, 1917, into East London Hospital for Children, Shadwell under care of Dr T Fisher The child had then been ill ten days with "bronchitis" and had been treated outside The illness started with a sore-throat, the child had vomited and gone blue in lips on first day of illness It was coughing during five days previous to admission The right shoulder, left wrist, and left ankle joints were noticed to have swollen on the day before admission No tuberculous family history

The child looked obviously ill and semi conscious and not quite intelligent It would not grasp a finger put into its hand It was very restless, jerking the limbs about now and then, and frequently uttering a sharp short cry without apparent external cause Head was strongly retracted and neck rigid, altogether a moderate degree of opisthotonos Arms were adducted over chest, elbows semi-extended, wrists strongly dorsiflexed, fingers bent into palms, and the whole limbs rotated so that dorsal aspects of wrists faced each other Toes bent into soles, ankles hyper-extended Knee-jerks very exaggerated, tending to clonus, plantar reflexes extensor Kernig's sign was very evident in both limbs Supinator jerk present on right side, not looked for on left Abdominal wall lax, abdominal reflex present Lungs quite normal no sign of bronchitis Heart's action rapid, nothing else abnormal about heart or pulse, rate 140, respirations 36, temperature 101° F Spleen not palpable liver one inch below costal margin in right nipple line The abdominal skin was slightly inelastic Pupils reacted normally to light. Fontanelle not bulging The throat was slightly redder than normal, tonsils slightly enlarged The external genitals and perianal region generally were much excoriated Doughy swellings were present in right shoulder, left wrist and left ankle joints, no fluid detected Movement was practically perfect in range but evidently painful and resisted

On account of these swellings, and the evident meningitic condition the child was admitted into hospital with the diagnosis of tuberculous meningitis Lumbar puncture was done soon after admission.

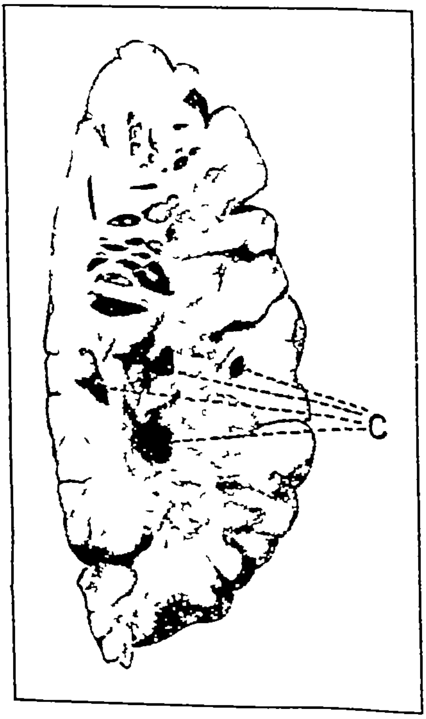
The cerebrospinal fluid was very slightly turbid, under slightly increased pressure Cells 150 per c mm, 54 p c polymorphonuclears, 46 p c lymphocytes In counting these 100 cells 18 "endothelial cells also seen Globulin slightly increased, no reducing substance present The film made from c s fluid for differential count of leucocytes showed typical influenza bacilli in large numbers, both short isolated bacilli and long chain forms These long chain forms were found to consist of the short bacilli joined end to end by a cell membrane This resolution needed an objective of N A 1 4 N A 1 3, and was better shown with an objective of N A 1 4 The bacilli were almost all extracellular, very few indeed being seen within the polymorphonuclears Cultures showed the organism to be a typical bacillus of influenza Subsequently on another lumbar puncture a culture was taken on blood agar and sent to Dr P N Panton, who very kindly examined it and pronounced the culture sent to be "a typical bacillus of the influenza type"

A CASE OF ADVANCED MULTIPLE BRAIN SOFTENING

BY THOMAS WALMSLEY M D GLASG
TEMP. ASSISTANT MEDICAL OFFICER, ROYAL ASYLUM MONTROSE.

THE patient a woman aged 26 was admitted to this asylum for the first time in 1889, two years after her marriage She suffered from left otitis media purulenta, had an offensive vaginal discharge, showed the signs of prolonged alimentary disorder, but her respiratory and circulatory systems were reported normal Her mental state was one of acute excitement of short duration and was accompanied by well marked motor disturbance. She was discharged in eight months' time and was then noted to be an active minded woman acute and penetrative but idle vain, and boisterous and given to the use of coarse language She was readmitted three years later, widowed her husband having died in the interval in this asylum from general paralysis of the insane She again showed signs of alimentary derangement, was anæmic had a slight organic mitral murmur, but had no signs of organic nervous disease She had a dull stupid expression, was with difficulty induced to speak, and gave meaningless and mechanical answers, was degraded in her habits, and had delusions of bodily sensation inclined towards a sexual basis, ' people sitting on her eyelids who tell her to do wicked things ' The development of her condition was rapidly towards a complete dementia but interrupted by short periods of excitement characterised by loud prolonged laughter and in 1913 by two epileptic fits She died in 1916 The notes made shortly before her death indicate that she had become very stout that her extremities were constantly cold and blue her skin dry and harsh that there was no paralysis of her limbs, and that she had cardiac symptoms pointing towards myocardial degeneration Mentally she was in a condition of stuporose dementia, she was unable to initiate the simplest voluntary activity, she remained motionless wherever she was placed, allowed the saliva to dribble from her mouth, always required to be fed, did not attend to her natural needs, in fact she showed a distinct resemblance to the behaviour of a decerebrated frog

FIG 1

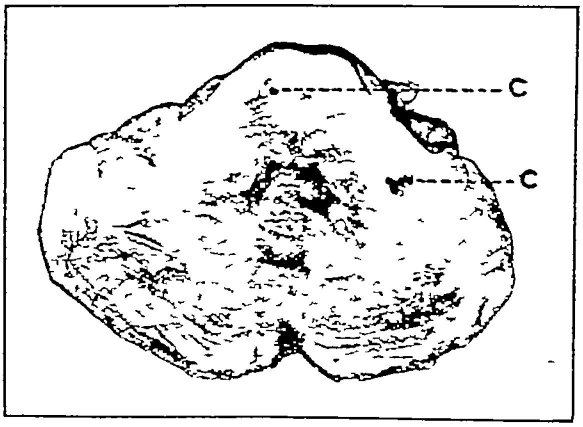


Under view of a section of the cerebrum at the level of the centrum semi-ovale showing cyst cavities (c) of the white matter

A post mortem examination was made on the morning after death There were no signs of localised wastings no marks of injury or of trophic sores on the body There were a few small uterine myomata chiefly subperitoneal The pleuræ and lungs were healthy There was no pericardial disease The heart wall was soft, very fatty and easily torn all the heart valves were thickened and hard though but slightly incompetent The aorta showed patchy atheroma over the arch and at its bifurcation The membranes of the brain were congested, slightly thickened, but without the signs of inflammation, and there were no subdural deposits, the pia stripped readily from the brain surface, the Pacchionian bodies seemed normal There was a great excess of cerebro-spinal fluid, which contained a slight amount (not estimated quantitatively) of albumin The arteries of the brain were normal in their macroscopic distribution, they showed patchy atheroma on their larger branches The convolution system of the brain was normal in amount and not unusual in design, but the whole brain looked atrophic but was without any areas of superficial decortication.

Section of the hemispheres (FIG 1) revealed (bilaterally) numerous cyst cavities, inconstant in size and shape, though in the same brain area tending to have a uniform conformation They were absent from the cerebral cortex, and though a few were present in the basal ganglia they were mostly confined to the white matter and especially numerous towards the anterior end of the brain They extended, however through the mid brain, cerebellum, pons, and medulla (FIG 2) In all the boundary wall appeared to be smooth though not of the nature of an "encystment capsule" The appearances presented in many instances led me to the opinion that the individual cysts had undergone a progressive increase in size and the intervening brain substance having undergone a pressure atrophy neighbouring cysts had become confluent I believe this to be confirmed by the fact that in every instance in which it was possible to make a complete examination of a cyst wall an aperture of communication to the surface of the brain was present, in some cases a mere pin point channel, in others a wide slit opening in the depths of a cerebral fissure In the latter cases it was always easy to determine the line along which the pia mater abruptly terminated and the cyst wall commenced—that is there was no ingrowth of pia into the brain substance I believe however that the cerebro-spinal fluid would enter these cavities and would thus account for their progressive increase in size

FIG 2



Section of pons and cerebellum showing cystic formation c Cyst

Microscopic examination of an affected area showed that the cyst wall was formed of brain tissue, there being no alteration in the density of the peripheral neuroglia and no decrease in the number of peripheral nerve fibres—that is there was nothing in the nature of a lining membrane, and under high magnification the wall appeared rough in the cilia like projections of neuroglia Areas of commencing softening at different stages were also to be observed. In the more advanced the nerve fibres had retained their normal appearances even while the neuroglia has become more or less homogeneous The earliest stages in which there was simply a ' loosening ' of the neuroglial network were found in relation to small thrombosed vessels though other vessels slightly larger as a rule, were to be seen, with thrombosis of long standing and an absence of perivascular softening There was no fibrous disease of any vessel within the brain substance examined and the number of vessels did not seem to be increased So far as I was able to determine, there was a complete absence of a reactionary neuroglial overgrowth. The cortex was everywhere shrunken and its cells were fewer in number than the

A CASE OF PERIODIC ATTACKS OF PYREXIA

By R V SOLLY, M D, M R C P Lond, F R C S Eng,
PATHOLOGIST TO THE ROYAL DEVON AND EXETER HOSPITAL AND TO THE GROUPED AUXILIARY HOSPITALS EXETER

The following is a case of periodic attacks of pyrexia with erythematous eruption in a recruit, which were apparently cured by treatment by means of an autogenous vaccine, followed by the intravenous injection of one dose of galyl

Notes of Case

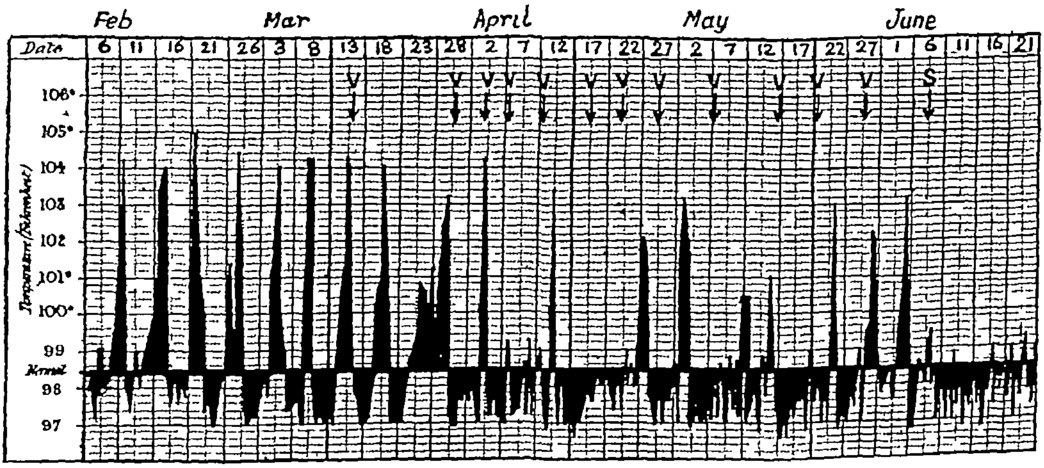
Private M, aged 18, was admitted to No III Temporary Hospital, Exeter, under the care of Lieutenant-Colonel Henry Davy, on Feb 6th, 1917, and discharged to a convalescent hospital near Exeter on July 18th He was in the Army as a recruit only nine days He had been in the Navy for six months, but was discharged, as he was subject to fits He says he had always had good health till he joined the Navy He was sent to the Royal Naval Hospital on June 1st, 1915, and discharged on June 25th He joined the Army in January, 1917, and epileptic fits started again His mother was always in delicate health She suffered from epilepsy from the age of 13 to the time of her death, which was caused by "gastritis, enlarged liver, heart disease, and cancer" Father and sister have good health

On admission the patient's temperature was 105° F, and he was sent in with a diagnosis of pneumonia, but his pyrexia turned out to be only one of the periodic attacks, described below When in the hospital living pediculi (capitis) were found From admission up to March 22nd, practically every five days he had a sudden rise of temperature, up to 104° or 105°, accompanied by pains in the back of the head and limbs and by an erythematous rash on chest, arms, and face These were red, slightly raised patches as large as a half penny There was no itching or burning At the same time the face became distinctly puffy The temperature remained up for 24 hours and then fell as rapidly as it went up When it was falling the patient had attacks of vomiting The pulse during the pyrexia was generally raised to 108–112, between the attacks about 70–90 The patient was otherwise well perhaps somewhat anæmic, except for one or two attacks of epigastric pain Nothing abnormal was detected in heart, lungs, or abdomen

Blood count on March 1st (just after an attack) White cells, 23,000 per c mm Differential count Polymorphs, 91 5 per cent, lymphocytes, 8 per cent, large mononuclears, 0 5 per cent, eosinophiles, none seen

Agglutination tests to *B typhosus* and to *B paratyphosus A* and *B* were carried out with a negative result On two occasions during the attacks of fever blood cultures were performed, and on each a Gram negative bacillus was obtained It had the following cultural characters motile, pleomorphic, caused general turbidity in broth, and grew freely on ordinary agar forming a greyish white confluent growth, with the production of an offensive odour, on potato a dark brown growth It did not liquefy gelatine, though it grew freely at room temperature No acid or gas in glucose, sucrose, lactose, or mannite, and no acid or clot in litmus milk

Chart of a Protracted Case of Periodic Attacks of Fever



V Injections of bacillary vaccine (16 iii, 1 mill 31 iii 2 5 mill 3 and 7 iv 5 mill 12 iv 10 mill 19 23 iv, 5 mill. 29 iv 10 mill 7 16, 22 and 30 v 5 mill) S Intravenous injection of 0 4 gm galyl dissolved in 50 gm distilled water

A vaccine was prepared and several doses given, varying from 1 million up to 10 millions The temperature appeared to have been distinctly modified by the vaccine treatment and on one occasion there was an interval of 9 days without pyrexia, on another of 11 and finally there was an interval with only slight rise of temperature of 20 days However, after this the periodic attacks recurred, and he had three in succession, with the usual intervals, almost as severe as when first admitted so Colonel Davy and I decided to try the effect of an intravenous injection of one of the substitutes for salvarsan, and on June 8th I gave him an intravenous injection of 40 centigrammes of galyl dissolved in 50 c c. distilled water This produced no rise of temperature, and only a slight headache

Since this injection the patient has had no rise of temperature at all and has improved in every way in his general health A Wassermann test was carried out both before the injection and about a week after On each occasion a somewhat weak positive result was obtained, on the last occasion there being somewhat less deviation of complement than the first No further injections of galyl were given, nor has any mercurial or other medicinal treatment been administered

Remarks

I am publishing this case as it stands at the particular request of Colonel Davy, though I do not pretend to be able to say what the cause of the attacks of fever was or to give a name to the condition

In the first place, the temperature appears to have been distinctly modified by the vaccine treatment I do not know what the organism found ought to be called Perhaps it might come under the head of "*Bacillus fæcalis alkaligenes*" Was it a true blood infection or only a contamination?

Looking now at the chart it seems possible that the injections were too frequently repeated, but no definite negative phase was noticed, and the object was by anticipation to prevent the recurrence of the attacks

In spite of the positive Wassermann reaction I cannot imagine that these attacks of pyrexia were due to syphilis, and the high leucocytosis with over 90 per cent of polymorphs is against this Though he had not been out of England or in the trenches, he had been in contact with soldiers and pediculi were found in his head, so that it seemed possible that these attacks might be a peculiar form of "trench fever" possibly due to some unknown spirochæte or protozoon I believe some pathologists (Carnegie Dixon and others) have obtained a positive Wassermann reaction in cases of trench fever, but the effect of injections of salvarsan did not appear to be very conclusive In this case after only one injection given over two months ago, and with no other treatment except previous injections of vaccine, his attacks of pyrexia ceased and he has been well ever since Of course, it is possible that the boy is a congenital syphilitic, and this is perhaps supported by the fact that both he and his mother have been subject to epileptic fits He had not the appearance of a congenital syphilitic patient

Reviews and Notices of Books.

Elements of Hygiene and Public Health By CHARLES PORTER M D Edin With 98 illustrations London Henry Frowde and Hodder and Stoughton 1917 Pp 411 Price 12*s* 6*d* net

THERE exist already so many excellent text-books on hygiene and public health, which are kept up to date by the issue of fresh editions from time to time, that it may at first sight appear doubtful whether there is room for a new book on these subjects The present volume, however, has been written with a definite end in view—namely, to supply the medical practitioner with concise information on only the more important aspects of preventive medicine It deals with personal hygiene as well as public health, and emphasises the importance of a medical man regarding his patient not merely as a person to be rendered healthy but as a being to be kept healthy In view of increasing demand for medical men in the public health service and of the part played by the medical practitioner in any scheme for the prevention of disease, it is surprising that more attention is not devoted to the teaching of public health to our medical students, and that it does not form a more important subject in the medical curriculum We believe that Dr Porter's book will be found useful in supplying information which though untested by examination will be found of great benefit Its careful study either in student days or after graduation, will well repay the medical practitioner for the time thus expended In the sections devoted to the consideration of disease the reader is credited with already possessing fair knowledge of the subject, and attention is chiefly directed to causation and prevention Considerable space is devoted to a review of the more important aspects of sanitary science while statistics and sanitary law are more briefly dealt with, the object being only to provide such information as will enable the medical practitioner to perform his duty as part of the public health service

In a chapter upon occupational diseases and industrial hygiene Dr Porter has succeeded in putting together a large amount of valuable information in relatively small space, but many of the subjects are necessarily treated very briefly, and it is a defect in a serviceable book that too few references are given to sources of information which would enable the reader to pursue his studies further in any particular direction There are a large number of good illustrations, many of which have been specially prepared for the work, and a comprehensive index permits of easy reference

Theophrastus and the Greek Physiological Psychology before Aristotle By GEORGE MALCOLM STRATTON, Professor of Psychology in the University of California. London George Allen and Unwin, Limited, New York The Macmillan Co 1917 Pp 227 Price 8*s* 6*d* net.

WITH the exception of his "Characters," a series of what may be termed in modern language "articles," on various types of men of his day, Theophrastus is almost unknown to the majority of ordinary readers But he was a widely read and highly intellectual man, he wrote treatises upon nearly every department of inquiry of which the names at least have survived in the catalogue drawn up by Diogenes Laertius to the number of some 200 His extant works, besides the "Characters" already mentioned, consist of two botanical works portions of a history of physical opinions and a fragmentary discussion of metaphysical problems He succeeded Aristotle as head of the Peripatetic School at Athens in the year 323 B C, a position he held until about 288

The little treatise on the Senses a complete translation of which has now for the first time been given us in English by Dr Stratton deals not only with the ordinary five senses but in addition with such subjects as pleasure and pain and intelligence The treatise is extremely interesting because it not only contains Theophrastus's own opinions on the subject matter but contains a résumé of his predecessors views together with shrewd criticism thereof The writers with whom he deals are Alcmaeon of Crotona Anaxagoras, Clidemus Democritus, Diogenes of Apollonia, Empedocles, Parmenides, and Plato Heraclitus is just mentioned as belonging to the school which attributed sense perception to contrast Dr Stratton prefaces his translation of and notes to the De Sensibus with a précis of Theophrastus's own doctrine on the subject gathered from the treatise in question and certain of his other treatises, such as the De Odoribus and De causis Plantarum Then follows a chapter on Theophrastus's Method of Criticism in which Dr Stratton fairly sets out the weaknesses as well as the high order of the Greek philosopher's judgments, showing, however that the virtues predominate The remainder of the book is taken up by the translation, with the Greek text and notes, which in many places may be called a commentary, on the same

English readers owe Dr Stratton a debt of gratitude for having provided them with an eminently readable translation of a very interesting treatise In one place we would make a suggestion as to a possible alteration in a note, and that is in section 77, where Theophrastus is dealing with Democritus on colour According to him, says Theophrastus (v p 136) τὸ δε κυανοῦν ἐξ ἰσατίδος κὰι πυρώδους, σχημάτων δὲ περιφερῶν κὰι βελοιοειδῶν, ὅπως τὸ στίλβον τῷ μέλανι ἐνῇ This Dr Stratton translates "Indigo" (that is, the colour not the substance) "is a mixture of woad and fiery red, with round figures and figures needle-shaped, to give a gleam to the colour's darkness" In his note on the passage he says "Indigo is said to show a copper violet lustre when rubbed It is to this aspect that Democritus is, perhaps attempting to do justice" What the Greeks meant by κυανος, from which κυανοῦς is derived, is uncertain, sometimes it obviously refers to a blue enamel, but we would suggest that in this passage Democritus was referring to lapis lazuli, a mineral which although mainly of a beautiful blue colour, often shows sparkles and flakes of pyrites "figures and figures needle-shaped," which gleam through the blue Indigo does show (in the solid state) a coppery iridescence, but to our thinking, lapis lazuli is more compatible with Democritus's description than is indigo Pliny (N H, xxxvii., cap 9) mentions a stone called Cyanos which he says is a kind of jasper with a blue colour, and as Philemon Holland translates, "You shall perceive a certaine pouder in them as it were of gold, and yet not like to that of Saphires, for the Saphire also glittereth with markes and prickes of gold Saphires are likewise sometime blew, yet in no place be they transparent."

Handbook of Physiology By W D HALLIBURTON, M D Lond, F R C P Lond, LL D, F R S, Professor of Physiology, King's College London. Thirteenth edition (being the twenty sixth edition of "Kirkes' Physiology") Nearly 600 figures London John Murray 1917 Pp 930 Price 16*s*

THE appearance of the twenty sixth edition of this book is signalised by a publisher's note which contains an interesting account of its history The first edition was published in 1848 its author being Dr Kirkes, who was at that time lecturer in physiology at St Bartholomew's Hospital During the next 38 years the book passed through 13 editions and underwent considerable change and growth at the hands of its various editors among whom may be mentioned Mr Morant Baker and Dr Vincent D Harris In 1896 the long association of this work with St Bartholomew's Hospital came to an end and Professor Halliburton became its editor Under his ægis the book has passed through 13 more editions and has been remodelled so completely that little trace remains of its original authorship This work therefore has been a familiar figure on our bookshelves for the last 20 years and, as in the case of all old friends criticism of its merits is inevitably influenced by sentiment The truly impartial critic is the student who approaches the book without prepossession and the rapid appearance of one edition after another is the surest evidence of the student's appreciation of its merits

The chief feature of the present edition is the inclusion of the Basle nomenclature For the most part the new names have merely been inserted in brackets after the old ones, but occasionally they have been actually substituted for the old ones The widespread adoption by anatomists of the new nomenclature makes this change almost unavoidable although normal and distributed without definition—evidences of neuronic degeneration

The cerebral lesions in this case I have thought worthy of record on account of their extensive distribution and I am indebted to Dr C J Shaw, physician superintendent of this asylum, for permission to do so They appear to be multiple softenings due to multiple thrombosis of cardio vascular genesis of the "end artery" system of the brain They seem to be without relationship to any possible syphilitic infection but I am unable to describe the condition of the thyroid gland

MEDICAL, SURGICAL, OBSTETRICAL, AND THERAPEUTICAL

A CASE OF CHICKEN POX SIMULATING SMALL POX

BY F C POYNDER, M A , M B , B CH OXON

THE following case may be worth recording in view of the oft-recurring difficulty of distinguishing a chicken pox rash from that of small pox

The patient was about 4½ years old when he had chicken pox early in 1917 He is an idiot with maldevelopment of brain and long standing contractures, and has frequent fits He has had pneumonia more than once, but has survived all his illnesses, though his low vitality is apparently accountable for the character of the chicken pox rash, which strongly resembled that of small pox.

The photographs sufficiently show the character and distribution of the rash

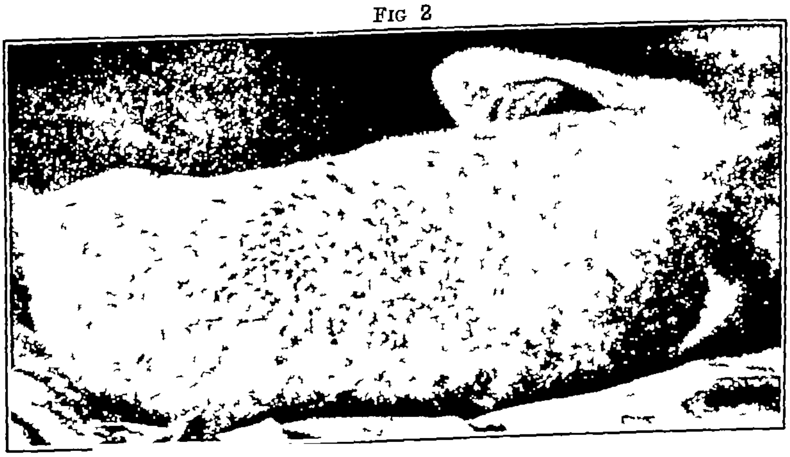
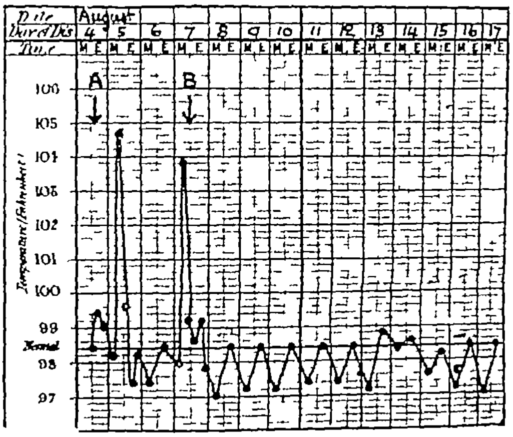
FIG 2



A CASE OF MALARIA ACQUIRED IN ENGLAND

BY S C BISWAS, M R.C S , D P H , D T M & H ,
RESIDENT MEDICAL OFFICER SEAMEN'S HOSPITAL, ROYAL ALBERT DOCK

INTEREST attaches at the present time to the possible acquirement in this country of malaria conveyed from abroad and the following case is published with the permission of Dr C W Daniels, under whose care the patient was



Temperature chart At A benign tertian parasites were found in th blood at B quinine was commenced

A L R , aged 33 years, aircraftsman, R N.A S , wa admitted to the Seamen's Hospital, Royal Albert Dock, o August 6th, with the following history On July 26th whil at Eastchurch, Isle of Sheppey he ha fever, his temperature rising to 103° F he felt hot and he sweated, but had n shivering On July 28th, when in London he had an attack of fever, with shivering &c , and thereafter every alternate da until August 8th this attack was repeated For the last 12 months he has been st tioned at Eastchurch, where he has bee accustomed to sleep in a hut with succe sive batches of men who have served i various parts of East Africa None o these men, so far as he knows, wa actually suffering from fever, but one o them was known to have had malari when in East Africa According to th patient's statement, the hut was so full o mosquitoes that on some nights he coul not sleep The patient has never bee out of England

On admission, his blood was draw from a finger tip, examined, and foun to contain benign tertian parasite mainly gametes The spleen wa enlarged three and a half fingers' breadt below the costal margin There wer no other physical signs and the temper ture was normal Examination of blo on the following day showed beside parasites an increased percentage (16 pe cent) of large mononuclears Th progress of the case in the hospital i illustrated by the accompanying chart which shows two typical tertia paroxysms antecedent to the adminis tration of quinine, and none after H was treated with quinine hydrochlor gr 5 every six hours, from August 7th to 11th, and gr 5 t i d for 10 day subsequently He was also put o tabloid ferri et arseneci co (B W an Co), one t i d , as his spleen was much enlarged

Mosquitoes and chironomidæ have sin been collected from the hut by a frien the patient Among them a specimen o anopheles probably *A maculipennis*, and one of *Culex* (*Culiseta*) *annulatus* can b recognised. These identifications hav been confirmed by Lieutenant-Colone A. Alcock, F R.S

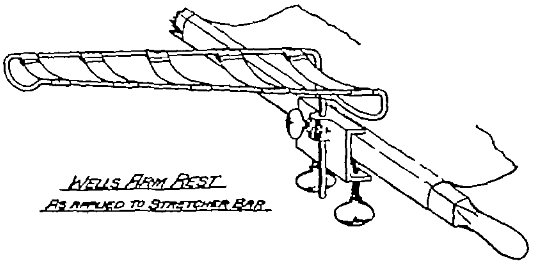
Facts and Fallacies of Compulsory Health Insurance By FREDERICK L HOFFMANN LL D, Statistician, The Prudential Insurance Company of America, Fellow American Statistical Association, Royal Statistical Society, &c *An Address read in part before the* Section on Social and Economic Science of the American Association for the Advancement of Science Dec 28th 1916 and the National Civic Federation, Jan 22nd, 1917 Pp 101

IN a pamphlet which is distinguished by orderly arrangement and lucidity Dr F L Hoffmann examines the existing systems of National Insurance in Europe—that is to say in Great Britain and Germany—with a view to ascertaining how far a similar system, based upon the experience of the nations named, would be likely to prove beneficial if adopted by the several States of America and the Federal Government His investigation is hardly of a judicial character and no doubt he would reply that he did not intend it to be and that his advocacy, directed intentionally against such proposals and suggestions in favour of National Insurance as may be current in the United States could be in no way disguised Nevertheless he has selected statements of facts and of opinion for citation rather too exclusively from the utterances of those hostile to National Insurance, at any rate, so far as this country is concerned, and has contrived to give the impression that nothing is to be said on the other side, and that with us no voice could be raised worth listening to in support of any view different from his own His work in this respect is therefore rather less interesting than are his comparison of social conditions in America with those prevailing here, and his suggestions as to possible social legislation for the national health in his own country

On the whole however he makes out a strong case in favour of the non adoption, or of considerable caution in the adoption, in America of the examples set by us and by Germany, and he is no doubt right in what we are inclined to regard as his main contention which is to be found summarised on p 94 He there says that pecuniary support except during very prolonged sickness ' is not a matter of economic importance to the average American wage worker, more properly concerned with an increase in wages and a decrease in working hours and other matters concerning the maintenance and the raising of his standard of life " Similar tendencies in social and national health development are not unobservable here and are likely to become more conspicuous when peace permits

New Inventions.

AN ARM REST



DURING the present prolonged war much time and thought have been devoted to the preservation of damaged limbs Varied and cleverly contrived apparatus has enabled us to maintain them in comfortable positions, so that the continuity of the shattered bones may be ensured, and no effort spared to preserve the former usefulness of the damaged limb No difficulty therefore has been as yet experienced in this direction, and it is only in regard to the question of transport that any feeling of anxiety arises On board ship I have experienced great difficulty in transferring damaged arms when placed in an extended position, from the ambulance to the ward and *I want to draw attention to the simple contrivance which has made this transference easy on board the* H M A T *St Andrew* The apparatus is very simple light and cheaply produced It can be quickly and securely adjusted for use either on a stretcher, a ship s cot, a train bed or hospital bed After months of use I can confidently recommend it The arm rest may be obtained from Messrs Arnold and Sons, Giltspur street, London E C

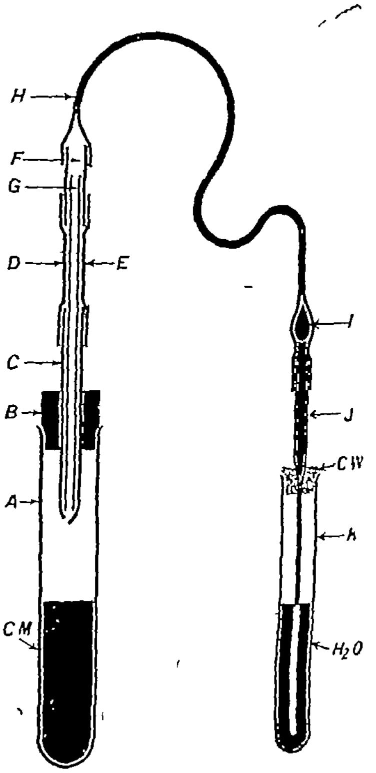
APPARATUS FOR THE ISOLATION AND CULTIVATION OF ANAEROBES

To simplify the cultivation of anaerobes, the apparatus here illustrated has been fitted up

To expel the air, the apparatus is heated in the autoclave Air and *steam escape* through the cut (E) in the rubber tubing (D) (Bunsen's valve) When the apparatus cools the steam condenses and atmospheric pressure closes the slit and prevents air entering At the same time water *rises in the* pipette (J) as far as the glass bead (I) To inoculate the culture tube (A) an emulsion of the material to be cultivated is made in a tube of recently boiled broth or saline, and the end of the pipette (J) is placed in it and the rubber round the glass bead (I) is made oval by pressure with the finger and thumb When the fluid has entered the large tube, the pressure is relaxed



A, Test-tube containing culture medium (CM) B Rubber cork with glass tube (C) D 3-in good rubber tubing with longitudinal slit ½ in long (E) made by a sharp knife (exit valve) F Glass tubing G Glass tube or rod to give rigidity to D H Rubber tubing collapsed on account of vacuum in A I Glass bead to occlude H (inlet valve) J Pipette occupied by water from K after the whole apparatus has been autoclaved CW Cotton wool.

If it is desired to isolate the various species of bacteria in a mixture agar is used instead of broth for the culture medium in the large tube This is melted, and before solidifying is *mixed* in the manner above described with the emulsion The agar is then sloped or distributed over the walls of the tube by gentle rotation.

Anaerobic blood cultures can be made direct from a vein by substituting a hypodermic needle for the pipette

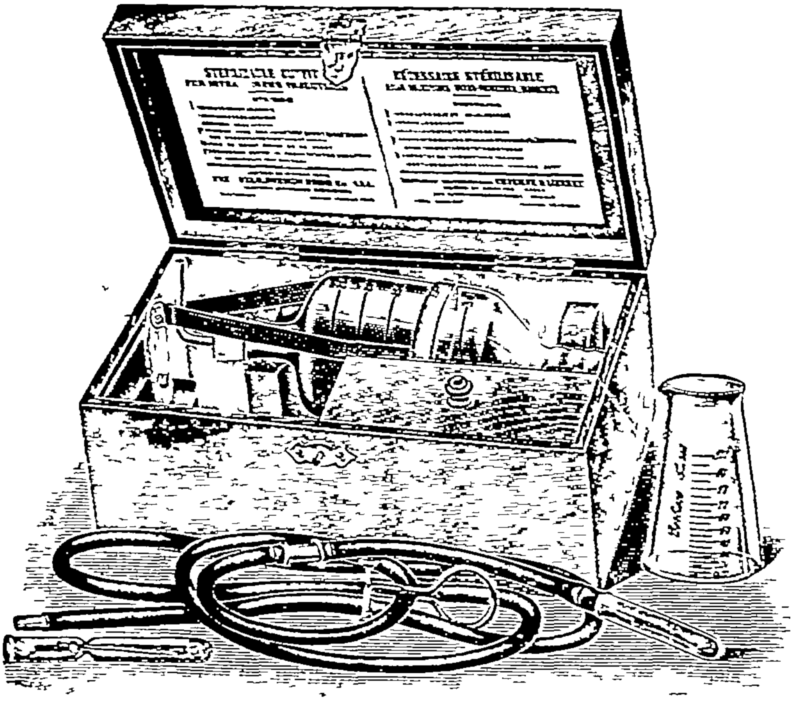
containing

- 1 250 c c. Graduated Ampoule and rubber stopper and glass tube
- 1 100 c c Graduated Measure.
- 1 Suspension Strap
- 1 Descending Tube with index and glass nozzle fitted with short *bevelled steel* needle
- 1 ½oz. bottle Iodeol for sterilizing puncture area



- 1 Packet Silver Threads for the needle
- 1 Plated Tube-clip to regulate flow, workable with one hand
- 1 Glass stirring rod.
- 1 Glass Funnel for filtering
- 1 Packet Sterilized Cotton-wool

Price, complete as above, 37/6
(Special Platinum Needle 8/6 extra)

RECURRENT FEVER
SYPHILIS

GALYL

FRAMBŒSIA AND
SLEEPING SICKNESS

Forms

FOR INTRAVENOUS INJECTIONS — (Fig 1)

(1) **DILUTE** —GALYL is supplied in neutral glass ampoules containing the necessary dose of Sodium Carbonate sterile distilled water only being used for the dissolution

(2) **CONCENTRATED** —A special outfit containing one dose GALYL one ampoule sterilized solution and one small filter is supplied

DOSES
0 10—0 15—0 20—0 25—0 30—0 35—0 40

(3) FOR INTRAMUSCULAR INJECTIONS

GALYL is supplied in **OILY EMULSION**

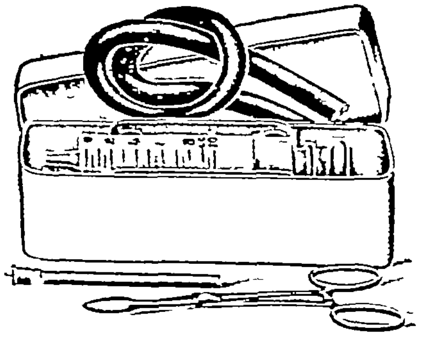
DOSES
0 10—0 15—0 20—0 30—0·40

LITERATURE AND CLINICAL REPORTS ON REQUEST

POCKET CASE.

Containing the entire instruments (sterilizable) necessary for administering a concentrated intravenous injection of GALYL or other solution —

- 1 Indiarubber tube for constricting the arm
- 1 Clamp for fixing the rubber band
- 1 Glass Syringe of 10 c c. capacity



- 1 Platinum iridium Needle, length 4 cm diameter 0·9, with short bevelled joint and special barrel Attachable to the syringe without any additional junction.
- 1 Nickel plated Case to hold all the above
- 1 Chamois Leather Pouch.
- 1 Glass Filtering Tube with rubber attachment

Price complete - - - - 30/-

A GREAT ADVANCE IN THE TREATMENT OF BURNS

SLIGHT or SEVERE.

BURNS
VARICOSE ULCERS
RHEUMATISM
NEURITIS

AMBRINE

GOUT
NEURALGIA
CHILBLAINS
SCIATICA

(The only Authorised Preparation of Dr Barthe de Sandfort Various Imitations compel us to make this statement)

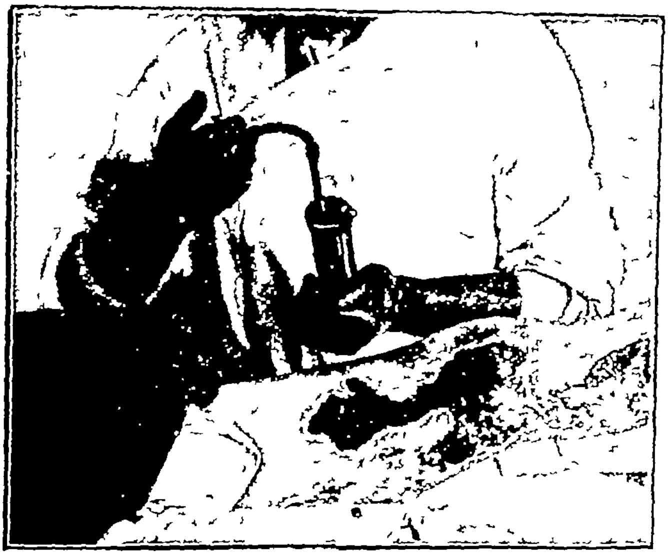
AMBRINE instantly alleviates pain, promotes rapid healing, forms a sure Protection against Infection of the Wound

Although the dressing with AMBRINE is occlusive and adhesive, it becomes after a short period non-adhesive, and can be removed without pain, hæmorrhage, or injury to the newly forming tissues The healing *takes place without leaving scars or contraction*

The BRITISH MEDICAL JOURNAL,
Sept 2nd, 1916 —

Re AMBRINE TREATMENT

" The primary and quite incontestable advantages of the treatment are two: it is agreeable to the patient, because entirely painless it is convenient to the *surgeon* because easily and quickly applied It is possible that the treatment would be useful in dealing with ordinary ulcers and in any *case it is certain that the* study of its application to the raw surfaces is worth pursuing



THE LANCET,
June 10th, 1916 —

THE VALUE OF AMBRINE IN THE TREATMENT OF WOUNDS

Attention is being drawn *to the remarkable success of* the Ambrine Wax treatment now being used at the Hôpital St. Nicolas at Issy-les Moulineaux for burns *frozen* feet and all wounds where the tissues have been so damaged as to exact great length of time and considerable disfigurement in their restitution by the usual means The *Minister of War* in reply to the Deputy M Mons as to why in view of the marvellous results *obtained by treating* burns and frost bites with Ambrine at the Hôpital St *Nicolas, all the soldiers suffer*ing from such wounds were not sent there, stated that this was being done as far as possible "

The most efficient means and method of ensuring active **Hyperthermal-Therapy** to the practical treatment of **Rheumatism, Gout, Arthritis, Neuralgia,** and similar affections

May be applied with camel hair brush, but our specially designed spray greatly facilitates the application of Ambrine, especially in the case of deep wounds or extensive surfaces

---

RATIONAL TREATMENT OF CONSTIPATION

By the double action of secretions and peristalsis

OPOLAXYL

Opolaxyl is a combination of the secretions of the liver (biliary), pancreas and intestines, with vegetable extract of a non drastic nature

It combines all the secretions to correspond to nature's therapy and promotes a flow of bile and glycogen with their hæmatopoietic and antitoxic properties

It is a normal regulator of the gastro intestinal functions, consequently it improves the metabolic exchanges in the entire organism

Opolaxyl *does not* lose its efficacy by prolonged use, its effect is gentle and constant without irritation It is not merely purgative, it stimulates the defective organs and *revives* the normal equilibrium, it has a lasting effect because it restores the organs, thus correcting diminutional function

Opolaxyl is put up in small size tabular *form* easy to swallow, and *should* be *swallowed* without crunching at bedtime or before breakfast.

DOSE —For obstinate constipation 2 or 3 tablets afterwards 1 tablet every 3 or 4 days for a month

The Etiology of Some Obscure War Diseases

THE association between war and pestilence is proverbial, and it is one of the triumphs of medicine that in this greatest of wars we have been spared grave epidemics A comparison between the mortality from wounds and disease in this war and in the South African War gives a measure of the unchallenged advance of preventive medicine But fresh forms of disease have called for increasing vigilance and research Some of these have been widespread, yet of low mortality—for instance, epidemic nephritis, almost unknown in warfare, except in the American Civil War, has been prevalent in France, though absent from the British training camps The immediate death rate of this nephritis has been small, but it is too early yet to gauge the ultimate damage which has been accomplished by the disease Probably it is due to an infection, but, unfortunately, the organism is still unknown, and while this is so no effective means of prevention can be adopted In spite of this there is good ground for believing that, as in the later phases of the American Civil War, epidemic nephritis is gradually diminishing In every war indeterminate fevers have abounded In South Africa we heard much of "simple continued fever," which in the majority of cases was probably merely a mild form of typhoid fever, for in uninoculated patients the Widal reaction was generally found to be positive The absence of this type of simple continued fever now is correlated with the control that has been acquired over typhoid fever and its congeners But from the medley of irregular pyrexias, myalgias, rheumatisms, and "influenza" the features of a definite disease have been gradually recognised and labelled trench fever The headache, drowsiness, and pains in the shins were associated with a relapsing fever, the course of which suggested the activity of a hæmatozoon. The work of Captain J W McNEE and Lieutenant A RENSHAW[1] showed that there was something in the red corpuscle of infected persons which was capable of conveying the disease to others, but no actual organism was found, although the punctate basophilia found was the subject of remark On another page we print an interesting and important communication from Captain LYN DIMOND which points to the presence of a hæmogregarine as the cause of this form of relapsing fever The blood from cases of trench fever was hæmolysed by the addition of a saponin, after which the parasite could be found moving in the centrifugalised deposit The hæmogregarine was also discovered in the liver, and less constantly in the spleen and lung, rarely in the lymphatic glands and not in the cerebro spinal fluid Spleen puncture was found to be the quickest way to establish the diagnosis The broad facts of the life cycle of the parasite appear to be established A day or two before the onset of pyrexia macromerozoites are found free in the plasma of venous blood, and micromerozoites, which are more commonly encysted These merozoites increase in number up to the height of the fever when they disappear, and the day after the pyrexia only the parthenogenetic macrogamatocyte can be found, which undergoes division into 20 macromerozoites just before the rise of temperature, when sporulation occurs This is the asexual generation, but the main features of the sexual generation have also been observed

If further investigation confirms the suggestion that the protozoon of trench fever is a hæmogregarine, it becomes highly probable that either the *Pediculus corporis* or a louse allied to the one parasitic on the Indian field rat, is the carrier of the protozoon The association of this fever with trench life, where large numbers of rats come into close association with the troops, favours this conclusion Trench fever is not dangerous to life, but it is a cause of considerable suffering and much incapacity It is probably one of the various infections and intoxications which lead to disordered action of the heart, and thus is responsible for much prolonged disablement Its effective treatment is accordingly a matter of much importance, and so far nothing has been found to cut short its course The case recorded by Dr R V SOLLY in another column in which the character of the fever raised a suspicion of trench fever, was cut short by a single dose of galyl, although other observers have had negative results with the same drug Special interest therefore attaches to Captain DIMOND s observation that trypaflavine slows the movements of the parasite *in vitro*, and has given good clinical results when administered intravenously The growth of our knowledge of trench fever is a typical example of the steps by which such problems are solved Similar steps are well illustrated in our knowledge of certain nervous diseases For instance, "locomotor ataxy" describes a symptom, "tabes dorsalis" correlates this with an anatomical lesion But a great advance was made when this lesion was traced to a parenchymatous degeneration of the lower sensory neuron produced by syphilis In trench fever the stages have been the recognition of certain scattered symptoms as due to some common cause—then the recognition of this cause as a specific infection, and, finally, the identification of the responsible parasite It emphasises, again, the importance of studying the etiology of disease and the way in which the centre of interest is shifting from the wards to the laboratory

This is further brought out by another paper in our present issue on a form of purulent bronchitis by Captain A ABRAHAMS and others We previously published a communication on this subject from one of our base hospitals in France, so that the disease is evidently widespread.

similar reproach In America, and probably also in Japan, a more impartial view is obtained of the medical productions of Europe in general As in France, so here the scientific habit of mind has not run to the production of a Central blatt In this country only the *Journal of the Chemical Society* has carried out anything like a systematic abstraction of the scientific work of all countries in its own department of science It is a work which cannot be left to a few diligent but limited officials, but requires the close attention of the foremost intellects of the scientific world, and it is, we believe, on these lines that the chemical abstracting is done The unwisdom of refusing to recognise credit where credit is due is accepted by the Chemical Society, and appears in the fact that the excerpts from German chemical literature are as complete and as carefully done as they have ever been Non tendencious abstracting requires a generous mind as well as a wide knowledge of the subject in hand, and is justified in the long run by the confidence of fair minded readers Medicine deserves an inclusive compilation on similar lines International conferences and the like have in recent years rendered the medical and surgical practice of civilised countries, if not uniform, at all events capable of expression in common terms It should not be outside the genius of a capable body of medical abstractors to condense with fairness and impartiality the main foreign scientific work, and in so doing to detect originality at an early stage and indicate fruitful lines for others to follow up Originality is doubtless not less exceptional in medicine than in other faculties, but enterprise may not have been as carefully cultivated, and in the *lutte scientifique* which Professor LENOSSIER assures us is to follow the war this quality will stand us, too, in good stead

'Ne quid nimis.'

SCIENTIFIC AND INDUSTRIAL RESEARCH

THE Report of the Committee of the Privy Council for Scientific and Industrial Research for the year 1916-17 was issued last week, and in it the Advisory Council state 'We have made progress The establishment in December last of a separate Department of State entrusted with the organisation of scientific and industrial research has brought encouragement to the efforts of the Committee and the necessary financial support Progress however is admittedly slow, for the calls of war continually grow and the numbers available for other work, though important, continually shrink During the year the members of the Council have addressed themselves in the main to the organisation of industrial research firstly because they felt the paramount importance of arousing and securing the interest of manufacturers in the application of science to industry and secondly because the influence of the war has created in industry an atmosphere conducive to the growth of new ideas, while it has also impeded the prosecution of work in pure science. In the first part of the report the Council allude to the steps which they have been able to take during the past year to organise a systematic approach to the problem of industrial research on a coöperative basis wherever this method of finance is practicable, the State Department itself helping in those important fields of work which call for independent State action The report discusses the necessary part played by surveys in the work of research, as well as the limits within which the responsibility for them should rest with the *Department*, evidently the position has been carefully considered In the second part of the report the progress made in a number of sporadic investigations aided and initiated by the Department is described After the war the number of research workers both in pure science and technology will in all probability be greatly increased, and it is good to learn that the best means of encouraging inventors and aiding individual manufacturers are receiving the attention of the Committee

WOUNDS OF THE CHEST WALL AND LUNG

APART from a simple thoracotomy, the surgery of the chest has been until recently hardly more than the occasional task of the specialist, and the whole region of intrathoracic operation was summed up not long ago in a treatise of no great size by two specialist surgeons of Bonn There has been a not unnatural hesitation in interfering at close quarters with the central mechanism of circulation and respiration, and only extreme urgency has induced the general surgeon to handle the lung in exceptional cases But the rifle bullet and the shell fragment have had no such fine feeling, and where they lead the surgeon must follow, with the result that a new chapter in war surgery is being written. Obviously a large proportion of shell wounds of the chest are likely to be immediately fatal from shock or hæmorrhage before any kind of help is available On the other hand, perforation of the chest and lung by a high velocity rifle bullet may be a very simple affair But between these extremes there has been opened up a wide field in which the skill and discrimination of the surgeon counts for much, and we welcome the important contribution to the subject by Lieut Colonel T R Elliott, which we publish at the front of this issue Colonel Elliott deals in the first half of his paper with the after histories in the United Kingdom of 170 cases of chest wound seen by himself during the first two years of war at a base hospital in France These patients were transferred to England generally in the third week after their injury, and having arrived safely at this stage, they practically all survived, and in a very large proportion of cases were able to resume duty again within a few months In the absence of sepsis—that is to say, in about three quarters of the cases—the results appear to justify neither the removal of a retained projectile nor the tapping of a hæmothorax unless of large size These points are suggestive and demand confirmation The second part of Colonel Elliott s analysis dealing with the mortality among chest wounds in France, records the experiences of French as well as of English surgeons, amongst whom he specially mentions Dr Pierre Duval, officer in charge of Auto ch r (i e , Ambulance Chirurgicale Automobile) No 21, whose monograph on "Les Plaies de Guerre du Poumon ' has just been published by Masson et Cie, Paris Colonel Elliott states that the impression

Unfortunately the mortality is high—of the cases reported from France the death rate when the epidemic was most severe was 45 per cent, while that of the Aldershot cases was 25 per cent The chief clinical features would appear to be the characteristic expectoration of yellowish green masses of pus which may be the first symptom, the rapid respirations, the extreme tachycardia, the marked cyanosis, and an ante mortem drop of temperature, an evidence of the extreme toxæmia The morbid anatomy of the lung shows the bronchioles to be completely obstructed with pus, catarrhal cells, and débris, with small round cell infiltration immediately surrounding them The alveoli are usually very little affected, and though there may be a secondary broncho pneumonia this is not characteristic of the disease The other lesions found are evidences of toxæmia and of failure of the right side of the heart Treatment has not been satisfactory The early recognition of the case by the character of the sputum is of primary importance, for if the patient is allowed to struggle against the disease at the beginning the outlook is made much worse If cyanosis supervenes the prognosis is grave Both sets of observers are agreed as to the etiology of the disease—it is primarily influenzal—Pfeiffer's bacillus seems to be constantly present But there is usually a mixed infection, pneumococci being the organism most frequently associated with the influenza bacillus It may be asked why, with two such well recognised organisms, should we meet with a new and dangerous form of bronchitis? The suggestion is that it is an example of exaltation of virulence by symbiosis The pneumococci found in the earlier stages are of low virulence, but the two organisms stimulate the virulence of each other, and the fatal termination is by a pneumococcal septicæmia. So that the symptom of an "acute suffocative catarrh" is traced to an obstruction of the bronchioles by purulent exudate with peri bronchial infiltration as its anatomical basis, and this in its turn is traced to a double infection, apparently with true symbiosis Certainly investigations of the etiological factor in these two diseases, trench fever and purulent bronchitis, have yielded results full of interest and promise

◆

Originality and Enterprise the Value of Publicity

IN an article on the opening page of the *Paris Medical*, which is so usefully given up to a broad presentment of current topics, Professor G LENOSSIER, of Lyons, discusses the relationship of French science, and especially of medical science, to the outside world France, he says in effect, is not making that impression on contemporary science or contemporary medicine which is fairly due to her originality French scientific work is annexed on its appearance by groups of workers who diligently follow it up on the lines of the originator without giving him the credit to which he is entitled, and who often, indeed, find some defunct Herr Professor on whom the posthumous honour of the discovery is laid For every five French men who do original work Professor LENOSSIE complains that there are one hundred Germa who accumulate documents The Central Empir are the home and have a monopoly of the Centra blatt to which all the world turns for a summary original work wherein, with immense diligen and a little bluff, Germany is enabled to take cred for vast scientific production and for conferring the rest of an admiring world the hygienic a scientific blessings enjoyed by the Fatherland number of French journals, Professor LENOSSI tells us, have replied by ceasing themselves to pri abstracts of German articles In this ostrich li course he sees only a poor imitation of the metho of the adversary, preferring himself rather dispense both with obscurantism and bluff, and to organise the home scientific army as to car a frank and honest campaign over into ener territory, to that enemy's discomfiture and t approval of onlooking neutrals

And this course French medicine and surge have been taking to some effect in the publicati of an admirable series of war monographs in t Horizon Collection, the dissemination of whi among the English speaking people of Europe a America has been assured by the translations p pared by the University of London Press under t general editorship of SIR ALFRED KEOGH T views expressed are those of first rate Fren authorities, speaking from extensive practi knowledge which cannot fail to serve as a valua asset to the less experienced, enabling them derive the utmost value from the experien which will in time be theirs The predominat note of the series is the exhaustive, practical, up to date manner in which it is handled, along w a clearness of view and logical sequence of thou eminently characteristic of the French genius Gr as have been the advances through all departme in enterprise and activity during the war, the progr made by the medical branch may fairly challe comparison with that in any other, and among assistance rendered by our great ally to the comm cause SIR ALFRED KEOGH finds this brilliant con bution to professional knowledge by no me the least Here then is propaganda in Profes LENOSSIER'S sense—the ensuring of wide publi to work of talent and promise, done for the furth ing of the object in view and not with any alte motive These admirable monographs, many which we have already briefly reviewed, will acc pany the military physician and surgeon now when he returns to his peaceful pursuits, and names of the authors will remain fixed in memory Such honest and effective propaga can hardly miss its mark

But the idea of the *Central* blatt, or respons and inclusive abstraction of contributions references and bibliography, is in itself n bad one Those who read German medical b are constantly struck by the fact that refere are almost exclusively made to German work when others are included the reference is indi through abstracts made in one or other of the principal German medical journals Our medical literature is by no means free fro similar reproach In America, and probably also in Japan, a more impartial view is obtained of the medical productions of Europe in general As in France, so here, the scientific habit of mind has not run to the production of a Central blatt In this country only the *Journal of the Chemical Society* has carried out anything like a systematic abstraction of the scientific work of all countries in its own department of science It is a work which cannot be left to a few diligent but limited officials, but requires the close attention of the foremost intellects of the scientific world, and it is, we believe, on these lines that the chemical abstracting is done The unwisdom of refusing to recognise credit where credit is due is accepted by the Chemical Society, and appears in the fact that the excerpts from German chemical literature are as complete and as carefully done as they have ever been Non tendencious abstracting requires a generous mind as well as a wide knowledge of the subject in hand, and is justified in the long run by the confidence of fair minded readers Medicine deserves an inclusive compilation on similar lines International conferences and the like have in recent years rendered the medical and surgical practice of civilised countries, if not uniform, at all events capable of expression in common terms It should not be outside the genius of a capable body of medical abstractors to condense with fairness and impartiality the main foreign scientific work, and in so doing to detect originality at an early stage and indicate fruitful lines for others to follow up Originality is doubtless not less exceptional in medicine than in other faculties, but enterprise may not have been as carefully cultivated, and in the *lutte scientifique* which Professor LENOSSIER assures us is to follow the war this quality will stand us, too, in good stead

"Ne quid nimis"

SCIENTIFIC AND INDUSTRIAL RESEARCH

THE Report of the Committee of the Privy Council for Scientific and Industrial Research for the year 1916–17 was issued last week, and in it the Advisory Council state "We have made progress" The establishment in December last of a separate Department of State entrusted with the organisation of scientific and industrial research has brought encouragement to the efforts of the Committee and the necessary financial support Progress, however, is admittedly slow, for the calls of war continually grow and the numbers available for other work, though important, continually shrink During the year the members of the Council have addressed themselves in the main to the organisation of industrial research, firstly because they felt the paramount importance of arousing and securing the interest of manufacturers in the application of science to industry, and secondly because the influence of the war has created in industry an atmosphere conducive to the growth of new ideas, while it has also impeded the prosecution of work in pure science In the first part of the report the Council allude to the steps which they have been able to take during the past year to organise a systematic approach to the problem of industrial research on a coöperative basis wherever this method of finance is practicable, the State Department itself helping in those important fields of work which call for independent State action The report discusses the necessary part played by surveys in the work of research, as well as the limits within which the responsibility for them should rest with the Department, evidently the position has been carefully considered In the second part of the report the progress made in a number of sporadic investigations aided and initiated by the Department is described After the war the number of research workers both in pure science and technology will in all probability be greatly increased, and it is good to learn that the best means of encouraging inventors and aiding individual manufacturers are receiving the attention of the Committee

WOUNDS OF THE CHEST WALL AND LUNG

APART from a simple thoracotomy, the surgery of the chest has been until recently hardly more than the occasional task of the specialist, and the whole region of intrathoracic operation was summed up not long ago in a treatise of no great size by two specialist surgeons of Bonn There has been a not unnatural hesitation in interfering at close quarters with the central mechanism of circulation and respiration, and only extreme urgency has induced the general surgeon to handle the lung in exceptional cases But the rifle bullet and the shell fragment have had no such fine feeling, and where they lead the surgeon must follow, with the result that a new chapter in war surgery is being written Obviously, a large proportion of shell wounds of the chest are likely to be immediately fatal from shock or hæmorrhage before any kind of help is available On the other hand, perforation of the chest and lung by a high velocity rifle bullet may be a very simple affair But between these extremes there has been opened up a wide field in which the skill and discrimination of the surgeon counts for much, and we welcome the important contribution to the subject by Lieut Colonel T R Elliott, which we publish at the front of this issue Colonel Elliott deals in the first half of his paper with the after histories in the United Kingdom of 170 cases of chest wound seen by himself during the first two years of war at a base hospital in France These patients were transferred *to England* generally in the third week after their injury, and having arrived safely at this stage, they practically all survived, and in a very large proportion of cases were able to resume duty again within a few months In the absence of *sepsis—that* is to say, in about three quarters of the cases—the results appear to justify neither the removal of a retained projectile nor the tapping of a hæmothorax unless of large size These points are suggestive and demand confirmation The second part of Colonel Elliott's analysis, dealing with the mortality among chest wounds in France, records the experiences of French as well as of English surgeons, amongst whom he specially mentions Dr Pierre Duval, officer in charge of Auto chir (i e, Ambulance Chirurgicale Automobile) No 21, whose monograph on "Les Plaies de Guerre du Poumon" has just been published by Masson et Cie, Paris Colonel Elliott states that the impression is gaining ground that chest wounds are more fatal than was at first supposed Whatever this mortality may be, the deaths almost all occur in the first month No figures, he says, have been collected for deaths from hæmorrhage and severe injury in our field ambulances, but it is probable that 10–15 per cent may die in medical units from the severity of their injury and a further 10 per cent at the casualty clearing station from complicating sepsis Médecin chef Duval, from an analysis of nearly 3500 hospital cases, agrees in giving the general mortality at 20 per cent, reaching 25 per cent or more of the cases retained at the *postes de secours* The first day accounts for at least a third of the deaths, the first and second for nearly two thirds Both observers find the mortality largely influenced by the nature of the projectile, for the battles of the Somme Duval places the percentage death rate for rifle bullets at 5–15, for other missiles 25 Lung wounds with a closed chest wall were fatal in 15, with an open wound in 27 per cent of cases Both the French and English authorities recommend an early cleansing operation as a preventive measure against the appallingly high death rate of infected chest wounds treated conservatively Colonel Elliott mentions two surgeons whose pioneer work has already shown that these thoracic operations are practicable under military conditions in the field Médecin chef Duval suggests, as an alternative, rushing the cases down to the clearing station after applying a simple occlusive dressing, his book contains a full exposition of the methods he uses, and of recovery in cases which might well have been considered hopeless This chapter of war surgery is as promising in its possible results as it is new and fascinating in its practice

THE MEDICAL EXAMINATION OF AVIATORS FOR THE AMERICAN ARMY

THE United States is rapidly preparing a stupendous addition to the air forces of the Allies 30,000 aeroplanes with the requisite men is the smallest figure mentioned, and this number might be sufficient to have a decisive effect on the war The pioneer of aviation, Wilbur Wright, asserts that if the United States could put 10,000 aeroplanes into immediate service the war might be brought to an early conclusion In the *Cleveland Medical Journal* for August Dr W B Chamberlin has described the medical examination of recruits for the American air service, which is characterised by that thoroughness and sagacity which we have learnt to expect from our new ally in all her preparations for war For the air service she is demanding practically the perfect man He must have had two years' college work or its equivalent In addition to the usual physical requirements he must have perfect hearing and sight without the aid of glasses Still more important, he must have a correct sense of equilibration Without this a man might easily be eligible for almost any branch of the Army service Up to the present the tests for aviators in America have been crude The United States is probably the first great Power to call in experts outside the Army Medical Corps to formulate tests Her requirements to day are more rigid and exacting than those of any other nation Man's knowledge of his position in space is gained from three sources —muscle sense, eyesight, and vestibular apparatus The importance of the latter to the aviator is great because under certain conditions he receives little help from the two former Seated in his machine he receives small aid from his muscle sense, while his frequent passage through clouds or at night in complete darkness may deprive him of the sense of orientation gained through the eyes He has become for the moment the bird flying through fog or mist or the bat flying by night He must depend entirely upon a sense of equilibration given by an unimpaired vestibular apparatus The American recruit is therefore put through Barány's tests Seated in the revolving chair with eyes closed and head tilted 30° forward (bringing the horizontal semicircular canals into the plane of turning) he is revolved 10 times to the right in 20 seconds When the chair is brought to rest and vision directed on a distant object horizontal nystagmus to the left should occur for 26 seconds. A variation of 8 seconds more or less is allowable The test is then repeated in the opposite direction Pointing is then tested. If the normal individual, with eyes closed, extends his arm straight before him and touches the examiner's finger he can bring his arm to the perpendicular and again touch the examiner's finger without deviation to the right or left This test is made for both the right and left arm The recruit is now turned 10 times to the right When the turning has ceased he is directed to touch the examiner's finger and touch it again after bringing the arm to the vertical He will now point several inches to the right This is called "past-pointing" The normal subject will past point three times to the right and then again point correctly The test is made with both arms It is then repeated after turning to the left If the recruit past points more or less than three times he is rejected The vertical semicircular canals are tested by inclining the head 90° forward, thus bringing them into the plane of turning, and the recruit is turned 5 times to the right in 10 seconds On raising his head or body to the vertical it inclines to the right The recruit is then turned to the left and the test repeated Failure in these tests means rejection In borderland cases resort is had to Barány's caloric test

POLIOMYELITIS IN ENGLAND A REVISED MEMORANDUM BY THE LOCAL GOVERNMENT BOARD

IN view of the recent occurrence of cases of acute poliomyelitis in a number of different districts in England, the issue by the Local Government Board of a revised Memorandum on the disease is opportune The Memorandum contains an up to date résume of the chief characteristics of the malady, together with valuable suggestions on preventive measures It is recommended that sanitary authorities should be prepared to give facilities for the examination by competent bacteriologists of materials derived from the sick Stress is laid on the importance of lumbar puncture being performed as early as possible in acute cases where there is doubt in the diagnosis between cerebro spinal fever and poliomyelitis In the former the presence of the meningococcus is characteristic of the disease, in the latter this organism is never found in the spinal fluid, but there is in the fluid an excess of lymphocytes The importance of early serum treatment of cerebro spinal fever is another argument in favour of lumbar puncture being performed in all doubtful cases where the possibility of this disease cannot be excluded by other methods of diagnosis As poliomyelitis can be recognised by histological examination of the affected portion of the cord, such examination should be made in fatal cases in which there is a suspicion that it was the cause of death Pieces of the cervical and lumbar enlargements, if not the whole cord, should be forwarded in 10 per cent formalin to a competent pathologist It is intimated that the Board is prepared for the present to examine specimens of cerebro spinal fluid or spinal cord, addressed to the Medical Officer, Local Government Board, and forwarded in accordance with the regulations of the Post Office Active coöperation between the medical officer of health and the medical practitioners in a district facilitates administrative control over poliomyelitis, and, in view of the difficulty in diagnosing certain forms of the disease, medical practitioners should be invited to confer with the medical officer of health as to cases of anomalous illness All cases of poliomyelitis should be isolated, and if this cannot be done under proper conditions at home the patient should be treated in an isolation hospital As it has been shown that the virus may be present in the nasal mucous membrane, an antiseptic solution should be applied by means of a spray to the throats and nasal passages, not only of the patients, but of all persons brought into contact with them A 1 per cent solution of peroxide of hydrogen or permanganate of potash, 1 2000 in 0 8 per cent solution of chloride of sodium, can be used as a throat wash and gargle All discharges from the patient and all articles soiled by such discharges should be immediately disinfected, as well as the sick room and its contents at the end of the illness Those closely attending on the sick should avoid any contact with others, especially with children, which might lead to infection, and no child from an infected family should be allowed to attend school A form of inquiry has also been prepared by the Local Government Board which will, in future, be sent to each medical officer of health reporting a case of poliomyelitis to the Board in the weekly returns of infectious disease It is hoped that this form may be useful to medical officers of health in making their own investigations regarding cases of poliomyelitis

MIGRATION OF PROJECTILES IN THE BLOOD STREAM

WE recorded recently[1] a case, reported by an American surgeon in France, of the migration of a fragment of shell from the femoral vein to the right ventricle The condition remained unsuspected until the autopsy The story has been capped by Dr Specht surgeon to a German military hospital, who found[2] a shell fragment in the *left* ventricle at the autopsy on a man who died of sepsis after a deep wound of the thigh In this case the foramen ovale was widely open and the fragment must have passed through the aperture to the position beneath the flap of the mitral valve where it was found The man lived ten days after his injury but no symptom whatever had pointed to any involvement of the heart Dr A Rudolf Jaffe assistant surgeon at the same hospital, relates a series of interesting cases from German literature of which the most remarkable was recorded by Freund and Caspersohn, who removed from the lumen of the right ventricle a shrapnel ball 13 mm in diameter In this case, although the wound was situated at the edge of the right costal arch in the nipple line, and the projectile might therefore have entered the right ventricle directly, the surgeons found no sign of wound of the heart wall nor effusion into the pericardium, and concluded that the ball had entered the vena cava, thus reaching the ventricle indirectly As the patient recovered no opportunity offered for verification of this assumption Jaffe adds a case observed by himself, in which a Russian rifle bullet, wounding the pelvis near the posterior spine of the ilium, entered the inferior vena cava and was carried thence to the right ventricle, where it was found at the autopsy lying beneath a flap of the tricuspid valve No thrombus was present, but the endocardium and valve were swollen and blood stained In this case the patient had complained during life of pain over the heart The occurrence of free projectiles in the blood stream, although doubtless very rare, has already become something more than a surgical curiosity, and its possibility may well be borne in mind by those who observe anomalous symptoms after gunshot wounds, especially when the projectile is not found

POISONING BY CYANIDE GAS

POISONING by hydrocyanic acid taken by the mouth is a common occurrence, but the recorded cases of poisoning by hydrocyanic acid gas are few The latter danger is, however, gaining in importance in view of the introduction by the U S Public Health Service of cyanide gas for ridding ships of parasites, including rats and fleas[1] In the *Medical Journal of Australia* Dr A M McIntosh has reported a case which may serve as a warning against the use of this method without extreme precaution Some rooms in Brisbane were fumigated by cyanide gas under the supervision of a chemist experienced in this work A small room of 1300 cubic feet was being treated The cyanide was placed in a dish, the water and sulphuric acid mixed, and the mixture poured on to the cyanide The room had previously been sealed, excepting one door for exit, and the addition of the fluid to the cyanide caused a great evolution of gas, with the result that the operator inhaled sufficient of it to make him dizzy He immediately dashed from the room and called to his assistant to close the door and seal it up Assistance was summoned and, on arrival, it was found that he had quite recovered from the effects of his inhalation, but when the room was visited the assistant was seen lying on the floor unconscious, with his head near the dish containing the cyanide This was about three minutes after the principal had left the room The assistant was quite unconscious, his breathing had stopped, his pulse could not be felt, and he had lost his corneal reflex He was hurriedly pulled out of the room and carried into the open air Under artificial respiration he began to breathe, at first slowly, oxygen was administered and strychnine sulphate, gr 1/20 hypodermically When discovered his face was very pale, later it became more pink than normal His breathing, at first 6 to the minute, gradually increased to normal rate and was stertorous His pulse gradually became stronger and his corneal reflex returned A pinkish, frothy mucus collected in his mouth, and necessitated constant cleaning out of the throat for some two hours He was given a hypodermic injection of atropine sulphate (gr 1/100) with the is gaining ground that chest wounds are more fatal than was at first supposed Whatever this mortality may be, the deaths almost all occur in the first month No figures, he says, have been collected for deaths from hæmorrhage and severe injury in our field ambulances, but it is probable that 10–15 per cent may die in medical units from the severity of their injury and a further 10 per cent at the casualty clearing station from complicating sepsis Médecin chef Duval, from an analysis of nearly 3500 hospital cases, agrees in giving the general mortality at 20 per cent, reaching 25 per cent or more of the cases retained at the *postes de secours* The first day accounts for at least a third of the deaths, the first and second for nearly two thirds Both observers find the mortality largely influenced by the nature of the projectile, for the battles of the Somme Duval places the percentage death rate for rifle bullets at 5–15, for other missiles 25 Lung wounds with a closed chest wall were fatal in 15, with an open wound in 27 per cent of cases Both the French and English authorities recommend an early cleansing operation as a preventive measure against the appallingly high death rate of infected chest wounds treated conservatively Colonel Elliott mentions two surgeons whose pioneer work has already shown that these thoracic operations are practicable under military conditions in the field Médecin chef Duval suggests, as an alternative, rushing the cases down to the clearing station after applying a simple occlusive dressing, his book contains a full exposition of the methods he uses, and of recovery in cases which might well have been considered hopeless This chapter of war surgery is as promising in its possible results as it is new and fascinating in its practice

THE MEDICAL EXAMINATION OF AVIATORS FOR THE AMERICAN ARMY

THE United States is rapidly preparing a stupendous addition to the air forces of the Allies 30,000 aeroplanes with the requisite men is the smallest figure mentioned, and this number might be sufficient to have a decisive effect on the war The pioneer of aviation, Wilbur Wright, asserts that if the United States could put 10,000 aeroplanes into immediate service the war might be brought to an early conclusion In the *Cleveland Medical Journal* for August Dr W B Chamberlin has described the medical examination of recruits for the American air service, which is characterised by that thoroughness and sagacity which we have learnt to expect from our new ally in all her preparations for war For the air service she is demanding practically the perfect man He must have had two years' college work or its equivalent In addition to the usual physical requirements he must have perfect hearing and sight without the aid of glasses Still more important, he must have a correct sense of equilibration Without this a man might easily be eligible for almost any branch of the Army service Up to the present the tests for aviators in America have been crude The United States is probably the first great Power to call in experts outside the Army Medical Corps to formulate tests Her requirements to day are more rigid and exacting than those of any other nation. Man's knowledge of his position in space is gained from three sources —muscle sense, eyesight, and vestibular apparatus The importance of the latter to the aviator is great because under certain conditions he receives little help from the two former Seated in his machine he receives small aid from his muscle sense, while his frequent passage through clouds or at night in complete darkness may deprive him of the sense of orientation gained through the eyes He has become for the moment the bird flying through fog or mist or the bat flying by night He must depend entirely upon a sense of equilibration given by an unimpaired vestibular apparatus The American recruit is therefore put through Bárány's tests. Seated in the revolving chair with eyes closed and head tilted 30° forward (bringing the horizontal semicircular canals into the plane of turning) he is revolved 10 times to the right in 20 seconds When the chair is brought to rest and vision directed on a distant object horizontal nystagmus to the left should occur for 26 seconds A variation of 8 seconds more or less is allowable The test is then repeated in the opposite direction Pointing is then tested If the normal individual, with eyes closed, extends his arm straight before him and touches the examiner's finger he can bring his arm to the perpendicular and again touch the examiner's finger without deviation to the right or left This test is made for both the right and left arm The recruit is now turned 10 times to the right When the turning has ceased he is directed to touch the examiner's finger and touch it again after bringing the arm to the vertical He will now point several inches to the right This is called "past-pointing" The normal subject will past point three times to the right and then again point correctly The test is made with both arms It is then repeated after turning to the left If the recruit past points more or less than three times he is rejected The vertical semicircular canals are tested by inclining the head 90° forward, thus bringing them into the plane of turning, and the recruit is turned 5 times to the right in 10 seconds On raising his head or body to the vertical it inclines to the right The recruit is then turned to the left and the test repeated Failure in these tests means rejection In borderland cases resort is had to Bárány's caloric test

POLIOMYELITIS IN ENGLAND A REVISED MEMORANDUM BY THE LOCAL GOVERNMENT BOARD

IN view of the recent occurrence of cases of acute poliomyelitis in a number of different districts in England, the issue by the Local Government Board of a revised Memorandum on the disease is opportune The Memorandum contains an up to date résumé of the chief characteristics of the malady, together with valuable suggestions on preventive measures It is recommended that sanitary authorities should be prepared to give facilities for the examination by competent bacteriologists of materials derived from the sick. Stress is laid on the importance of lumbar puncture being performed as early as possible in acute cases where there is doubt in the diagnosis between cerebro spinal fever and poliomyelitis In the former the presence of the meningococcus is characteristic of the disease, in the latter this organism is never found in the spinal fluid, but there is in the fluid an excess of lymphocytes The importance of early serum treatment of cerebro spinal fever is another argument in favour of lumbar puncture being performed in all doubtful cases where the possibility of this disease cannot be excluded by other methods of diagnosis As poliomyelitis can be recognised by

Lieutenant Colonel W Watkins Pitchford, S A M C, Director of the South African Institute for Medical Research, whose observations are published in the *Medical Journal of South Africa*. From their paper it appears that the severe prevalence of malaria among the Union troops returning to Johannesburg from German East Africa offered opportunities for giving a trial to Rogers's method of treatment, and to the possibility of freeing malaria carrying convalescents from the resistant gametocyte forms of the parasite. These experts treated all cases of crescent infection with tartar emetic injections,[1] and in their paper they publish the outline case histories of the first 25 patients. Combined with the tartar emetic given intravenously, quinine in doses of from 10 to 15 grains was administered by the mouth. They state that their results appear to confirm the suggestion of Rogers that tartar emetic when administered intravenously leads to a disappearance of the gametocytes of subtertian malaria, but the treatment has no marked effect upon the trophozoites of this parasite, nor upon those of benign tertian. Their observations do not permit them to express any opinion as to the influence of the drug upon the gametocyte stages of other than the subtertian parasite. The generally recognised resistance of crescents to quinine, they remark, was well illustrated in several of their cases. That these crescents are susceptible to the action of tartar emetic injections is suggested not only by the fact of their disappearance but also by the detection of broken up forms in certain instances. Owing to the demand for beds in the Wanderers' Hospital, where the malarial cases were treated, it was necessary to discharge the men as soon as their recovery seemed reasonably complete. This necessity, unfortunately, restricted the number of consecutive and negative blood examinations which could be obtained before discharge. In many instances the total number of examinations was considerably less than would have been made if more assistance had been available.

THE TRAINING AND SUPPLY OF MIDWIVES

A LARGE and increasing proportion of births among the poorer classes—almost three quarters of the total—are attended by midwives. Happily, the vast majority of births take place without any untoward incident, but childbirth, although a perfectly natural process, is, like other natural processes, liable to accidents, perversions, and sudden emergencies, most of which are easily remedied or averted if recognised and taken in time and provided skilled control is available, but which may be destructive to mother and child alike if the necessary skilled assistance is unavailable, or when meddlesome or ignorant interference is substituted for it. How the midwife is to be fitted to render this skilled assistance was the theme of a memorandum presented by Dr E W Hope, medical officer of health for Liverpool, at the recent annual meeting of the Association for Promoting the Training and Supply of Midwives, and now reprinted in pamphlet form.[1] Dr Hope has long been well known for his effective presentation of the view that the midwife is an essential factor in every scheme affecting the welfare of maternity and infancy, and that her potentialities must be recognised and applied to the best purpose if such schemes are to command success. The need for a raised standard of midwifery skill is evident in the records of the gynæcological wards of any hospital, and the midwife's influence does not end with the confinement. Attending as she does upon the mother and the baby for a period of not less than 10 days, her influence may be of the utmost consequence in obtaining treatment for the sequelæ of venereal disease, and thus ensuring that a succession of miscarriages and stillbirths shall give place to the birth of living and healthy children. Dr Hope touched in his address on the question of the class from which the midwife is recruited, speculating on what induces her to enter upon a calling involving much work for little reward. Some, he finds, have a vocation for midwifery, some, perhaps 15–20 per cent, have succeeded to a practice from the mother, others take it as the only means they know of earning a few pounds. A fairly large proportion of married women take up midwifery in order to meet increasing domestic expenses caused by additions to their own families. The economic result is summarised in a sentence:- It is hardly possible under existing circumstances for a reasonable livelihood to be earned by midwives. Dr Hope queries whether the need for the midwife is likely to diminish owing to the attendance in the future by medical practitioners of all maternity cases and the provision of hospital establishments to obviate the necessity for births taking place in the undesirable homes of the patients. He concludes that there is not the least possibility of either of these things happening. With progressive housing operations homes will not be so undesirable, and in any case hospitals are never likely to meet the needs. There never have been enough doctors to go round in many populous English centres, however overstocked the ranks of the profession have been in more favoured localities, and to the usual wastage must be added the loss of those who have fallen in the war and the sapping of the normal supply at its source. Recognising, then, that the midwife is essential, Dr Hope sees the solution of the problem of supply in a free or subsidised vocational training of perhaps two years, as is already the case in France and Denmark, a terminal examination to give evidence of fitness to practise, followed by a guarantee of a livelihood by means of a payment over and above the fee received from each patient. The subsidised and trained midwife would be expected to undertake practice wherever she was sent, but by the method of subsidising a free choice would still be left to her clients, whilst there would be no inducement to her to shirk nor to undersell. The cost of such a scheme to the Exchequer is estimated by Dr Hope as between £80,000 and £100,000 per year. He commended the consideration of some proposal of this kind to the Association as a piece of constructive policy, and it will be a matter of regret if serious thought is not directed to these very reasonable propositions.

THE National Health Insurance Commissioners have made regulations establishing arrangements for treatment by medical practitioners of all sailors and soldiers (including those who are uninsured) invalided from service with the Forces. These arrangements provide special facilities whereby such men can obtain the services of a doctor without delay immediately upon discharge, and they also include special provision for the treatment in sanatoria of discharged men suffering from tuberculosis. We have dealt elsewhere with the official notifications.

---

[1] Liverpool C Tinling and Co

result that the exudation was greatly checked The *temperature* was now about normal, the face slightly flushed, and the respiration continued laboured and stertorous All his limbs were flaccid, urine and fæces were passed involuntarily, and the pupil reacted sluggishly to light Later in the afternoon general convulsive seizures began, closely resembling those of tetanus, with a typical risus sardonicus They lasted about five minutes, and recurred at intervals of 10 minutes He was given two injections of morphine, 1/4 gr in all This somewhat diminished the violence and frequency of the convulsive seizures Next day the patient could swallow a little and was given brandy and water at intervals He was still passing urine in the bed On this day the spasms were much less frequent and severe Lumbar puncture was performed, 14 c c of normal fluid being withdrawn under slightly increased pressure The Babinski reflex was positive on both sides The knee jerks were very sluggish, there was no ankle clonus Towards evening the breathing became more and more stertorous He was very restless during the night, moaning at intervals, the spasms also occurred with greater frequency The urine was found to contain a considerable amount of pus, but no trace of hydrocyanic acid On the succeeding days the spasms recurred with less frequency and of diminishing severity During the spasms he moaned as if in pain The *temperature* gradually rose, the heart was normal throughout A short time before death some moist sounds were heard at the bases of the lungs The pulse became much weaker and the patient died 110 hours after inhalation of gas The temperature rose to 106° F before death. The necropsy showed a slight congestion of the cerebral convolutions and pyelitis due to old gonorrhœal infection Some of the blood was submitted to the Government analyst, who was unable to find the slightest trace of hydrocyanic acid or any of its compounds

THE LIMIT OF SAFETY OF LEAD IN WATER-SUPPLIES

IN an interesting note which we have received from Dr John C Thresh, medical officer of health of the Essex County Council, he points out that it is not generally known that certain natural waters contain traces of lead in solution. As far as his experience extends these waters are always derived from mountain limestone in neighbourhoods where veins of galena are met with The amount of lead varies between 1 part in 12½ millions and 1 part in 25 millions, equivalent to 1/178th and 1/357th of a grain per gallon of water Dr Thresh quotes several authorities on the question of the limit of safety for the lead content of a potable water, who conclude in general that a water containing 1/100th part of a grain per gallon or even 1/300th part of a grain might be injurious to health, but he suggests grave reasons for doubting whether such a conclusion is correct The amount of lead shown on a single sample may, likely enough, be far below the average amount found in the water, and in one of Dr Thresh's cases the water often contained 1/5th grain of lead per gallon These *observations* refer apparently to waters which had taken up lead in passing through service pipes, and such waters may at one time contain even less than 1/300th of a grain per gallon, yet at others may contain even as much as 1 grain per gallon On the basis of a daily intake for drinking purposes of 3 pints of water, a person would consume 137 gallons per annum, and hence to ingest 1 grain of lead from a water containing 1/100th of a grain per gallon the consumer would have to drink at this rate for nine months, or for over two years if the water only contained 1/300th of a grain per gallon Dr Thresh observes that the kidneys of any individual adult or child which could not eliminate the metal at this rate would be in such a condition that he would be unlikely to live long enough to accumulate a poisonous dose of the metal, and he quotes Sir William Osler to the effect that "lead is rapidly eliminated by kidneys and skin," and that "children are relatively less liable and females more liable to suffer from lead poisoning than men" In Dr Thresh's opinion, when a natural *hard* water contains lead in a less proportion than 1 in 5 millions it may be passed as being practically free from lead and perfectly wholesome so far as the lead contents are concerned In the case of *soft* waters which take up lead from supply pipes he does not think it would be wise to pass a water containing 1 part per million, unless it was perfectly certain that the water was being so treated that this amount was never exceeded There is to be reckoned with also the possibility of a natural hard water carrying from time to time particles of sinter containing lead in suspension As is pointed out, in the neighbourhood of lead mines, used or disused, it is not unusual for cattle to be poisoned by lead Such lead does not appear to be in solution but in suspension, which is removed by careful filtration In one instance in a spring water Dr Thresh found 1 part of lead in 5 millions, but after filtration it only amounted to 1 part in 25 millions

INTRAVENOUS INJECTIONS OF TARTAR EMETIC IN MALARIA

THE recent observations of Sir Leonard Rogers
in Calcutta showed that in certain malarial cases
malignant tertian crescents disappeared from th
blood after the use of intravenous injections
tartar emetic, and also that the same method
treatment was effective in cases of benign tert
infection He suggested that quinine should
employed to check the malarial paroxysm, w
tartar emetic should subsequently be used
venously in order to destroy, if possible, the
corpuscular stages of the parasites—that
crescents of subtertian and the corresp
resisting forms of other types—thus pr
relapses and greatly reducing the infectio
the patient to malaria-bearing mosqui
methods of Sir Leonard Rogers have
other experts, but not always with the
G C Low and H B Newham, of the L
of Tropical Medicine, have placed on
in which tartar emetic, although
and more numerous doses than
by Rogers, failed to have any
rings or crescents Professor J

has also made trial of this me
but came to the conclusion that
tions of tartar emetic did not in
disappearance from the perip
stage of the malarial parasite
or *P falciparum*, nor did thes
either the rigors or the fever
A more recent contribution
supplied from South *Africa*
Orenstein, S A M C, medical
of the Wanderers' Hospital,

question does not fall within the scope of this study, nor can any attempt be made here to deal with difficulties which may possibly arise from the use of Greek words through the medium of Latin

In many cases, then, the meaning of a name is of importance, only in so far as it ensures shortness and simplicity It is quite otherwise with names of relation, in which the meaning of the name may be instructive, e.g , os frontale, os temporale, os coccygis os ischii (It will be noticed that the B N A. employs either the genitive or the adjective, but the former is certainly the more vivid, e.g , os frontis, os temporis, and it also simplifies the names of related structures)

II —*The Direct Method illustrated in the Naming of the Bones and Cartilages*

Just as the bones are the framework upon which the whole body is built up, so the names of the bones are the framework of all anatomical nomenclature. Other structures and parts of the body may be named from the bones and in some cases the bones are named from the region in which they are found Often however a bone must be named on some entirely different principle, such as from its function as in the case of the atlas and axis vertebræ or from its physical resemblance to some object such as a boat plough sieve wedge cube and so on It is natural then in considering the principle enumerated above, to make a rapid survey of the names of the bones with which the cartilages may well be included

1 *Names of Complete Bones and Cartilages* —In naming a bone from its physical resemblance to some object the B N A adopts two methods

(A.) *The direct method* —In the direct method the bone is called by the actual name of the object which it is supposed to resemble, and it must of course be named after one object only If the resemblance is marked so much the better but at least the name is *short and simple* and the genitive case and adjective are easily formed, as is well seen in the following examples —

B N A	*Genitive*	*Adjective.*	*Meaning*
Vomer	Vomeris	Vomerinus.	Plough
Radius	Radii	Radialis	Spoke
Fibula	Fibulæ	Fibularis	Brooch pin
Patella.	Patellæ	Patellaris.	Limpet
Malleus	Mallei	Mallealis	Hammer
Incus	Incudis	Incudalis	Anvil
Stapes	Stapedis	Stapedius.	Stirrup

(B) *The indirect method* —In the indirect method the name is formed by combining the word os bone with an adjective expressing the resemblance e.g —

B N A	*Meaning*
Os naviculare	Navicular or boat-shaped bone.
Os lunatum	Lunate or moon-shaped bone.
Os pisiforme	Pisiform or pea shaped bone
Os cuboideum	Cuboid or cube-shaped bone.
Os ethmoidale	Ethmoidal or sieve-shaped bone

The indirect is the inferior method, since the name is longer the genitive is clumsy, and the adjective is always some sort of a compromise e g —

B N A	*Direct*	*Meaning*
1 Os naviculare Ossis navicularis Navicularis	1 Navicula Naviculæ Navicularis	1 Boat
2. Os lunatum Ossis lunati Lunatus	2. Luna Lunæ Lunaris	2 Moon
3 Os pisiforme Ossis pisiformis Pisiformis	3 Pisum Pisi Pisalis	3. Pea.
4 Os cuboideum Ossis cuboidei Cuboideus	4 Cubus Cubi Cubalis	4 Cube
5 Os ethmoidale Ossis ethmoidalis Ethmoidalis	5 Ethmus Ethmi Ethmalis	5 Sieve
6 Os cuneiforme Ossis cuneiformis Cuneiformi	6 Cuneus Cunei Cunealis	6 Wedge
7 Os sphenoidale Ossis sphenoidalis Sphenoidali	7 Sphen Sphenis Sphenalis	7 Wedge
8 Os sesamoideum Ossis sesamoidei Sesamoideus	8 Sesame Sesamæ Sesamalis	8 Sesame
9 Cartilago thyreoidea Cartilaginis thyreoideæ Thyreoideus	9 Thyreus Thyrei Thyrealis.	9 Shield
10 Cartilago cricoidea Cartilaginis cricoideæ Cricoideus	10 Cricus Crici Cricalis	10 Signet ring
11 Cartilago arytænoidea Cartilaginis arytænoideæ Arytænoideus	11 Arytæna Arytænæ Arytænalis	11 Jug
12 Cartilago triticea Cartilaginis triticeæ Triticeus	12 Triticum Tritici Triticalis	12 Wheat grain

2 *General Terms Applied to Parts of Bones and Cartilages* —In naming parts of bones and cartilages the B N A frequently employs the direct method and with excellent result e g —

B N A	*Meaning*	*B N A*	*Meaning*
Spina.	Spine.	Rostrum	Beak.
Dens	Tooth	Concha	Shell
Cornu	Horn	Ala.	Wing
Malleolus	Little hammer	Hamulus	Hooklet
Condylus	Knuckle	Cochlea.	Shell.
Corona.	Crown.	Jugum.	Ridge.
Caput	Head	Ramus	Branch
Squama	Scale	Collum	Neck.
Sella.	Saddle	Trochlea.	Pulley
Lingula.	Little tongue	Acetabulum	Cup

In the case of the second cervical vertebra the superiority of the B N A. term dens or tooth over the British odontoid process is obvious On the other hand, there are in the B N A. many failures, e g —

B N A	*Direct*	*Meaning*
Processus spinosus	Spina.	Spine
Processus mammillaris.	Mammilla	Nipple
Processus xiphoideus	Xiphus	Sword
Processus pterygoideus	Pteryx	Wing
Processus pyramidalis	Pyramis	Pyramid
Processus condyloideus	Condylus	Knuckle
Processus coronoideus	Corona.	Crown
Processus styloideus	Stylus	Style
Processus alaris	Ala	Wing
Processus coracoideus	Corax	Crow
Pars petrosa	Petra	Rock
Lamina cribrosa.	Cribrum	Sieve
Lamina papyracea	Papyru	Papyrus
Cavitas glenoidalis	Glene	Cup

3 *Complete Names of Parts of Bones and Cartilages* —The complete name of the part of a bone or cartilage consists of a general term combined with the name of the bone or cartilage itself The B N A does this at haphazard with either the genitive or the adjective, e g —

B N A with Genitive	*B N A with adjective*
Manubrium sterni	Planum sternale
Spina ossis sphenoidalis	Lingula sphenoidalis.

In all such combinations the genitive is to be preferred and direct forms should always be used In many instances the B N A. is eminently satisfactory, e g —

B N A	
Spina scapulæ	Condylus tibiæ
Trochlea femoris	Ala vomeris

More often perhaps the B N A fails, e g —

B N A	*Direct*
Processus spinosus vertebræ	Spina vertebræ
Processus condyloideus mandibulæ	Condylus mandibulæ
Processus xiphoideus sterni	Xiphus sterni
Processus pterygoideus ossis sphenoidalis	Pteryx sphenis
Processus coronoideus ulnæ	Corona ulnæ
Processus styloideus radii	Stylus radii
Processus alaris ossis ethmoidalis	Ala ethmi
Lamina cribrosa ossis ethmoidalis	Cribrum ethmi
Lamina papyracea ossis ethmoidalis	Papyrus ethmi
Cavitas glenoidalis scapulæ	Glene scapulæ

The names may be even more complex, e g (*a*) for a portion or part of a bone , (*b*) when part of a bone is in relation with some other structure, e g —

B N A	*Direct*
(*a*) Laminæ processus pterygoidei ossis sphenoidalis	Laminæ pterygis sphenis.
(*b*) Crista ethmoidalis maxillæ.	Crista ethmalis maxillæ
Facies cerebralis ossis sphenoidalis.	Facies cerebralis sphenis

4 *Names of Bones and Cartilages Employed in Forming Names for other Structures* —If the names of the bones were simple and short the names of many other structures could be shortened and simplified, e g —

B N A	*Direct*
Articulatio ossis pisiformis	Articulatio pisi
Articulatio calcaneocuboidea	Articulatio calcaneocubalis
Ligamentum cuboideonaviculare	Ligamentum cuboscaphale
Ligamentum navicularicuneiforme	Ligamentum scaphocuneale
Musculus thyreoarytænoideus	Musculus thyreoarytænalis
Musculus cricothyreoideus	Musculus cricothyrealis
Arteria thyreoidea	Arteria thyrealis.
Arteria ethmoidalis	Vena ethmalis
Vena chorioidea	Vena chorialis
Emissarium condyloideum	Emissarium condylare
Nervus pterygoideus	Nervus pterygalis
Nervus ethmoidalis	Nervus ethmalis
Cisternæ subarachnoidales	Cisternæ subarachnales

III —*The Direct Method as a General Principle in Anatomical Nomenclature*

If the principle that ‘Every name shall be descriptive and as short and simple as possible were adopted throughout anatomical nomenclature much rubbish’ could rapidly be removed A few examples must suffice

STUDIES IN ANATOMICAL NOMENCLATURE,

WITH A VIEW TO AN INTERNATIONAL NOMENCLATURE BASED UPON THE B N A

BY WM CUTHBERT MORTON, M A, M D EDIN,
HONORARY DEMONSTRATOR OF ANATOMY, LEEDS UNIVERSITY

Introduction to the Studies

"A NEW nomenclature ranks low in the registers of fame As a work of mere patience and industry, it aspires to no lustre or *éclat*, it promises no immortality to its author, nor secures to his name any enviable marks of distinction Its influence extends to what must appear only a speck in the map of science, and yet even there, if it should facilitate the progress of study and remove only a part of the rubbish that obstructs the journey, the author will consider his object as attained "

So wrote Dr John Barclay when he published "A New Anatomical Nomenclature" in 1803, and so, no doubt, would he be writing were he alive to day, for we may be sure he would still be publishing, not in the fond hope of winning distinction or immortality for himself, but simply from the desire to help the student by removing even a part of the rubbish that obstructs the journey

Both in the British and in the Austro-German nomenclature (which latter is commonly known as the B N A) the names are too often based upon unessentials and unilluminating, inconsistent with the facts and incompatible with each other The British nomenclature, however, has done long and faithful service, and now that it is fighting for its life against the Austro-German, he would, indeed, be a traitor to science in Britain who did not, if he could, prick the bubble of the Teutonic reputation for superiority Recent events have revealed the Teutons in a light surprising to many who have never had the opportunity of close acquaintance with the Teutonic scientist. For years the Teutons have catered wholesale for the wants of post-graduates and in this way have drawn to their Universities thousands of young men from all parts of the world This pilgrimage of the nations has led the willing Teutons to believe that their country is the Mecca of science and civilisation There is one civilisation and one science and the Teuton is its prophet That is their creed, and so loudly and so incessantly have they been proclaiming it that none can have failed to learn it, and many have come actually to believe it
